The air around with beauty.

Among the other *chef-d'œuvre*, the best perhaps are, the Knife-grinder, the Fawn, the Wrestlers, and Niobe and her Children. The collection of paintings comprises superb specimens of all the best schools, and is said to surpass even that of the Vatican. When speaking of this gallery, Mr. Maclaren observes:—"Persons like myself, with no pretensions to connoisseurship, will feel how poor and vulgar the pictures of the *framontane* artists are when placed beside the works of the great Italian masters in this gallery. Among those who admire the Dutch and Flemish painters for their correct and faithful representation of individual nature, and their skill in chiaroscuro, there are few, I venture to think, whose taste, after some weeks spent in perambulating the picture galleries of Rome or Florence, will not undergo a metamorphosis—few who will not feel a strong preference for what is called the 'ideal' or 'grand style'—for the saints, prophets, Madonnas, holy families, sibyls, and goddesses of the Roman, Florentine, and Lombard artists, which are in truth impersonations of the noblest attributes of humanity,—maternal love, heroic fortitude, intellectual energy, sublime benevolence, and rapt devotion. The same probation will probably also create a predilection in sculpture for the naked figure, and induce a belief that the artist's labour is thrown away upon togas and tunics, however gracefully folded,—that it is the kernel,

* These measurements are taken from the plan of the Museum given in Hakonell's *Picturesque Tour in Italy*.

not the husk,—the man, not his drapery, which is the well-spring of beauty and the recipient of character. Such at least was my own experience. The study of the works of the great Italian masters has this fine moral effect, that it emboloes our conceptions of the capabilities and destiny of man. It puts the doctrine of immortality on canvas, and presents it to the eye. I was delighted with Guido's female heads, which seemed to me radiant with grace and sweetness, purity and beauty, even beyond those of Raphael. The Italian schools are less rich in landscape, yet in this department who can surpass Salvatore? I had no adequate idea of this great artist's genius till I saw nearly a dozen of his large pieces in the Pitti and Corsini palaces in Florence. They seemed to have all the splendour of Claude's, with the addition of that lofty, bold mountain scenery which a Scotsman is apt to consider as essential to the highest class of landscape." The great gallery communicates by a covered passage not only with the *Palazzo Vecchio*, separated from it by a street, but also with the Pitti palace, though on the other side of the river, being carried over the latter by the *Ponte Vecchio*, or old bridge.

Besides the Riccardi and Laurentian libraries, the Magliabechi library, containing a rare, extensive, and valuable collection of books, is open to the public: it is placed below the grand gallery.

Florence is subject to fogs in the winter; but in spring and autumn it is a delightful residence, well provided with every thing that can gratify the man of taste and science, or the voluptuary. It has manufactures of silks, straw hats, articles of alabaster, *scagliola* and *pietre dure*, perfumery, jewellery, artificial flowers, porcelain, engravings, and other objects of the fine arts, &c. The literary and educational institutions are numerous and important. At the head of these is the academy *Della Crusca*, established in 1582, to which has been united the ancient university of Florence. The name *Crusca* (chaff, or husk of corn), has been assumed by this academy, in allusion to the grand object of its institution, the sifting or purifying of the Italian language. This academy published, in 1612, in 1 vol. folio, the first edition of the celebrated lexicon, entitled *l'vocabolario della Crusca*, the fourth and last edition of which appeared in 6 vols. in 1729-38; a work which, though perhaps not quite perfect, has been generally admitted to be the standard of the Italian language. (*Tiraboschi, Storia della Letteratura Italiana*, viii. 511. edit. 1793.) An edition of the *Vocabolario della Crusca*, including numerous words selected from the authors quoted by the academy, but omitted by them, was published at Naples in 1746, in 6 vols. folio. This is preferred by some to the genuine *Vocabolario*. (*Tiraboschi, ubi suprà*.) Besides this famous academy, there are in Florence a *Scuola di Belle Arti*, or school of the fine arts, a medico-chirurgical school, an atheum, and a number of other literary societies. A school was opened in 1830 for the instruction of the poorer classes, on the principle of mutual instruction; and an institution was founded in 1823, under the especial patronage of the grand duke, for the instruction of girls from 7 to 12 years of age; they are educated with great care, and are said to be instructed in all that has a tendency to make them active and provident mothers. There are a great number of other schools and institutions for the instruction of students in the higher branches of education. The charitable institutions are numerous, extensive, and well conducted. Among others, is the *Monte di Pietà*, founded in 1495; a founding hospital; a workhouse, on a large scale, established by the French government, &c. The *Fraternità della Misericordia* is an institution in which the higher classes undertake various duties in relation to the poor. The *Palazzo dei Podestà*, the ancient government-house, is now converted into a prison.

The common people of Florence are well clothed, and have a comfortable and agreeable appearance; and there are, as compared with most other Italian towns, few beggars, rascals, and monks. The citizens are said to be friendly, cheerful, and hospitable. The mild and liberal government of its present princes, the good police they have established, and the encouragement given to all sorts of learning, have conferred advantages on Florence unknown in most other parts of Italy. All sorts of foreign publications are met with here; and the facilities it affords for gratifying a taste for the fine arts, the beauty and security of the town and environs, and its salubrity and cheapness, make it, on the whole, a more desirable residence than Rome, and have attracted to it a great number of English families.

The origin of Florence is not clearly ascertained; but it owed its first distinction to Sylla, who planted in it a Roman colony. In the reign of Tiberius it was one of the principal cities of Italy, and was distinguished by its writers and orators. In 541 it was almost wholly destroyed by Totila king of the Goths. About 250 years afterwards it was restored by Charlemagne. It then became the chief city of a famous republic; and was for a lengthened period in Italy what Athens had been in

Greece in the days of Xenophon and Thucydides. At length, in 1537, the Medici, from being the first of the citizens, became the sovereigns of Florence. Her fate has been thence identified with that of Tuscany.

Florence has produced more celebrated men than any other town of Italy, or perhaps of Europe: among others, may be specified Dante, Petrarch, Boccaccio, Villani, Cosmo, and Lorenzo de Medici; Galileo, M. Angelo, Leonardo da Vinci, Benvenuto Cellini, Alberti, Lapo Brunelleschi, Giotto, Andrea-del-Sarto, Macchiavelli; Popes Leo X. and XI., Clement VII., VIII., and XI., &c. (Besides the authorities already referred to, see *Corder's Italy*, ii. 320, &c.; *Wright's Travels*, 393, &c.) FLORIDA, an extensive peninsula of N. America, stretching S. from the 30th to the 25th deg. of lat., forming the extreme S.W. territory of the U. States; but, exclusive of the peninsula, the territory includes a tract adjoining it on the N. and W., and is comprised between lat. 25° and 31° N., and long. 80° and 87° 35' W.; having N. Alabama and Georgia, E. the Atlantic, S. the channel of Florida, and W. the Gulf of Mexico, and a small portion of Alabama. Length N.W. to S.E. about 650 m.; average breadth about 84 m.; area, 54,500 sq. m. Pop. (1850) 54,730; (1859) 48,223.

The Gulf of Mexico which sets from the Gulf of Mexico round the S. and S.E. coasts, has in the course of ages worn away the land, and formed the low sandy islands generally known by the name of the "Florida Keys," or *Martyrs*, separated from the main land by a navigable channel which, however, is both difficult and dangerous. There are a few good harbours, the best of which are those of Pensacola and Tampa on the W., and of St. Augustine, and St. Mary's on the E. coast. Florida is naturally divided into two different zones, about the 28th deg. of lat. The surface of the portion N. of this parallel, is more elevated, broken, and wooded, than that on its S. side, which is generally level and marshy, and may be termed the true palm-tree section of the U. States. The centre rises into hills of no great elevation, which slope gradually towards the Gulf of Mexico and the Atlantic, and N.W. towards the body of the Continent; but as we proceed towards the S., the whole surface becomes a dead, flat, and, in great part, indurated plain, terminating at the extreme point of the peninsula in heaps of sharp rocks, partially covered with shrubby plants.

The chief rivers are the St. John's, Apalachicola, Suwanee, St. Mark's, and Conecuh. The St. John's partakes more of the character of an inlet or sound than of a river, from the number of lakes formed by its enlargements. Its chief branch, the Ocklawaha, appears to rise near the centre of the peninsula, and flows in a N.W. direction for about 80 m., when it unites with the St. John's proper, which rises within a few miles of the ocean, and the united water, after a tortuous course of 130 m., falls into the Atlantic, near the N.E. extremity of the territory.

A curious fact, though a fresh-water stream at its mouth, it is often rendered brackish towards its head from the waters of the Gulf of Mexico being driven by the winds into the lagoons and marshes among which it has its sources. Both branches of this river are navigable for some distance above their junction, but have little commercial value. The Apalachicola has its estuary in that portion of the territory W. of the peninsula. It has a course of about 100 m. N. to S. within the territory, but does not possess a depth of water proportionate to its magnitude. This river is considered to form the boundary between E. and W. Florida. There are several lakes, of which the Macao, near the centre of S. Florida, and Lake St. George, an enlargement of the St. John's river, are the principal.

The whole peninsula appears to rest upon a base of shell-limestone of comparatively recent formation and different degrees of hardness. The soil on the banks of the rivers is often very fertile; but the proportion of good land is, notwithstanding, believed to be but small.

In the N. and W. Florida there are a few curious, but finely variegated and fertile tracts, and the country is often richly wooded. The most valuable district of the territory is a tract of about 150 m. in length by 30 m. in breadth in W. Florida, nearly in the centre of which is Tallahassee, the capital. There are some very extensive swamps and savannahs, particularly the swamp of Okefonoc, half in Florida and half in Georgia; and there are also some very extensive marshes.

The climate of the N. parts, though hot, has been represented as good, and the air as being always elastic and pure. The winters are so mild that it is never necessary to house cattle. In the S. snow never falls, and frost, although it sometimes occurs, is rare. During July, August, and September, the heat is very oppressive, and fevers are prevalent. But St. Augustine, however, in the N.E., has a healthy climate, and is resorted to by invalids.

The chief agricultural products are—rice, Indian corn, tobacco, indigo, cotton, and hemp; the olive, vine, pine, shaddock, and other tropical fruits, are successfully cultivated, and in some of the occupied maritime districts the sugar-cane and coffee. Large herds of cattle are reared.

Much fine timber, besides pitch, tar, and turpentine, are obtained from the forests; the coasts and rivers produce a great variety of fish and *testacea*.

In 1838, the value of the exports of all kinds was 129,532 doll., and that of the imports, 168,690 doll.

The territory is divided into 4 districts and 20 counties. Tallahassee is the capital. Pensacola, St. Augustine, and Jacksonville, are the other chief towns: all of these are in the N. In 1838, there were 11 banks in the territory, with a united capital of 13,800,000 doll. From the St. Mary's river, which divides Florida at its N.E. angle from Georgia, a canal, 250 m. in length, extends N.E. to S.W. across the peninsula to Apalachicola Bay. A railroad, 12 m. in length, between Lake Wimlico and St. Joseph's, was completed in 1836, and another from Jacksonville to St. Mark's, 160 m. in length, is in the course of being constructed.

Neither the settlement nor the pop. of Florida has advanced so rapidly as might have been expected. This has been occasioned by a variety of causes, among which may be specified the unhealthiness of the climate, the inferiority of a great deal of the soil, and the attacks of the Indians. A circumstance the latter, conducted under circumstances of great barbarity on both sides, has been carried on for a few years past. But, notwithstanding the protection afforded them by the nature of the country, there can be little doubt that the Indians will be finally exterminated, or forced to emigrate to some other quarter.

The legislature is vested in a council of 27 members, elected annually in October, which meets at Tallahassee, where the governor resides. The county courts are held half-yearly, by judges who have a limited civil jurisdiction, and original jurisdiction in matters regarding property. A court of appeals is held annually at Tallahassee. The whole territory sends one delegate to congress.

Florida derives its name from *Pascua Florida*, or Palm Sunday, the day on which it was discovered by Juan Ponce de Leon, in 1512. Its name was for some length of time applied by the Spaniards and Italians to the whole W. coast of N. America. It remained a Spanish possession until 1763, when it was ceded to the British, soon after which it was divided into E. and W. Florida. In 1783 the whole territory was restored to Spain. In 1819 negotiations were opened for the transfer of Florida to the United States; and in 1821 a treaty was ratified by which it became a part of the union, but has not yet been received as a state. (*Darby's View of the U.S.; American Encyclopedia; American Almanac*, 1836-39, &c.)

FLOUR (ST.), a town of France, dép. Cantal, cap. arrond., on a basaltic plateau, 42 m. N.E. Aurillac. Pop. 4,980. It is ill-built; streets narrow and gloomy. Its public edifices are, however, generally handsome. Among these are a cathedral, episcopal palace, diocesan seminary, Jacobin convent, Jesuit college, hospital, subprefecture, &c. It is well furnished with water. It is the seat of the departmental court of assize, and of tribunals of original jurisdiction and commerce. (*Hugo, art. Cantal; Guide du Voyageur*.)

FLUSHING (Dut. *Vlissingen*), a fortified sea-port town of Holland, prov. Zealand, on the W. Scheldt, near the S. extremity of the W. Waicheren, 4 m. S.S.W. Middelburg; lat. 51° 26' 42" N., long. 30° 34' 37" E. Pop., according to some authorities, 7,000; but the *Encyc. des Gens du Monde* makes it only 4,900. It is strongly fortified; besides its own ramparts, it is defended, together with its fine harbour, by several adjacent forts, and provided with sluices, by means of which the surrounding country may be inundated. The town is well built, but presents little worthy of notice, most of its best public buildings having been destroyed during the bombardment by the English in 1809. Its port is extensive, safe, and has deep water. Two canals, communicating with it, enable the largest merchant-vessels to penetrate into the town, and unload on the quays close to the warehouses. A strong wall of masonry protects the town against the sea; the side facing the Scheldt is embanked with great care, and kept in repair at an enormous expense. Flushing has a dock, yard, and a naval arsenal; and is the seat of an admiralty board. It has a somewhat extensive trade with both the E. and W. Indies, and continual communication, by means of packet-boats, with the other sea-port towns of Holland; it has also a considerable trade with England, and is the *entrepôt* where the Geneva intended to be smuggled into this country is principally laid up. Few towns have suffered so severely from war and inundations. It hoisted the standard of revolt against the Spaniards, immediately after the capture of the Briel in 1572. Together with some other towns, it was given to England by the Prince of Orange in 1688, and remained in our possession till 1616. From 1609 to 1814 it belonged to the French. Since 1809 its fortifications have been greatly improved, and, in conjunction with the Fort of Hammekens to the E. and those of Brekens on the opposite side of the river, it now completely commands the mouth of the W. Scheldt, or *Hout*. Flushing was the birth-place of the

celebrated Dutch admiral, De Ruyter. (*Barrow; Cassin's Voyages*.)

FOCHABER, a village of Scotland, co. Moray, and par. of Ballie, on a rising ground on the Spey, 4 m. from its embouchure in the Moray Frith, 8 m. E. Elgin, and 60 m. N.W. Aberdeen. Pop. 1,060. The town consists of two wide streets, crossing each other at right angles, and having a square in the middle. The par. church and a Rom. Cath. chapel are the only public buildings belonging to it. An elegant bridge which spans the Spey was partly swept away by the great floods of 1829, but has since been rebuilt. Indeed, the whole district, through which the river flows suffered severely from these inundations. The bridge in question, which was erected in 1801 at a cost of 18,000*l.*, has four arches, of which the two smallest have each a span of 75 ft., and the two in the middle a span each of 95 ft. Gordon Castle, the splendid residence of the ancient house of Gordon, and now the property of the Duke of Richmond, is in the immediate vicinity of Fochabers; a circumstance to which the town owes its origin and any importance that may attach to it. Fochabers is a burgh of barony, governed by a baron-bailie nominated by the noble proprietor of Gordon Castle. (*Forsyth's Beauties of Scotland*, iv. 453.)

FOGGIA (so called from its corn magazines, *fosse*), a city of S. Italy, k. Naples, prov. Capitanata, of which it is the cap. and seat of its governor; almost in the centre of the great Apulian plain, 46 m. E. by S. Campobasso, 21½ m. S.W. Manfredonia, and 80 m. N.E. by E. Naples. Pop. (1832) 30,687. It is a well built and paved; the streets are wide and clean; the shops large and well supplied; and the whole has an air of opulence, prosperity, and population, which, in spite of its ill-chosen situation and bad air, gives it a more animated appearance than any other city in the whole kingdom, after the capital. (*Craven's Tour*, &c., p. 62.) It has a handsome *intendenza*, or palace, where the governor resides; many excellent private houses, a Gothic cathedral, and about twenty other churches; a good custom-house and theatre; and the remains of a palace which, together with a large well, was constructed by the Emperor Frederick II. The corn magazines, for which Foggia is noted, are very extensive; they stretch under all the large streets and open squares, consisting of vaults lined with masonry, and their orifices closed up with boards and earth. Being situated in a fruitful country, and traversed by roads leading to Naples, Bovino, Brindisi, Manfredonia, Pescara, &c. Foggia has a considerable trade, principally in corn, wool, cheese, cattle, wine, oil, capers, and other agricultural produce. Its consequence always has been, and still is, owing to its being a staple market for corn and wool, and the place at which is collected the toll upon the sheep annually passing into the Capitanata. The *dogana*, or register-office, at Foggia has the distribution of a fixed assessment upon the numerous flocks of sheep that descend in autumn from the mountains of Abruzzo into the plains of Puglia, where they winter, and in May return to the high country. (*See ABRUZZO*.) This duty, which is one of the richest sources of revenue of the crown of Naples, originated with the ancient Romans, who, when they obtained possession of the country, it continued uninterruptedly to be collected till the 13th century, after which, for about two centuries, the passage appears to have been open without fee to all shepherds who chose to bring down their flocks. Under Alphonso I., however, the crown resumed its rights; and having purchased a considerable extent of pasture land, formed the *tavoliere*. (*See APULIA*.) The Abruzzi shepherds, who came down with their flocks into the *tavoliere*, paid a fixed rate per head for their sheep; but had not the power to dispose of their wool, lambs, cheese, or any other commodity produced during their winter residence, in any fair but that of Foggia, where they were to be deposited in the royal magazines, and not touched without a permit. By way of compensation on the part of the crown, besides other privileges, no wools in the kingdom are suffered to be brought to market, till those at Foggia are vendued, the duties paid, and the tribunal satisfied of all its demands. (*Swinhurne*, i. 136-145.) In consequence of these oppressive and absurd regulations, the fair of Foggia, holden from the 8th to the 20th of May, is an important mart, and attended by a great number of commercial and other visitors. Foggia is the seat of the superior criminal court for the prov., and of the tribunal of commerce for Apulia.

This city appears to have been founded in the 9th century, and peopled from *Arpi* or *Arretium*, an ancient city 4 m. distant, said to have been founded by Diomed, which surrendered to Hannibal after the battle of Cannæ, and of which some faint vestiges are still extant. Foggia was greatly enriched by the Sualban princes of Naples. It was sacked in 1268 by Charles of Anjou, who died there in 1286. It was nearly destroyed by the earth-

* The Dict. Gêog. says it is a fortress of the 4th class. Swinhurne, in 1777, says it is "without walls, citadel, or gates!"

quake of 1731. (*Rampoldi*, li. 69.; *Swinburne*; *Craven's Tour in the S. Provs. of Naples*, pp. 61.—63.)

FOLDVAR (an. *Lussumium*), a town of Hungary, co. Tolna, on the summit and declivity of a hill, on the right bank of the Danube, 49 m. S. Buda. Pop. 8,980. It has a Rom. Cath. high school, and a prison; it belongs, together with its lordship, to the university of Pesh.

FOLIGNO (an. *Puliginum*), a town of Central Italy, Papal States, deleg. Perugia, in the Val-Spoletano, and on the Flaminian Way, 20 m. S.E. Perugia, and 14 m. N. by W. Spoleto. Pop. (1832) 15,400. It is walled, but its ramparts and bastions now serve only for public promenades. Its streets generally intersect each other at right angles. There are few public buildings worthy of notice. The cathedral, commenced in the last century, is still unfinished; there are 8 other churches, 20 convents, a town-hall, and a cabinet of antiquities. There are numerous paper-mills turned by the Toppino; and the town has manufactures of woollen cloth, silks, parchment, and bleached wax, and a considerable trade in cattle. The vicinity abounds with vineyards, and olive and mulberry plantations. This city appears to have been anciently of some importance. It was considerably augmented on the destruction of the adjacent town of *Forum Flaminii*, by the Lombards, in 740. It was united to the seat of Rome in 1430. (*Rampoldi*; *Craven's An. Italy*, i. 268.; *Bourving's Report*.)

FOLKESTONE, a bor., sea-port town, and par. of England, co. Kent, lathe Shepway, hund. Folkestone; on the Straits of Dover, 62 m. S.E. by E. London, and 7 m. W. by S. Dover. Lat. 51° 5' N., long. 1° 9' E. Area of par., 4,360 acres. Pop. of do., in 1831, 4,296. The town is built between two precipitous chalk cliffs, on ground rising gradually from the coast: and consists chiefly of 3 narrow and irregular streets, principally extending up the declivities of the W. cliff, on the summit of which is the church, in the early Gothic style, with a tower from the centre. There are also 3 dissenting chapels, and a free school for 20 poor children, founded in 1674. Market, Thurs., in a commodious market-house, built within a recent period by the Earl of Kidnor. The chief employment of the inhabitants is fishing; but this has considerably fallen off, and the town at present is far from being in a flourishing state. There is a pier-harbour, formed at an expense of upwards of 50,000*l.*; but it is so choked up with shingle, as to be accessible only to small coasting vessels. The beach is favourable for bathing, and in summer a few visitors resort thither for that purpose. The village of Sandgate, 2 m. W. of it, is, however, a far more favourite and frequented place. The S.E. Counties' Railway from the metropolis to Dover is being conducted through the parish, partly by means of tunnelling and excavations. There is a strong modern battery on the heights, and the line of coast is defended by 3 Martello towers. Folkestone has been a member of the cinque port of Dover from a period previous to the reign of Henry I. Average annual corporation revenue 234*l.* 1*sh.* Under the Municipal Reform Act it is governed by 4 aldermen and 12 councillors: and its limits, which extended along the coast 2½ m. on the E. side of the town, and to Sandgate on the other, being at the same time considerably contracted in those directions and extended inland, so as to include the Hamlet of Ford, on the line of road to Canterbury, and about ¼ m. from Folkestone. The Reform Act associated Folkestone with the bur. of Lythe in the privilege of returning 1 m. to the H. of C. The town has suffered much at different periods from encroachments of the sea. William Harvey, the discoverer of the circulation of the blood, was a native of Folkestone, having been born here on the 1st of April, 1578: the charity school, endowed by his nephew, was built from a bequest left by him for the purpose.

FONDI (an. *Fundis*), a town of S. Italy, k. Naples, prov. Terra di Lavoro, on the high road between Naples and Rome, near the confines of the Papal States, and on the Appian Way, which now forms its principal street; 11 m. N.E. Terracina, and the same N.W. Gaeta. Pop. 5,000. All travellers agree in speaking in dispraise of Fondi. It is a miserable town, near a pestiferous lake (the an. *Lacus Fundanus*), which renders the air unwholesome; add its inhab. generally are in a wretched condition, though the neighbourhood is abundantly fertile in every kind of produce. This, in fact, is the *Cæcubæ ager*, anciently so famous for its wine—

*Cæcubum, ex prælo domitiam Calene
Tu libes uvam.*

Hor. l. Od. 20.

(See also li. Od. 14.; and *Martial*, xlii. Ep. 15.) But, like the town, the wine has sadly degenerated, and is now quite unworthy the encomiums lavished on its ancient growths.

Fondi is surrounded by the remains of walls of a Cyclopean structure, particularly described by Swinburne (i. 307, 308.). It has a Gothic cathedral, a college, and 2 houses of charity. It obtained the privileges of a

Roman city, A. U. C. 417. In 1222, it was burnt by the adherents of the Emperor Fred. II. It has several times suffered from invasions by the Turks, especially in 1584, when they made an unsuccessful attempt to carry off Julia Gonzaga, Countess of Fondi. (*Rampoldi*; *Swinburne*; *Craven's An. Ital.*, li. 122.—124.)

FONTAINEBLEAU, a town of France, dép. Seine-et-Marne, cap. arrond., near the Seine, in the forest of the same name, and on the high road between Paris and Lyons, 32 m. S.S.E. the former city, and 8 m. S. by E. Melun. Pop. (1836) 8,021. It is well built; streets wide, straight, well paved and clean; but, excepting the principal ones, they are dull. It has several good churches and other public buildings, two excellent cavalry barracks, a hospital founded by Anne of Austria, an asylum for girls established by Mad. de Montspan, a college, public library with 28,000 vols., public baths, a large reservoir; and at its S. extremity an obelisk erected in 1786, on occasion of the marriage of Louis XVI. and Marie Antoinette. The town has manufactures of porcelain and other earthenware; but it owes all its celebrity, and indeed origin, to the palace or *château* of Fontainebleau, a favourite residence of the kings of France. The precise date of the foundation of the palace is uncertain. It would appear that Robert-le-Pieux created a small house of retirement on the spot towards the end of the 10th century; which, since that time, subject to decay, was rebuilt in the 12th century by Louis VII. Philip Augustus, Louis IX., and other sovereigns, added to it, and it was in particular enlarged and embellished by Francis I. It grew rapidly under the hands of his successors: Henry IV. expended 2,440,850 *liv.* on it; Louis XIII., XIV., and XV. added to and improved it; Napoleon is said to have spent 6,242,000 *fr.* on it between 1804 and 1813; and it has been farther enlarged and embellished by his present majesty Louis Philippe. It is, in consequence, a vast pile, with little harmony among its parts, being, in fact, rather a collection of palaces of different epochs, and in different styles of architecture, than a single edifice. Saracenic, Tuscan, and Greek orders are intermixed and interspersed with the most bizarre and dissimilar ornaments; yet, upon the whole, the building has a striking air of grandeur and majesty, and is a fine royal residence. Six palaces are united by galleries, and enclose six principal courts:—the *Cours du Chêne-blanc*; *des Fontaines*; *Ovale*, or *du Donjon*; *du Chêne-vert*; *des Princes*; and *des Cuvaines*. The largest is the *Cours du Chêne-blanc*, which forms also the principal entrance from the W., and derives its name from an equestrian statue in plaster, erected by Catherine de Medici, but no longer existing. At its upper end there is a remarkably fine flight of stone steps, under which a passage leads to a chapel remarkable for the elegance of its architecture and decorations. It was in this court that Napoleon bade adieu to his guard previously to his departure for Elba in 1814. The *Cours des Fontaines* has on one side the suite of apartments occupied by Charles V. in 1530. The buildings which form the *Cours Ovale* are the most ancient of all; they comprise the hall-room, adorned with paintings by Primaticcio, Nicolo, &c., the library, the king's and queen's apartments, the throne, and council-halls, &c. In one of these rooms the small round table is still shown on which Napoleon signed his act of abdication in 1814. The *Cours de l'Orangerie* is also called the *Cours de Diane*, from a fine bronze statue of Diana in its centre; in the *Galerie des Cerfs*, one of the buildings surrounding it, Mondesclit was assassinated by order of Christina of Sweden. The *Cours des Princes*, the smallest of all, is surrounded by the apartments occupied by Queen Christina. The *Cours des Cuvaines* is large, regular, and enclosed with buildings erected by Henry IV. The palace contains a great number of ancient and modern paintings; it is surrounded, especially on the S. side, by fine gardens, ornamented with fountains and fish-ponds, and traversed by a canal nearly 3-4ths of a mile in length. The forest of Fontainebleau comprises 32,577 arpents, or about 34,200 acres, a part being on the opposite side of the Seine. Its surface is very varied, and in parts very picturesque. It supplies Paris with a small portion of its wood-fuel, and with a considerable part of its paving stone.

The château of Fontainebleau has been the scene of many historical events: Philip IV., Henr. III., and Louis XIII. were born in it; and the first monarch died there. It was visited by Peter the Great; Louis XV. espoused the daughter of the king of Poland in this palace; Pope Pius VII. was confined within its walls for 18 months; and it is intimately connected with the history of Napoleon. It was comparatively neglected by Louis XVIII. and Charles X.; but Louis Philippe has restored it to even more than its ancient grandeur. In 1837 the nuptials of the duke of Orleans were celebrated here with great pomp. (*Hugo*, art. *Seine-et-Marne*; *Guide du Voyageur*; *Encyc. des Gens du Monde*.)

FONTARABIA (properly *Fuenterrabia*), a fortified frontier and sea-port town of Spain, Biscay, prov. Gul-

puscos, on a small peninsula on the left bank of the Bidassoa, at its mouth, 30 m. W. by S. Bayonne. Pop. 2,035. It used to be reckoned one of the keys of Spain; but its walls were levelled by the British troops in 1813. On the side of the sea it is, however, defended by Fort St. Elme, and on the land side covered by a lofty hill. It has a royal palace, now occupied by the military governor and the civil superintendent, a town-hill, hospital, convent, and a fine par. church dating from the 15th century. On the N.E. side of the town is the harbour, which is shallow, and admits only vessels of 40 or 50 tons burden. The principal occupation of the inhab. is fishing. Fontarabla has sustained numerous sieges: its fortifications were greatly augmented by the emperor Charles V.: under Philip IV. it received the rank and title of a city. The auxiliary British legion under General Evans had some severe fighting with the Carlist forces in the vicinity of this town, which they took in 1837. (*Milano's Mod. Trav.*, &c.)

FONTENAY, a town of France, dép. Vendée, cap. arrond., on the V. at the point where it becomes navigable, 42 m. S.E. Bourbon-Vendée. Pop. (1836) 6,389. With the exception of some modern houses, the town is very ill-built; streets narrow, ill-paved, and dirty. The church, with a spire 311 ft. in height, is the object most worthy of notice. The town was originally fortified, and had a castle belonging to the counts of Poitiers, some ruins of which may still be seen. Fontenay is the seat of a sub-prefecture, a court of original jurisdiction, and a communal college; it has linen and cotton cloth factories, tanneries, and breweries, and some trade in timber, charcoal, Bordeaux and other wines, &c. (*Hugo, art. Vendée*, &c.)

FONTENOY, a village of Belgium, prov. Hainault, 4 m. S.E. Tournay. Here, on the 30th of April, 1745, a battle was fought between the allied English, Hanoverian, and Dutch forces, under the Duke of Cumberland, and the French, under Marshal Saxe, Louis XV. and the Dauphin being also with the army. The contest was obstinate and severe. At one time victory seemed to have declared in favour of the allies; and if the English had been properly supported by the Dutch, such would probably have been the case. In the end, however, the French were victorious. "*Les Anglais*," says Voltaire, "*se rallièrent, mais ils céderent; ils quittèrent le champ de bataille sans tumulte, sans confusion, et furent vaincus avec honneur.*" (*Siècle de Louis XV.*, cap. 15.)

The allies lost about 7,000 men killed and wounded, and 2,000 prisoners, on this occasion. The loss of the French amounted to nearly 6,000 men killed and wounded.

FORELANDS (NORTH AND SOUTH), two headlands on the E. coast of the co. of Kent—the first or N. Foreland, forms the N.E. angle of the co.; it projects into the sea in the form of a bastion, and consists of chalky cliffs nearly 200 ft. in height. A lighthouse of the first class, having a fixed light, elevated 340 ft. above the level of the sea, was erected on this headland in 1698. This lighthouse is in lat. 51° 22' 25" N., long. 1° 27' W. The S. Foreland, about 16 m. S. from the latter, consists of chalky cliffs. Two lighthouses, with fixed lights, have been erected on this headland, to warn ships coming from the S. of their approach to the Goodwin Sands. The N. Foreland is made by act of parliament the S.E. extremity of the port of London.

FORFAR, or ANGUS, a marit. co. on the E. coast of Scotland, having E. the German Ocean, S. the Frith of Tay and the co. Perth, W. the latter, N. Aberdeen, and N.E. Kincardine. It is of a quadrangular shape, and comprises 170,880 acres. It is naturally divided into four districts, whereof the first and most extensive, called the "Braes of Angus," comprises all the S. slope of the Grampians, from the summit of the ridge till it loses itself in the valley of Strathmore. The mountains in this division are mostly rounded and tame, but in parts they exhibit bold, terrific precipices. The second division consists of that portion of the valley of Strathmore that lies in this co. between the foot of the Grampians and the Sidlaw hills (*Hills of Angus*), and is for the most part a finely diversified, well cultivated country. The third division consists of a portion of the range called the Sidlaw hills, parallel to the Grampians, and attaining to a height of 1,200 or 1,400 ft. Some of them are conical, detached, and covered with heath, while others are wholly cultivated. "Dunsinnan Hill" is found in this group. The fourth and last division consists of the rich, low-lying, level land between the Sidlaw hills and the sea and the Frith of Tay. Principal rivers are the E. Esk and Isla. No wheat, perhaps, in Great Britain has agriculture and the appearance of the country been more rapidly improved than in this co. The progress made in this respect during the last 40 years has been quite extraordinary. "At the time of the last statistical account much of the land in the parish (Oathlaw, in Strathmore,

and the same is true of the rest of the co.) was in a state of waste, the appearance of the country was bare and bleak, the climate cold and damp, owing to the quantity of water on the land. Most of the houses were at that time of the rudest and meanest kind, built of unhewn stone, and covered with thatch; scarcely one of mason work, or covered with slates. Now the farms are all laid out and enclosed, draining is carried to great perfection, and farm-houses and offices are neatly built and covered. Thriving woods and belts of plantations are rising up, and giving a rich and clothed appearance to the co. Along with all this it is gratifying to observe that the habits of the people are improving. There is a greater neatness and cleanliness in their dwellings, and a greater share of the comforts of life amongst them; and though last, not least, there is evidently an increasing desire of information, and, generally speaking, a higher and better tone of moral feeling." (*New Statistical Account of Scotland*, N. 5. 310.) The vicious practice of holding land in *run-rig* (see *ARVIG*), that formerly prevailed in all the hill districts of this co., is now comparatively rare; and improvements are beginning to be made, where certainly they were much wanted, even in the cottages among the Grampians. There are some great estates, but property is, notwithstanding, a good deal subdivided. Average rent of land, in 1810, 9s. 1½d. an acre. Excepting limestone, minerals are of no importance. This co. has recently become the principal seat of the manufacture of coarse linens, which is carried on to a great extent at Dundee, Arbroath, Forfar, Montrose, and other towns. Forfar contains 5 royal bur. and 56 parishes, and returns 3 mems. to the H. of C.: viz., 1 for the co., 1 for the town of Dundee, and 1 for Montrose and its contributory boroughs. Registered electors for the co. in 1838-39, 1810. In 1831, Forfar had 19,697 inhab. houses; 31,730 families; and 139,606 inhab., of whom 65,063 were males, and 74,513 females. Valued rent, 171,240 Scotch. Annual value of real property, in 1815, 361,341.

FORFAR, a parl. and royal bur. and par. of Scotland, cap. of the above co., in the *How of Angus*, or valley of Strathmore, 14 m. N. Dundee. Pop. (1831) 7,949. It consists principally of one long street, and of a shorter one at right angles to it. "Forfar is a bor. of considerable antiquity, and is likely to continue a thriving place, being in the centre of a well-cultivated country, and having excellent communications on all sides. The command of water power is not sufficient for machinery; hence, though a great proportion of its inhab. are engaged in weaving, it is chiefly in connection with other towns, and not under the regulation of any very extensive establishment upon the spot. Its chief trade is the weaving of Osnaburgs and coarse linens. It has long been famous for the manufacture of a particular kind of shoes called 'brogues,' excellently adapted for the use of a Highland district. The streets are well built, and many new houses are in progress; the tendency of the manufacturer who works at home being to convert his earnings, as soon as possible, into a new town, and the property of his piece of land. These new acquisitions are laid out in a neat and substantial way, and bespeak the appearance of comfort at least, if not of wealth. Fuel is water-borne, and the nearest sea-port is Dundee, 14 m. distant. There are valuable quarries here, the products of which are all sent round to a great distance. On the whole, the present circumstances of this town seem to present every appearance of a regular and steady advancement in its population, trade, and agricultural improvement." (*Bonnie Rep.*) There were, in 1838, 2,830 looms in the town, of which 2,560 were at work. Most of the public buildings in the town, including a new church and spire and county buildings, an episcopal chapel, &c., have been erected within these few years: there are, also, several dissenting chapels. The means of education are extensive and good; the town having an academy for languages, geography, &c., a parish school, a mechanics' institute, Sunday schools, a large infant school, &c.: here also is a subscription news-room, a subscription library, a mechanics' reading-room, &c. Forfar is now connected by a railway with Arbroath. It is governed by a provost, 2 bailies, and 16 councillors. Corporation revenue in 1839, 1,350*l*. Forfar unites with Montrose, Arbroath, Brechin, and Bervie, in sending 1 m. to the H. of C. Registered parl. electors, in 1838-39, 279; municipal ditto, 279.

FORÌ, or FORIO, a sea-port town of the Neapolitan dom., on the W. shore of the island of Ischia, cap. distr. of same name. Pop. 6,000. Streets very narrow, but the houses are solidly built, and there are 3 good churches, all very much decorated. It has a good harbour, and some trade with Naples, Leghorn, Genoa, &c. In its vicinity there are some hot mineral springs, used as baths.

FORLÌ (an. *Forum Livii*), a town of Central Italy, Papal States, cap. leg. of same name, in a fertile plain between the Montone and Reno, on the Emilia Way, 38 m. S.E. Bologna, and 15 m. S.W. Ravenna; lat.

* The account of this battle by Voltaire, referred to above, is extremely interesting; but such is not the case with his poem entitled *La Bataille de Fontenoy*; it is wholly destitute of interest and imagination, and deserves the name given to it of a *gaucis rime*.

44° 13' 26" N., long. 12° 1' 20" E. Pop. (1852) 16,000. It is surrounded by old walls; is generally well built; has 4 spacious streets; a square, in which there are several fine buildings; a cathedral; 9 other churches; and numerous convents. Many of the private residences are built of marble, and the streets are ornamented with arcades. The ceiling in the council-chamber of the town-hall was painted by Raphael. Forli is the seat of a cardinal-legate, and a court of primary jurisdiction dependent on a superior court at Bologna. It has manufactures of plain silk riband and silk twist, and of oil-cloth, woollen fabrics, wax, nitre, and refined sulphur. It also trades in corn, wines, oil, hemp, and aniseed, which, as well as its manufactures, is considerably facilitated by a canal from Arcuaviva. There is here a college, a public library, and some learned societies. Forli was founded anno 205 n. c. It was annexed to the see of Rome by Pope Julius II. In 1797, the French made it the cap. of the dep. of the Rubicon. It was reunited to the Roman dom. in 1815. (*Rampoldi; Dict. Geog.; Bowring.*)

FORLINPOPOLI (an. *Forum Populi*), a town of Central Italy, Papal States, leg. Forli, 5 m. S.W. that town. Pop. 4,000. It has an ancient castle, a cathedral, 2 parish churches, and several convents. This and the other forums in different parts of Italy, are supposed by Sigonius to have been all *conventi*, or assize towns; but the proximity of those on the Emilian Way, particularly of Forli and Forlinpopoli, seems, as Mr. Forsyth has remarked, to contradict that opinion. (*Forsyth's Italy*, p. 460.)

FORMOSA, (Chin. *Tae-wan*, or "Terrace Bay,") an island in the Chinese Sea, belonging partly to China, between lat. 22° and 25° 30' N., and long. 120° 30' and 122° E.; about 80 m. from the Chinese coast, from which it is separated by the Channel of Fo-kien, and 170 m. N. Luzon, the chief of the Philippine Islands. Length, N. to S., about 250 m.; breadth, in its centre, about 80 m. Area, 15,000 sq. m. Pop. uncertain, but perhaps between 2,000,000 and 3,000,000. (*Canton Register*, 1833.)

A chain of mountains runs through the island in its entire length, forming, in general, the barrier between the Chinese on the W., and the independent natives of the unexplored country on the E. side. On many of its summits, snow remains during most part of the summer, and Humboldt has supposed that a portion of it reaches an absolute elevation of upwards of 12,000 ft. It exhibits distinct evidence of former volcanic action in some extinct craters; in other parts fumes, mephitic gases, &c. burst out of the earth; and sulphur, naphtha, and other volcanic products are abundant. Some parts of the coast present bold headlands, but all the W. shore is flat, and surrounded with rocks and quicksands. Its harbours, which were formerly very good, have become nearly useless, except to junks of very small tonnage, from the rapid increase of the land on the sea; so that, at present, Formosa has but one good port, that of Kelung, at its N. extremity.

"That portion of Formosa which is possessed by the Chinese well deserves its name; the air is wholesome, and the soil very fruitful. The numerous rivulets from the mountains fertilise the extensive plains which spread below; and throughout the island the water is unwholesome, and, to unacclimated strangers, it is often very injurious. All the large plain of the S. resembles a vast well-cultivated garden. Almost all grains and fruits may be produced on one part of the island or another; but rice, sugar, camphor, tobacco, &c. are the chief productions. Formosa has long been familiarly known as the granary of the Chinese maritime provinces. If wars intervene, or violent storms prevent the shipment of rice to the coast, a scarcity immediately ensues, and extensive distress, with another sure result—multiplied piracies by the destitute Chinese. The quantity of rice exported from Formosa to Fuh-keen and Che-keang is very considerable, and employs more than 800 junks. Of sugar there annually arrive at the single port of Teen-tsin (in China) upwards of 70 laden junks. The exportation of camphor is likewise by no means small. Much of the camphor in the Canton market is supplied from Formosa." (*Chinese Repository*, li. 419, 420.) Besides the foregoing products, wheat, maize, millet, kitchen vegetables of many kinds, truffles, &c.; *colocasia*, a kind of arum, the root of which is a chief article of food in the interior; oranges, bananas, cocoa and areca nuts, peaches, figs, melons, and numerous other European and Asiatic fruits are cultivated. Chestnut woods are plentiful; and in the N. especially, a good deal of timber for ship-buildings is obtained. Pepper, aloes, coffee, a kind of green tea, but different from the Chinese, cotton, hemp, and silk, are other important articles of culture. The ox and buffalo are used for tillage and draught; horses, asses, sheep, goats, and hogs, are abundant. The leopard, tiger, wolf, &c. inhabit the island, but do not infest its cultivated portion; pheasants, hares, and other kinds of game are very numerous. Gold is supposed to be found in the E. part of Formosa, as it is seen in the hands of the in-

hab.; but the chief minerals are salt and sulphur, of which latter a good deal has been sent to China since 1819, for the manufacture of gunpowder.

The Chinese colonists of the island are mostly from the opposite prov. of Fo-kien, and have emigrated principally from poverty. They are a laborious and industrious race, well-disposed towards foreigners, but very turbulent in respect to the home authorities, who maintain only a very precarious sway over them,—the Formosans having frequently risen in open rebellion against their mother-country. The greater part of them are cultivators of the soil; but many of the Amoy men (from which district a great number of the emigrants have come) are merchants, fishermen, and sailors. The trade with China is very extensive: the chief exports to that country have been mentioned; the principal imports thence are tea, silk, and woollen, and other kinds of manufactured goods. The trade is mostly in the hands of Fo-kien merchants, who have also advanced the chief part of the capital necessary for the cultivation of the soil. As many as 100 junks a month are estimated to leave Fo-kien for the W. coast of Formosa; where, however, they are obliged to lie at a great distance from the shore, while carts with wheels, destitute of spokes, drawn by buffaloes, are used to carry the cargoes to them through the water. There are no junks strictly belonging to the island; all the shipping is the property of the Amoy merchants. (*Gutzlaff*.)

The native inhab. of the E. of Formosa bear no resemblance to the Chinese; but they have apparently an alliance with the Malay or Polynesian tribes. "They are of a slender shape, olive complexion, wear long hair, are clad with a piece of cloth from the waist to the knees, blacken the teeth, and wear ear-rings and collars. In the S., those who are not civilised live in cottages of bamboo and straw, raised on a kind of terrace 3 or 4 ft. high, built like an inverted funnel; and from 15 to 40 ft. in diameter. In these they have neither chair, table, bed, nor any moveable. They tattoo their skin. In the N. they clothe themselves with deer-skins. They have no books, no written language; neither have they any king or common head, but petty chiefs and councils of elders, and distinguished men, much like the N. American Indians. It does not appear whether they have any separate priesthood, but it is probable that there is none beyond the conjurers and enchanters of all savage tribes, nor any ancient and fixed ceremonies of divine worship, or system of superstition. They are represented by the Chinese as free from theft and deception among themselves, and just towards each other, but excessively revengeful when outraged." (*Chinese Repository*, li. 419.) The Chinese territory in Formosa having, for a lengthened period, been gradually extending, the really independent tribes have receded towards the E. coast; some of the others have become partially civilised, settled in villages, and intermixed with the border Chinese.

Formosa, together with the Pang-hoo islands, composes a *foo*, or department, under the prov. Fo-kien, and immediately subject to its governor. It is divided into five *Acens*, or districts. The cap., *Tae-wan*, is described as ranking among Chinese cities of the first class in variety and richness of its merchandise, and in pop. It stands on the W. coast, in about lat. 23° N., and long. 120° 33' E., surrounded by a wall and ditch. Its principal streets are from 30 to 40 ft. broad, and for many months of the year are covered with awnings to keep off the sun. On a small island opposite the city the Dutch, in 1634, built Fort Zealand, which commanded the harbour, the entrance to which is now choked up. The Chinese garrison in *Tae-wan*, amounts to about 10,000 men; the total armed force usually stationed in the island may be estimated at about double that number, all infantry. The revenue derived by China from Formosa amounted, in 1820, to 11,240 bushels of corn, and 7,241 os. of silver; the public expenditure to 482 bushels of corn, and 5,000 os. of silver.

The Chinese appear not to have been acquainted with Formosa till about 1430, after which its coasts became the resort successively of several Chinese pirates. The Japanese had planted colonies in the N., and at one period the greater part of the island belonged to them; but the Dutch, having been allowed to settle on the W. coast, gradually dislodged all their opponents, including the Spanish and Portuguese (both of whom tried to gain a footing), and became sole masters of the island about 1632. After the conquest of China by the Tartars, in 1644, a Chinese chief, with an army of Chinese refugees, determined to conquer Formosa, and finally expelled the Dutch from it in 1662. In 1683, however, the new dynasty was overthrown by the continental Chinese, aided by the Dutch; and the authority of China has been ever since maintained over the island, though assailed by repeated insurrections. (*Ritter, Asia Enlarged*, li. 388, 381; *Klaproth; La Perouse; Gutzlaff; Chinese Repository*, &c.)

FORRES, a royal and parl. bor., town and par. of Scotland, co. Moray. The town is situated on the E. side

of the burn of Forres, about 2½ m. E. from the Findhorn, and 2½ m. N. from the loch or inlet of the sea which receives the Findhorn, and 11 m. W. Elgin. Pop. of par. (1831) 3,895, of which the town had 3,434. The town consists of one principal street, with the town-house in its centre, through which the great road to Inverness passes, with several smaller streets branching off from it. It possesses an excellent academy, called Anderson's Institution (from its founder, a private gentleman of that name), which, together with the salubrious climate and cheapness of living, induce many families to reside here. Several villas have been erected in the neighbourhood of the town, which may be considered likely to increase. Forres has no manufactures. Findhorn is the sea-port of the bor. and of the surrounding district. (*Boundary Report*.) Besides the academy, there is a good parish school, an elementary school, and a ladies' seminary. On a hill, at the W. end of the town, are the poor remains of the ancient castle of Forres. About ¼ m. N.E. from the town, is a remarkable granite obelisk, called Sueno's Pillar, consisting of a single stone 23 ft. above ground, 3 ft. 10 in. broad, and 1 ft. 3 in. thick. One side is rudely sculptured. It appears to have been erected by the Scotch in memory of some victory over the Danes. A pillar was erected in memory of Lord Nelson by public subscription on a hill to the E. of the town. A bridge of 4 arches over the Findhorn, near this town, was swept away by the great flood in that river in Aug. 1829. Forres unites with Inverness, Fortrose, and Nairn in sending 1 m. to the H. of C. Registered electors in Forres, in 1839-40, 155. Municipal do., 134. It is governed by a provost, 2 bailies, and 14 councillors. Corporation revenue, 592.

FORT AUGUSTUS, a fortress of Scotland, co. Inverness, the centre one of the three forts erected along the great glen of Scotland now the line of the Caledonian Canal, beautifully situated at the W. extremity of Loch Ness, 31 m. S.W. Inverness, and 29½ m. N.E. Fort William. Fort Augustus was built in 1730, and was so named in honour of the Prince of Wales, father of George III. It is a regular fortification, with four bastions, and barracks capable of containing 400 soldiers, with proper lodgings for the governor and officers. It was taken by the Highlanders in 1746, but abandoned after having been partially demolished. Here the Duke of Cumberland established his camp after the battle of Culloden; and the ruins of a turf-house which he occupied are still to be seen. The fort was ordered to be demolished in 1818; and is now occupied by three or four veteran artillerymen. In its immediate neighbourhood is a village, originally called Kilcummin, from its having been the burial-place of the ancient and powerful family of Cummin; but now it bears the same name as the fort. Pop. about 740. The village is meanly and irregularly built, and forms a contrast to the beautiful situation in which it is placed. (*Mr. Grant's Letters from the Highlands*; *Home's Hist. of the Rebellion*; *Garnett's Tour*, II. 318; *Forsyth's Beauties*, § *Inverness*.)

FORT GEORGE, a fortress of Scotland, co. Inverness, 11 m. N.E. Inverness, on a low sandy peninsula jutting into the Moray Frith, and forming the most E. of the three forts erected along the great glen of Scotland. It is esteemed the most complete fortification in Britain, and not being commanded by any part of the adjacent country, may bid defiance to assault. The work was erected so as to command the entrance to the Moray Frith. The ramparts on three sides rise almost out of the sea, the waters of which may at pleasure be introduced into the fosse, which skirts the fourth side. It has four bastions, mounted with 80 cannon; is a bomb-proof magazine, &c., and accommodation for 3,000 men. The buildings are remarkably neat, and disposed in handsome squares, with a fine walk round the ramparts. The fort occupies no less than 15 acres. It was begun to be built in 1747, under the direction of General Skinner, and cost upwards of 160,000*l*. It was partially used as a state prison during the late war. Though Fort Augustus and Fort William, the other forts on the line of the Caledonian canal, have been dismantled since the peace, Fort George kept in good order, and has a governor and a garrison. (*Forsyth's Beauties of Scotland*, § *Inverness*; *Sioddler's Remarks on Scotland*; *Pennant's Tour*.)

FORT WILLIAM, a fortress of Scotland, co. Inverness, at the E. extremity of Loch Linnhe, and the W. end of the Caledonian Canal. This fort, Fort Augustus in the centre, and Fort George at the E. extremity of the great glen in the line of this canal, were built at different times for supporting the authority of the general government, and curbing the turbulence of the Highland clans. It was originally built of turf, by General Monck, in the time of the Commonwealth, being so large as to contain a garrison of 2,000 men. It was called the Garrison of Luverlochy, owing to its situation at the mouth of the Lochy, a stream which falls into Loch Linnhe. In the reign of William and Mary, it was rebuilt of stone, but on so small a scale as

to afford accommodation to only 800 men. It then received the name, which it has since retained, of Fort William. It is of a triangular form, with two bastions. In the rebellion of 1715, the Highlanders made an unsuccessful attack on it; and in 1746 it stood a siege of five weeks by the adherents of Prince Charles Stuart, who at the end of that time were forced to retreat. The fort was ordered to be dismantled in 1818; and is now tenanted by about a dozen invalids, in order to keep it from becoming a complete ruin. Within 1¼ m. W. of the fort, and on the edge of Loch Linnhe, is the town of Fort William, originally called Maryburgh, and now more generally Gordonsburgh. Pop. about 600, who are chiefly engaged in the herring and other fishery. Ben Nevis, the highest mountain in Britain, being 4,570 ft. high, is in the immediate vicinity of the fort and the town, both of them being placed at its base. Gordonsburgh is the only village or town in this district of Inverness-shire, and is 2½ m. distant from Fort Augustus, the village nearest to it. (*Forsyth's Beauties of Scotland*, § *Inverness*; *Pennant's Tour*; *Garnett's Tour through the Highlands*, I. 302-305; *Home's Hist. of the Rebellion*.)

FORTH, a river of Scotland, which originates in several mountain streams that have their sources on the E. side of Ben Lomond, in Stirling-shire. Its course is E., with many sinuosities, by Aberfoyle, Stirling, and Alloa, till it unites with the arm of the sea, called the Frith of Forth, at Alloa. The Telf, its most important tributary, has its sources a little more to the N., and pursuing a S.E. course past Callender and Doune, joins the Forth a little above Stirling, bringing to it a volume of water but little inferior to its own. Its other most important affluents are the Allan, flowing S. from Perthshire; and the Devot, flowing W. from Kinross-shire. During the latter part of its course, the Forth flows with many windings through a low, level, and very rich country: in fact, though the distance from Stirling to Alloa by the road be only about 7 m., it is no fewer than 23 by water. Steam-boats ascend to Stirling, and ships of 300 tons burden come up to Alloa, which may be regarded as its port.

FORTROSE, a sea-port, royal and parl. bor. of Scotland, co. Ross, on a gentle eminence on the N. bank of the Moray Frith, nearly opposite Fort George, from which it is 2½ m. distant, 8 m. N.E. Inverness. There is a regular ferry between Fort George and this bor. Fortrose was formerly known by the name of Chanonry, so called from its being the chanonry of Ross, where the bishop resided, and the members of the chapter. About a mile to the W. stands the small town of Rosemarkie; and the two places were united by a charter granted by James II. in 1444, under the common name of Fortrose, now softened into Fortrose, which charter was ratified by James VI., in 1592. Pop. of the united bor. and parish, in 1834, 1,813, embracing 358 families, and 331 inhabited houses. Rosemarkie is a meaner place than Fortrose, but is reckoned the parochial capital, inasmuch as it is the site of the parish church. A handsome Episcopal chapel, however, has within the last few years been erected at Fortrose. The Academy there is the first seminary of the kind established in the N. of Scotland, and is supported by donations and subscriptions. The late Sir James Mackintosh received his elementary education here. There are two other schools at Fortrose, and two also at Rosemarkie. There are no manufactures in the place. The salmon and white sea fishery gives considerable employment. No mail or stage coach passes through the parish; but the steam vessels plying in the frith call at Fortrose; and it is by them that salmon and other articles are conveyed thence to Aberdeen, Leith, and London.

The Bishop of Ross resided at Chanonry, and was termed "*Episcopus Rosemarkiensis*." This Episcopal see was founded by David I. in the 12th century. Only a small part of the cathedral now remains. Some of the bishops of Ross were men of literary eminence, particularly John Maxwell, author of *Sacro-Sanctæ Regum Majestatis*, who died in 1646, archbishop of Tuam in Ireland. Fortrose unites with Inverness, Forres, and Nairn, in sending a member to the H. of C.; and in 1839-40 had 55 registered voters. (*Ker's Cat. of Scot. Bishops*, IV. 1824, pp. 184-204; *New Stat. Acc. of Scot.*, § *Ross*, p. 349.)

FOSSOMBRONE (an. *Forum Semprontii*), a town of Central Italy, Papal States, leg. Urbino, on the Metauro, in a fertile district, 7 m. E.S.E. Urbino. Pop. 5,000, chiefly employed in the manufacture of silk, said to be the finest in Italy. It has an old fortress; a fine cathedral, containing many good paintings and interesting inscriptions; 3 other churches; 6 convents, a handsome one-arched bridge, and the ruins of an ancient theatre. Near this town was fought, anno 194 a. c., the great battle between the Carthaginians under Asdrubal, the brother of Hannibal, and the Romans, in which the former were totally defeated, and their general killed. Tradition has preserved the memory of the event in the name of a hill

in the vicinity, called *Monte d'Asdrubale*. This victory may be said to have determined the fate of the long-contested struggle between the Romans and Carthaginians in favour of the former. Fossombrone was destroyed by the Goths, and again by the Lombards, but rebuilt by the Malatesti. That family sold it in 1440 to the Duke of Urbino, with whose territories it was afterwards transferred to the see of Rome. (*Rampoldi; Ancient Universal Hist.* xviii. 61. 8vo. edit.)

FOUAH, a town in the Delta of Egypt, on the E. bank of the Rosetta branch of the Nile, prov. Gharbieh. Though still a considerable village, it lost its importance in the 16th century, when the trade of which it was the seat was transferred to Rosetta. Fouah is most agreeably situated amidst a great number of flourishing villages and productive fields. The river flows past it through one of the widest and most picturesque portions of its channels and banks. (*Champollion, Lettres écrites d'Égypte*, p. 50.)

FOUGÈRES, a town of France, dép. Ille-et-Vilaine, cap. arrond., on a hill near the Nançon, 27 m. N.E. Rennes. Pop. (1836) 8,974. It is well built, has a fine promenade, and is altogether a very agreeable town. A chalybeate spring attracts to it numerous visitors.

Fougères was a strong town in the 15th century, and was considered one of the keys of Brittany till that prov. was united to the French crown. During the last century it suffered from four destructive fires, on which account few of its ancient buildings exist, excepting the ruins of a Gothic castle, which form a very picturesque object. There are here large manufactures of sailcloth and hempen fabrics, flannels of excellent quality, hats, leather, dye-houses, &c. It is the seat of a sub-prefecture, a court of primary jurisdiction, and a communal college. (*Hugo, art. Ille-et-Vilaine*.)

FRAMLINGHAM, a town and par. of England, co. Suffolk, hund. Loes, on an eminence, near one of the sources of the Aisle, 14 m. N.E. Ipswich. Area of par., 4,470 acres. Pop. of decs in 1831, 2,445. Here is an old church, with a tower 66 ft. high; a free school, and several sets of almshouses. Here, also, are the ruins of a magnificent castle, which was a place of importance in the Saxon times, and to which the Princess Mary repaired during the attempt made by the partisans of Lady Jane Grey to place the latter on the throne.

FRANCAVILLA, a town of S. Italy, k. of Naples, prov. Otranto, cap. distr., on a hill, in a fertile but unhealthy territory, 234 m. W.S.W. Brindisi, and 17 m. E.N.E. Taranto. Pop. 11,186. "It is large and regularly built; the streets wide and straight; the houses showy, though in a heavy style of architecture. Since the year 1734, when a considerable part of the town was thrown down by an earthquake, the dwellings have not been raised more than one story above the ground floor. The main street would be thought handsome even in a capital city. The avenues to the gates are well planted, and afford a pleasant shade. The college is a large edifice, with many handsome halls and galleries. The principal par. church is gay and well lighted; but so stuccoed, festooned, and flowery, that the whole decoration is a mere chaos." (*Swinhurne*, 4. 214.) There are 2 hospitals, a charitable asylum, a *mont-de-piété*, and several convents; with manufactures of woollen stuffs, cotton stockings, earthenware, and a kind of snuff similar to that made in Spain. Francavilla was founded in the 14th century, and owes its name to an exemption from taxation for 10 years, granted to all persons who settled in it. (*Swinburne's Travels in the Two Sicilies*, vol. 1.; *Rampoldi*.)

FRANCE (KINGDOM OF), one of the richest, most important, and powerful of the states of Europe, in the W. part of which it is advantageously situated, between lat. 42° 20' and 51° 5' N., and long. 4° 50' W. and 8° 20' E.; having N.W. and N. the English Channel (*La Manche*), the Straits of Dover (*Pas de Calais*), and the North Sea; N.E. Belgium, Dutch Luxemburg, and the Rhenish provs. of Prussia and Bavaria; E. the territories of Baden, Switzerland, and the Sardinian States; S. the Mediterranean and Spain; and W. the Bay of Biscay and the Atlantic. Except on its N.E. frontier, its actual are identical with its natural boundaries; being on the E. the Rhine from the influx of the Lauter to Basle, the Jura mountains, and the Alps to the Mediterranean; the latter and the Pyrenees on the S.; and N.W. and W. the English Channel and the ocean. The shape of France is somewhat hexagonal. Its greatest length N.W. to S.E. (from the extremity of the dép. Finistère to the peninsula

FRANCE.

of Antibes) is 664 m.; its greatest breadth (a line crossing the former nearly at right angles) is 620 m. Length, N. to S., Dunkirk to Perpignan, nearly 600 m.; greatest breadth E. to W. (a line passing from near Lauterburg to Brest, through Paris) about the same; least breadth E. to W. about its centre 335 m. Inclusive of Corsica, which, though belonging naturally to Italy, forms a dep. of France, the total area is estimated, in the official tables published by the French government, at 52,768,618 hectares, or 203,736 sq. m. The pop., which in 1801 was 27,349,000, had increased in 1821 to 30,461,875, in 1831 to 32,569,223, and in 1836 to 33,540,910, of whom 16,460,701 were males, and 17,080,209 females. (*French Official Tables; St. Fargeau, Aperçu Statistique de la France*.)

Physical Geography. Position, Frontiers, Coasts, and Islands.—France is indebted not only to her large population, and the active spirit of her people, but in a great measure to her admirable geographical position, for her commanding influence in European affairs. Unlike any of the other states of Central Europe, she has the command of three seas, including those which wash both the N. and the S. shores of that continent. Her entire line of frontier, by sea and land, is estimated at about 2,840 m. (*Aperçu Statist.* p. 15.) Of this extent, 1,355 m. are on the land side; and being for upwards of 900 m. of that distance enclosed by strong and well-marked natural barriers, the country is in so far well secured and easy to defend against foreign aggression. Of the 1,445 m. of sea-coast, about 360 m. are on the Mediterranean, 565 on the Atlantic, and 560 on the English Channel and North Sea. The N.W. coast presents the two considerable peninsulas of Brittany and Cotentin, the bay of St. Malo between them, the estuaries of the Seine, and the harbours of Morlaix, Cherbourg, Havre, Boulogne, Calais, Dunkirk, &c. From Dunkirk to Calais the shore is bordered by sandy bays. From the latter point to the mouth of the Seine, the coast is chiefly characterized by chalk and marl cliffs; farther W. granitic cliffs alternate with low shelving shores. There is seldom deep water near the shore on this coast; the bay of Cancale near Avranches, for instance, is in a great measure left dry at ebb-tide, and passengers at such times go from the mainland to Mont St. Michel, across the sands, in carriages. The W. part of this coast is beset with rocks; these are especially numerous between the mouths of the Seine and the Vire. Good harbours are few, and navigation is rendered dangerous by violent tides, the force of which is attested by numerous salt marshes along the shore, produced by irruptions of the sea. The W. coast, formed in part by the peninsula of Brittany, is at first elevated, bold, and rocky, but as it proceeds S. it gradually declines, and from the mouth of the Gironde to the foot of the Pyrenees, it presents an unbroken line of sandy downs interspersed with marshes. Besides the Gironde, the Loire discharges on this coast, which is farther indented by numerous bays. The S. coast, except in its E. part, is generally low, sandy, and bordered, where it surrounds the Gulph of Lyons, by numerous lagoons; and its harbours are in general neither well sheltered nor easy of access, though this is by no means the case with Toulon and one or two more. Exclusive of those at the mouth of the Rhone, the islands round France, and belonging to her, are of comparatively little importance; they lie mostly along the W. coast: Oleron, Ré, Yeu, Noirmoutiers, Belle-Ile, and Ouessant (Ushant) being the chief. Those in the Mediterranean are the isles of Hivera, Ratonneau, Poméguet, &c. near Marseilles; and the only ones in the Channel are Brehat, and a few rocky groups in the bay of St. Malo, of which that of Chausey is the principal. Guernsey, Jersey, Alderney, &c. belong to England, and are the only remains of the extensive dominions the English sovereigns once possessed in France. (*Hugo, France Pittoresque; Dict. Géogr. d'Aperçu Statist.*, &c.)

Mountains, &c.—According to Bruguière (*Orographie de l'Europe*), these belong wholly to the Alpine and Pyrenean systems, the line of separation between which is the valley traversed by the canal of Languedoc. The ramifications of the Alpine system in France are therefore far more extensive than those of the Pyrenean; they comprise the mountain ranges throughout the country, except in the S.W. The principal mountain chain, or great watershed of France, intersects the country under the names of the Faucilles, plateau of Langres, Côte d'Or, Cevennes, &c., in a general direction N.E. to S.W.; but running much nearer to the S.E. than the N.W. extremity of the kingdom, which is therefore divided into two very unequal parts. On the N. and W. sides of this chain several considerable branches are given off, as

the Vosges, Moselle, and Argonne ranges, the plateau d'Orléans, and Morvan mountains, which stretch to the extremities of Normandy and Brittany, &c. These ranges separate the principal river basins, those of the Rhine, Moselle, Meuse, Seine, and Loire, from each other; the basin of the Rhine is on the S.E. side of the Cevennes, enclosed between them and the Alps. Connected by ramifications between the Cevennes, there is a group of mountains of volcanic origin scattered over Puy de Dôme, Cantal, and some adjacent depts. In the centre and S. of France. This group, which Balbi and other geographers regard as a separate system, under the title of *Gallo-Francois*, separates the basin of the Loire from that of the Garonne. The highest points of this group have a somewhat greater elevation than those of the Faucilles and Cevennes chain. The Pic-de-Sancy (M. Doré) is estimated to be 6,223 ft. in height, and the Plomb-de-Cantal, 6,095 ft.*; while Mezenec, the loftiest of the Cevennes, is only 5,918 ft. high; Le Heuculet (Jura), 5,633 ft., and the Ballon de Sulz (Vosges), 4,688 ft. The Pyrenees send off numerous lateral branches through the S. E. depts.; their loftiest summit within the French territory is M. Dore, 10,894 ft. in height. But the culminating point in France belongs to the Alps, and is probably M. Olan, 4,214 mètres (*Hugo*), or 13,825 ft. high; next to which is the Pic-des-Ecrins, 13,468 ft. in elevation.

Rivers.—Leaving out of view the Rhine, which can scarcely be called a French river, since it merely runs for about 100 m. along a portion of its E. frontier, France possesses no river to rank with the Volga or the Danube. The principal are the Loire, Rhone, Garonne, Seine, Meuse, and Moselle. Except the Rhone, which has for the most part a southerly course, all the above-named run in a N. or W. direction. The Loire, which is the largest, and traverses the centre of the kingdom, rises in the mountains of the Vivarais (Ardèche), near Mezenec. It runs generally N.W. as far as Orleans, and thence mostly W.S.W., with a somewhat tortuous course to its mouth in the Atlantic. The length of its entire course is about 620 m., of which about 510 m. are navigable. It receives from the N. the Arroux, the Maine (formed by the Mayenne and Sarthe), and the Eure; and from the S. the Allier, Cher, Indre, Vienne, Sevre-Nantaise, &c. Nevers, Orleans, Blois, Tours, Saumur, and Nantes are situated upon its banks. The Rhone rises in Switzerland, beyond the Simplon, and after traversing the Lake of Geneva, and forever for itself a passage through the Alps, not far from Chambéry, enters France S. of the Jura range, forming the entire S. and almost all the W. boundary of the dep. of Ain. From Lyons, where it receives the Saône, the direction of the Rhone is nearly due S. to Arles, where its delta commences; and it falls into the Mediterranean by a double set of mouths, after a course of 530 m. within the French dom., more than 310 of which are navigable. Its principal affluent is the Saône, which runs through Franche-Comté and Burgundy, with an entire course of about 213 m., of which about 165 are navigable. Besides the Saône, the Rhone receives from the N. the Isère; from the E. the Rhône, the Isère, Drôme, and Durance, famous for its rapidity; and from the W. it receives the Erlieu, Ardèche, Gardon, &c. Lyons, Valence, Montellimart, Avignon, Tarascon, and Arles are the chief cities and towns on the Rhone; upon the Saône (which river is augmented by the Doubs), Gray, Chalons-sur-Saône, and Macon are situated. The Garonne rises in the Spanish Pyrenees, near M. Maladeth, and runs at first N.E. as far as Toulouse, but thence onward its course is generally N.W. to its mouth, (or rather the mouth of its estuary, which bears the name of the Gironde,) in the Bay of Biscay, about 55 m. N.N.W. Bordeaux, and 120 m. S.S.E. the mouth of the Loire. The entire length of its course, including the Gironde, is estimated at about 350 m., nearly 294 of which are navigable. It receives some considerable tributaries; as the Tarn, which is navigable for a distance of 90 m.; the Lot, navigable for 130 m.; and the Dordogne, navigable for 120 m. from the E., and from the S. in the earlier part of its course; the Sava, Gimone, Gers, Baïse, &c. Toulouse, Agen, and Bordeaux are situated on the Garonne. The Seine rises in Burgundy, about 18 m. N.W. Dijon: its general course is N.W., but it is exceedingly tortuous, and though in a direct line its course is no more than about 250 m., from its mouth in the British Channel, the windings of the river make its total length as much as 500 m. It enters the channel by a wide and capacious mouth, on the N. of which is the town of Havre: its estuary, and the lower part of its course, is subject to the phenomenon of the *barre*, which sometimes occasions considerable damage. (See *AMAZON, SOLWAY FRITS*, &c.) The principal affluent of the Seine is the Marne; besides which, it receives from the E. the Aube and Oise; and from the S.

and W. the Yonne, Juine, Eure, Rille, &c. Paris, Châtillon, Troyes, Melun, St. Denis, St. Germain, Andely, Elbeuf, Rouen, Honneur, and Havre are situated upon its banks. The Marne, which runs chiefly through Champagne, has a navigable course of 215 m.: it receives the Blaise, Ornain, Ourcq, &c.; Chalons-sur-Marne, Eprenay, Chateau-Thierry, and Meaux are seated on it. Both the Meuse and the Moselle run N. to join the Rhine beyond the French dom.: the former has a navigable course of 162 m., and the latter one of about 72 m. within France. These rivers, however, as well as those of the Escant (Scheldt), Lys, Sambre, and others, belong more properly to Belgium than to France. The Charente, the basin of which lies between those of the Loire and the Dordogne, has a navigable length of about 120 m.; and the Adour, which traverses the depts. of the Pyrenees and Landes, has a great number of tributaries, including the Midouze, Pau, Oleron, &c., and a course generally W., which is navigable for 77 m. The other rivers worthy of any notice, as the Somme, Orne, Aisne, Meurthe, Rance, Vienne, Arige, Ilerault, Var, &c., are referred to under the depts. to which they give their name, or in which their course is chiefly situated. (*Illego*; *Aperçu Statist.*; *Dict. Géogr.*; *Official Public.*)

Lakes, Marshes, &c.—Of the former there are remarkably few, and those quite insignificant in point of size. The largest is that of Grand Lieu, in the dep. Loire Inférieure; but it is only 6 m. across. There are a few small lakes amongst the Jura ranges, and others occupy extinct craters in the volcanic district. In Ain and Loire-et-Cher marshes are numerous. The extensive lagoons on the S. and S.W. coasts and elsewhere have been already alluded to; they are too shallow to be used otherwise than for fishing and salt-works.

Geology, Soil, and Minerals.—Geologically, the whole of France may be considered as one extensive basin, the circumference and centre of which consist of primitive formations, the intermediate space being filled with those of a secondary and tertiary kind. Primitive rocks abound most in the Alps, the Pyrenees, the peninsula of Brittany, and the mountains of the so-called *Gallo-Francois* system in the centre of France. They are, however, met with in a part of Maine and Normandy, in Vendée, in Ardennes, where they are contemporaneous with a chain of primitive rocks which extend into N.W. Germany, in the Vosges, in Dauphiny (Isère), and on the S. coast E. of Marseilles. The most widely diffused primary rocks are granite, gneiss, micaceous and argillaceous schists, and primitive limestone. In Vendée, to the foregoing may be added a great number of others, including porphyry, diorite, eclogite, and serpentines; and in the Dauphiny Alps and the Pyrenees the rocks are said to present a still greater diversity. In the latter mountains calcareous rocks are very abundant; and some of a transition kind contain a great number of organic remains, even at an elevation of 1,600 toises, or 10,230 ft. (*Dict. Géogr.*) Argillaceous schist, also containing numerous organic remains, is prevalent throughout a part of Brittany; granitic rocks predominate at the extremity of that peninsula. Porphyry of various kinds, some of which exhibit great beauty, is the prevailing rock in the Vosges mountains. In the central group of Limousin, Auvergne, &c., gneiss, granites, and micaceous schists are abundant, but differ greatly in their characters from those of the surrounding mountain chains. The Puy de Dôme and some other adjacent mountains have a base of trachite, and in the Vivarais (Ardèche), especially, groups of gigantic basaltic columns are frequently met with in some places alternating with calcareous strata containing fresh water shells. These rocks, together with the traces of extinct craters, the existence of lava streams, and other volcanic products, clearly point to a time of volcanic activity in this region, which has probably had place at no very remote period in the history of our planet. It may here be mentioned that traces of volcanic action have also been met with on the banks of the Rhine, in the Vosges, and in the dep. Var.

The interval between the primitive formations of the centre and circumference of France is almost entirely occupied by secondary formations. These are nearly every where calcareous or marly, generally compact, and often contain a vast number of shells, madrepores, and other organic remains. They compose many long hill-ranges, of no great height, but frequently steep and bare, or covered only by a thin vegetable soil. All Lorraine, and a great part of Franche-Comté and Burgundy, consist of these formations. It is on this kind of land that the growths yielding the finest Burgundy wines are raised in the Côte d'Or. The secondary formations extend through Dauphiny, and on the left bank of the Rhone as far as the Mediterranean, through Languedoc with the Cevennes quite to the Pyrenees; and surrounding the Paris basin, they reach the sea both on the N. and W. coast.

The tertiary deposits of France are highly interesting: they are mostly calcareous, enclosing great quantities of

* According to Bruguère (*Océographie de l'Europe*). The *Faunes des Gens du Monde* gives to the Plomb-de-Cantal an elevation of 6,238 ft., and makes the Pic-de-Sancy 6,187 ft., and Mezenec 5,920 ft. high.

shells and the remains of fossil mammals of large size. The most remarkable of the tertiary formations is what is called the "Paris Basin," which occupies a somewhat circular area nearly bounded by a line passing through Blois, Orleans, Montargis, Provins, Epervan, Laon, Beauvais, Pontoise, and Chartres. A still larger tertiary district is found at the foot of the Pyrenees, including almost all the valleys of the Adour and Garonne, the déps. Landes, Gironde, &c. There are others in the valleys of the Loire, Rhine, Allier, &c. The most extensive alluvial district is that around the mouth of the Rhone.

The soil of France is, speaking generally, very superior. No doubt she has large tracts of mountainous, heathy, and unproductive land; but her productive soil bears, notwithstanding, a larger proportion to the entire extent of the country than in most other European states. According to the official returns, the total surface of France, including Corsica, was, in 1837, distributed as follows:—

Surface.	Hectares.	Surface.	Hectares.
Mountainous	4,269,730	Stony	6,512,348
Heath land	2,291,577	Barren	2,291,577
Rich soil	7,275,364	Clayey	2,257,985
Calcareous	9,788,197	Marshy	281,451
Gravelly	3,417,993	Various	7,290,240
Total	52,765,000 hectares,	or 203,736 sq. m.	

The greatest extent of mountainous surface is found in the déps. of the Alps and Pyrenees, and those of Arlège, Côte d'Or, Drôme, Doubs, Haute Loire, and Haute Marne; heath land prevails most in Basses Alpes, Landes, Gironde, Finistère, and Hérault; calcareous chiefly in Oise, Basses Alpes, Dordogne, Marne, and Vienne; sandy soils in Cher, Haute Loire, Loiret, and Puy de Dôme; and rich lands in Gers, Aisne, Eure-et-Loire, Eure, Marne, Nord, Tarn, and Yonne. France has considerable mineral wealth. The metal most abundant is iron; in 1837 it was obtained in 64 of the 86 déps. Those in which it is most plentifully produced, are Haute-Marne, Haute Saône, Nièvre, Côte d'Or, Dordogne, Orne, Meuse, Moselle, Ardennes, Isère, Cher, Aude, Pyrénées Orientales, Arlège, and Haute Vienne. Two gold mines were formerly wrought, one in the déps. Bas Rhin, and the other in Isère, but both have long been abandoned.

There are also two silver mines, one in each of the above déps., but only that of Allemont (Isère) is at present wrought. Silver is, however, frequently found in the lead mines, which are chiefly abundant in Finistère, and the Rhenish, Alpine, and some of the S. déps. Copper, mercury, zinc, tin, antimony, and manganese, both in large quantities, arsenic, bismuth, cobalt, chrome, &c., are met with; and amongst the rarer metals molybdenum and tungsten, *Wismuth* in Haute Vienne, and *arsenic* near Autun. Coal is very widely diffused. The principal coal-field is in the déps. du Nord, where it forms part of a coal-district 50 leagues in length by 2 broad, extending into Rhenish Prussia. Others exist in the déps. on the Upper Loire, in Aveyron, &c.; coal mines are particularly numerous around St. Etienne. The salt beds discovered about 20 years since in Lorraine, are supposed to extend beneath a surface of 30 square leagues, and will fully supply France for ages. Turf in the N., asphaltum in the E. and elsewhere, naphtha and sulphur in the S., vitriol, alum, nitre, plaster of Paris, porcelain and other clays, graphite, asbestos, jet, and some gems, lithographic, mill, and building stone, excellent marble, slate, granite, &c., are amongst the valuable mineral products. Mining industry will be treated of hereafter.

There are no fewer than 700 (or, according to Hugo, upwards of 1,000) mineral springs, of a medicinal character, though only about 80 of these are frequented by visitors, of whom there are perhaps in all about 40,000 yearly. The principal are the warm sulphureous springs of Barèges, Cauterets, Bagnères-de-Bigorre, and de Luchon, in the Pyrenees; the saline springs of Aix, the chalybeates of Bourbon l'Archambault (Vosges), and Plombières; the cold springs of Englien, &c.

The climate of France is not excelled by that of any other part of Europe. The air is generally pure, and the winters mild; though the differences of latitude, elevation, soil, exposure, &c. occasion, in this respect, very material differences. Generally, France may be divided into 4 regions. The 1st, or most S.—the region of the olive—is bounded N. and W. by a line passing diagonally from Bagnères-de-Luchon in the Pyrenees, to Die in Drôme. The 2d, or region through which the cultivation of maize extends, stretches as far N. as a line drawn from the mouth of the Gironde to the N. extremity of Alsace. The 3d region, which terminates together with the culture of the vine, has, for its N. limit, a line extending from the mouth of the Loire to Moulins in Ardennes. The 4th, or N. zone, comprises the rest of the country. The mean annual temperature of different parts of France has been estimated as follows,

by Humboldt; at Toulon 62° (Fahr.); at Marseilles 59° 50', at Bordeaux 56°, at Nantes 55° 25', at Paris 51° 20', and at Dunkirk 50° 60'. More rain appears to fall during the year on the S.E. than on the N.W. side of the great watershed, the average being, in Isère 32 inches, in Haut Rhin from 28 to 32 in., at Lyons 29 in., and at Montpellier 28 in.; while at Paris, the fall is only 19 in., in Orne 20 in., and in Ille-et-Vilaine 21 in. But notwithstanding this result, the sky is generally bright, and the atmosphere clear in the S.E., and there are at least one-third fewer rainy days than in the N.W., where the atmosphere is almost constantly charged with moisture produced by the W. winds which commonly prevail, and the weather is more or less cold for half the year. The centre of the country enjoys a happy medium of temperature and climate; in the S. the summers are long, dry, and hot. The departments around the Gulf of Lyons are subject to a violent N. wind called, in Provence, the *bise*, the *circus* of ancient writers. According to Mr. Inglis, "this wind is the curse of all these provs., and it is scarcely possible, in travelling through this country, to meet with a greater misfortune than a *bise* wind, especially in the déps. of Languedoc and Auvergne." Its effect upon the frame is singularly disagreeable; it parches the mouth and throat, creates a feeling of suffocation, and seems to dry up the whole juices of the body" (*Inglis's Switzerland*, &c. p. 108.; *Aperçu Statistique*, &c.).

The vegetable products of France are said by Hugo to comprise upwards of 830 genera, and 6,000 species. All these, however, are not indigenous, and many new plants have been introduced within the last two centuries. The most richly wooded parts are the mountainous districts, particularly the Vosges, the plateaux of Languedoc and Orleans, the Cevennes, and the mountains of Auvergne and Limousin. The Alps and Pyrenees, Provence, the S. part of Languedoc, and the W. of France, are but indifferently wooded. The principal forest trees are the oak, elm, beech, maple, ash, walnut, chestnut, birch, poplar, larch, pine, fir, box, cornel, &c. In the Vosges and Jura mountains, Brittany, and the *Landes*, there are extensive forests of fir; the chestnut woods are very fine in Haute Loire. The olive, orange, lemon, pistachio, and carob growth wild in the S., but there only; and the fruits of all are inferior to those of warmer climates. The caper (*Capparis spinosa*), diffused over Provence, furnishes a well-known article of export. Cherries, apples, and several other fruits grow wild; apples and pears are largely cultivated in the N. départements, and prunes in the centre of France. The culture of these and other fruits will be adverted to in a subsequent section.

Mr. Inglis, who travelled through many countries of Europe on foot, has the following remarks on the scenery of France:—"All panegyric upon the loveliness and inspiring fertility of France is rhodomontade. There is more of the beautiful and the picturesque in many a single county of England, or even of Scotland, than in all the scattered beauties of France, were they concentrated within a ring-fence; excepting always the Pyrenees, which I cannot help looking upon as a kind of separate territory—the mere boundary between France and Spain; but at all events the Pyrenees must be excepted. I have travelled through almost every part of France; and truly, I have found its beauties thinly sown. If the banks of some of its rivers be excepted—the Seine, the Loire, the Rhone, and the Garonne—some parts of Normandy, and the departments of the Pyrenees, France is an unromantic, uninteresting, unlovely land. And even in these favoured parts, such as the vaulted Orléannois, where shall we find the green meadows that lie along the banks of our Thames, or Avon, or Severn; or upon which of them shall we pause to admire those romantic views—that charming variety of rock, wood, and mountain—that characterise the banks of the Tamar, the Wyre, the Derwent, the Nile, the Wharfe, or the Dove? These are nowhere to be found. . . . I pity the man who crosses France in any direction. . . . Thousands know how *romantic* is the journey from Calais to Paris; but they who never travel farther, suppose that lovely France, panegyrised by so many, lies beyond. No such thing. Let them continue their journey by whichever road they please, and they will find but little improvement. . . . Châteaux also we have in these provinces (those of the S.), but oh! how different from the châteaux of which we read in the romance writers, and which never existed but in their imaginations! The châteaux are for the most part *boxes* upon a large scale; staring houses with wings, and a parapet wall in front, covered with vases of flowers. In short, we find the whole a delusion; and our minds revert to the green activities of our own hills, our oak forests, our lakes and rivers, and the beauty and fertility that, along with the picturesque, mingle in an English landscape." But if the indiscriminating panegyrics of France have gone too far on the one hand, I suspect that Mr. Inglis has as much overshot the mark on the

other. Mr. MacIaren, than whom there can be no better authority, says that from Châlons-sur-Marne to Avignon the Rhone flows through one of the most beautiful, picturesque, and delightful regions in the world. And there are many other districts in France the scenery of which will bear a comparison with that of any other country.

Animals.—The bear, wolf, and wild boar are the only formidable wild animals now inhabiting France, and the numbers of these have been greatly thinned by the increase of pop. and of civilisation. The black bear (*Ursus pyrenaicus*) is confined to the higher ranges of the Alps and Pyrennees, where the isard, chamois, and wild goat are also found. Notwithstanding an active war of extermination carried on against the wolves, those animals are still very numerous in some departments, as in Morbihan, Sarthe, Vendée, Landes, and the central mountainous departments. In the Cevennes, the lynx is

sometimes found, though rarely. The wild boar, roe-buck, and fox, abound in all well-wooded parts. The red and fallow deer, formerly so plentiful in the royal parks, have become rare; hares and rabbits are extremely abundant. Several kinds of squirrels, the polecat, weasel, otter, marten, hedgehog, and the other small wild animals, common throughout Europe, are as numerous in France as elsewhere; in addition to which, the desman (*mus moschiferus*), an aquatic quadruped, inhabits the neighbourhood of Tarbes, as some beavers do the islands at the mouth of the Rhone. Seals, dolphins, and sometimes whales, are met with around the coasts.

Birds are very numerous. They include two kinds of eagles and a species of vulture. Several birds not elsewhere met with are found on the shores of the Mediterranean, as the flamingo, roller, swamp-eater, becardia, ortolan, &c. Bustards, large and small, inhabit the

TABLE showing the Departments into which France is at present divided, their Population in 1836, their Sub-divisions, the Deputies and Electors in each, and the number of Properties into which they were divided in 1836.

Departments.	Area in Hectares.	Population in 1836.	Arrondissements.	Cantons.	Communes.	Deputies.	Electors in 1838-39.	Properties in 1835.	Capitals of Deps.

déps. of the N.W. and centre. The cock-of-the-wood, and red and grey partridges, are the principal winged game. Water-fowl are particularly numerous in the déps. Vendée and Charente-Inferieure: in cold winters the wild swan visits the country.

Reptiles are few; there are but two venomous serpents. A kind of gecko inhabits the S. shores; the salamander, large green lizard, mud-tortoise and *testudo*. *Testudo*, are the other most remarkable animals of this class. In some déps. frogs are reared in large numbers as articles of food. The fisheries of turbot, sole, ray, mackerel, herring, pilchard, mullet, &c. in the N. and W. seas, and of the tunny and anchovy in the Mediterranean, furnish employment to numerous families. Oysters are very abundant on the N. and W. coasts, as well as muscles and lobsters. Leeches are exported from France in large quantities. There are two species of scorpion. Centaurs and the cochineal insect are met with in the S. (*Hégo, France Pittoresque; Aperçu Statistique; Dict. Géog.*)

Population.—The information with respect to the pop. of France previously to 1784 is exceedingly imperfect. But according to the best attainable information it amounted, in 1700, to 19,669,000, and in 1762 to 21,769,000, including Corsica. In 1784 it was estimated by Necker at 24,800,000.

The official returns give the following numbers for the undermentioned years:—

1801	-	27,349,005	1826	-	31,458,937
1805	-	29,161,822	1831	-	32,569,923
1821	-	30,461,875	1836	-	33,540,910

It appears, therefore, supposing the statement for 1801 to be correct, that the increase of the pop. in the 35 years ending with 1836 had been 6,191,910, or between a fourth and a fifth part of its amount in 1801. Between those two epochs there were born 33,226,422 children, 17,135,444 males, and 16,090,978 females: the deaths during the same period were 27,901,362; 14,229,339 being males, and 13,673,023 females. Of the births, 2,122,940 were illegitimate, the average of these to legitimate births for the same period being nearly 1 to 15 annually. But it must be remarked that the number of illegitimate births, which in 1800 was only 41,635, had in 1831 increased to 74,727; so that while the total pop. had increased only about 1-4th part, the number of illegitimate births had nearly doubled. The proportion of the latter varies greatly in different déps.; it is largest in those which contain the largest cities. The Seine stands at the head of these: in it the illegitimate are to the legitimate births as 1 to 2-66; in that of the Rhône as 1 to 6-91; in Seine-Inferieure as 1 to 7-5. Illegitimate births are fewest in Vendée, where the proportion is only 1 to 62-48. In 1836, the subdivisions of the pop. were as follow:—

Children and unmarried persons	-	18,774,696
Married	-	12,408,341
Widowed	-	2,357,870
Total	-	33,540,910

The number of marriages for the 35 years above mentioned, was 8,290,064; and the average proportion of children to each marriage 3-95, or very near 4.

If we draw an imaginary line E. and W. through France, about the parallel of 47° lat. we shall find that the 40 déps. N. of that line, with an area of 92,230 sq. m., had, in 1836, a pop. of about 18,340,000, while the 46 déps. chiefly S. of the same line, with an area of 111,565 sq. m., had a pop. of somewhat more than 15,300,000. The N. of France, therefore, with a surface 19,275 sq. m. less than the S., has 3,000,000 more inhabitants. The average pop. to the sq. m. throughout the country is estimated at 164, which is precisely the density of the dép. Jura. 37 déps. are more thickly peopled than the average, but in general only slightly so. The most densely inhabited, the small dep. of the Seine, in which Paris is situated, has 6,048 inhabitants to the sq. m., the dép. du Nord has 408, that of the Rhône 447, and that of Seine-Inferieure 302. The Bassee-Alpes, the least populous, has only 60 individuals to the sq. m.

There are about 1,800 suicides annually committed in France, which gives 1 for every 13,333 inhab. They are more frequent in the N. than in the S. In the dep. of the Seine the proportion is 1 to 3,632, in the Haute Loire only as 1 to 163,242 deaths. France has but few very large towns, but it has a great number with a pop. varying from 5,000 to 20,000. Of the total pop. 4-8ths are estimated to reside in the rural districts, and but 1-8th part in towns of more than 1,500 inhabit. (*Encyc. des Gens du Monde; Official Publications.*)

Distribution of Landed Property—Agriculture.—In France, previously to the revolution, the property of persons dying intestate was subject, in different parts of the kingdom, to different regulations; but every where estates could be disposed of by will, and settled by entail. At the revolution a nearly total change was made in these respects; the same regulations for the distribution

of property were established in all parts of the kingdom; and the power of disposing of property by will was confined within the narrowest limits. Thus it was enacted, 1. That the property of persons dying intestate shall be equally divided among their children, without respect to sex or seniority; and, 2. That, when a person possessed of property wishes to make a will, he shall be permitted, provided he have only one child, to dispose of a moiety of his property, the child inheriting the other moiety as matter of right; if the testator have two children, he is allowed to dispose of a third part of his property; and if four children, of a fourth; and so on, the rest being equally divided among the children.

This law was intended to subvert the foundations of that old feudal aristocracy, whose usurpations and oppressive privileges had entailed much misery on the country; and there can be no doubt that it was well fitted to accomplish this object. No doubt, however, this might have been attained otherwise, and without occasioning the pernicious results inseparable from this law. By interfering to so extreme an extent in the disposal of a man's property, it must plainly lessen the motives to accumulation; while, by rendering the children in a great measure independent, it weakens the parental authority, and has the same injurious operation in reference to an entire family, that the Scotch law of entail has in reference to a single child. But its worst effect consists in its inevitable tendency to reduce landed property into minute portions, incapable of being cultivated in the best manner, and in the consequent stimulus it gives to the increase of a pauper agricultural population.

That the condition of the agriculturists of France has been materially improved since the revolution, is true. But it is not true that this improvement has been in any respect owing to the law of equal inheritance. It has taken place, not in consequence, but in despite, of that law. The abolition of the game laws and feudal privileges of the nobility and clergy, and of the gabelle corvées, and other oppressive and partial burdens and imposts, was of the greatest service to proprietors and farmers; and, in addition to these advantages, a large extent of common lands was divided, and a great part of the vast possessions belonging to the church and to the emigrants came into their hands at extremely low prices, so that while small properties were generally augmented, farmers were, at the same time, in very many instances, changed into landlords. No wonder, therefore, that fresh energy was given to agricultural pursuits, and that a great improvement has been effected.

Still, however, it is certain that the rapid division of landed property, and the continually increasing excess of the agricultural population, caused by the existing law of succession, have gone far to neutralise the effects of these advantageous circumstances, and form at this moment the prominent evils in the social condition of the people of France. "The population of that country," says Mr. Birkbeck, "seems to be arranged thus: a town depends for subsistence on the lands immediately around it. The cultivators individually have not much to spare; because, as their husbandry is a sort of gardening, it requires a large country population, and has, in proportion, less superfluity of produce. Thus is formed a numerous but poor country population. The cultivator receives payment for his surplus produce in sous, and he expends only sous. The tradesman is on a par with the farmer; as they receive so they expend; and thus 50,000 persons may inhabit a district, with a town of 10,000 inhabitants in the centre of it, bartering the superfluity of the country for the arts and manufactures of the town. Poor from generation to generation, and growing continually poorer as they increase in numbers; in the country by the division and subdivision of property, in the town by the division and subdivision of trades and professions; such a people, instead of proceeding from the necessities to the comforts of life, and then to the luxuries, as is the order of things in England, are rather retrograde than progressive. There is no advancement in French society, no improvement, nor hope of it." (*Tour in France*, 4th ed. p. 34.)

In his *Tour in France*, Mr. J. P. Cobbett makes the following observations with respect to the influence of the law of equal succession in Normandy:—"I hear, on all sides, here in Normandy, great lamentations on account of the effects of this revolutionary law. They tell me, that it has dispersed thousands upon thousands of families who had been on the same spot for centuries; that it is daily operating in the same way; that it has, in a great degree, changed the state of the farm buildings; that it has caused the land to be worse cultivated; that it has caused great havoc amongst timber trees; and there are persons who do not scruple to assert, that society in France will become degraded in the extreme, unless the law be changed in this respect." (P. 168.)

The best French writers concur in the view now given of the operation of this law, and its operation in occasion-

ing the endless division and subdivision of the land, "dont l'action funeste dévore le sol de nos campagnes avec une affreuse rapidité."* But the official returns published by the French government supply the best illustration of the extreme subdivision of landed property in France. In 1818, for example, there were 10,083,731 properties, great and small, charged separately to the land tax, or *contribution foncière*. In 1848 this number had increased to 10,893,528, being an increase of no fewer than 809,777 properties in the interval! This statement does not, however, show the number of proprietors, as many of the latter hold properties in different communes, and pay taxes in each. In 1816 the number of proprietors was estimated by the Duc de Gaëte at 4,333,000; and as this estimate is believed to have been then rather under than above the mark, the number of proprietors may now be safely estimated at about 5,500,000. The greater number of these being heads of families, consisting of about 5 persons each, it follows that the proprietary class in France must comprise from 17,000,000 to 18,000,000 individuals! But exclusive of this class, the persons occupying lands as tenants, and the class of agricultural labourers, are supposed to amount together to about a sixth part of the population of the country, or to between 5,000,000 and 6,000,000 individuals. Hence, of the entire population of France, amounting to 35,500,000, about a half belongs to the class of proprietors, and about two thirds are either engaged in the business of agriculture, or depend directly on it for support. In no other European country is there such a vast body of proprietors; and, except where agriculture is the only employment, there is none where so large a portion of the population is immediately dependent on the soil.

People in England being accustomed to associate ideas of great wealth and respectability with the possession of landed property, are apt to conclude that that country where almost every second person you meet is a proprietor, must be in a peculiarly prosperous condition. But the reverse is the fact. Many of the so-called proprietors do not possess above one or two acres, and some not so much; and in most departments the majority of properties vary from 5 to 10, 30 and 40 acres. The single department of the Bouches du Rhône contains three times as many proprietors as are to be found in Scotland. The *contribution foncière*, though there are great inequalities in its pressure, amounts, at an average, to about a fifth or a sixth part of the rent of the land; and it is seen from the official returns that it is assessed as follows:—

Properties assessed at less than 5 fr. a year	5,205,411
— assessed at from 5 to 10 fr.	1,751,904
— " " " 10 — 20 —	1,514,251
— " " " 20 — 30 —	739,206
— " " " 30 — 50 —	684,165
— " " " 50 — 100 —	553,230
— " " " 100 — 300 —	341,159
— " " " 300 — 500 —	87,555
— " " " 500 — 1000 —	33,196
— " " " 1000 and upwards —	13,361
	10,893,528

Hence it appears that of the whole number of landed properties in France, nearly a half are assessed at less than 5 fr. a year; so that taking the assessment at only 1-10th part of the rent, it follows that about half the properties in France are not worth more than 50 fr., or 40s. a year! And it farther appears that of the whole properties in France amounting to 10,893,528, no fewer than 3,825,027, being about 9-10ths of the entire number, are assessed below and not above 50 fr. a year; which, on the above assumption, shows that of every 10 of the existing properties in France are worth under 500 fr., or 20L. a year! It is also seen that in the entire kingdom there are only 13,361 properties assessed at above 1,000 fr. a year, or which may be supposed to be worth more than 10,000 fr., or 400L. a year!

Such being the case, we need not be surprised to learn that though, speaking generally, the small proprietors are industrious and economical, they are, at the same time, miserably poor, and strongly attached to routine practices; and that even if they had a knowledge of improved processes, the want of capital would be an insuperable obstacle to their carrying them into practice. It is customary at this moment, in several of the southern departments, as it was 3,000 years ago, to thrash corn by treading it with horses! And in some districts the ploughs now in use are said to be the same as those described by Virgil (*Hugo, France Pittoresque, &c., art. Corvée, &c.*). Many of the small proprietors rarely taste butchers' meat; and are too happy when they find an opportunity of eking out their narrow means by working at the wages on the larger properties, if there be any such, in their vicinity. Such proprietors

are not nearly so well off as common labourers in England.

In a tract by M. Lafitte, on a proposal for reducing the interest on the public debt published a few years since, he observes:—"Si en effet le manufacturier des nos grandes villes est aussi avisé, aussi adroit que l'homme doit être aujourd'hui, notre agriculteur est aussi ignorant, aussi pauvre que dans les siècles de la féodalité; et nous avons l'indigente France du quatorzième siècle, pour consacrer les produits de l'ingénierie et riche France du dix-neuvième siècle. Une partie considérable de la population ne mange ni pain ni viande, ne se nourrit que de quelques grossiers légumes, et se couvre à peine de quelques misérables haillons!" And such is necessarily the condition of the agricultural population of every country in which the land is parcelled out into minute portions, which neither furnish sufficient employment nor subsistence to their occupiers. The latter, cut off from every hope of rising in the world, sink into a state of stupid apathy, and are destitute alike of capital, intelligence, and enterprise.

In some departments the process of division and subdivision has not been carried so far as in others; but generally if a property exceed 100 or 200 acres, and in many instances if it exceed 80, it is divided and a portion let to a tenant. Unhappily, too, the mode of letting land in France prevalent in most departments is exceedingly objectionable. Leases when granted are in general much too short; and in more than half the kingdom land is let on the *métayer* principle, the landlord usually furnishing besides the land the stock or cattle, and the seed for the first crop, and receiving as rent a certain proportion, as a third or a half (generally the latter,) of the gross produce of the farm. This system is subversive of industry and enterprise; and wherever it prevails agriculture is not stationary merely, but in the most wretched state. The following extract from an able article on the Agriculture of France, in the *Revue Trimestrielle* (No. 2. art. 1.), shows the extent and influence of this system.

"Quand les propriétaires ne cultivent pas eux-mêmes leurs terres, la mode de leur loyer est la circonstance la plus influente sur l'état de leur culture. Ce mode en France est généralement détestable. A l'exception de la Flandre, et de ce très-petit nombre de provinces où le système de la culture alourie est suivi depuis très-long-temps, la durée des baux est beaucoup trop courte, pour que le fermier ait le temps de recouvrer les dépenses que nécessite l'établissement d'une nouvelle méthode de culture, et pour retirer quelques avantages de ce changement. Enfin, dans une très-grande partie du royaume, dans toutes les provinces du centre, les fermiers sont à peine connus. Les terres sont cultivées par de malheureux *métayers*, travailleurs à moitié fruit, qui se chargent pour trois ans de tous les travaux de la culture, et qui doivent rendre au propriétaire la moitié de ses produits bruts. Le *métayer* apporte ses bras, son ignorance et son bon appétit; le propriétaire lui confie un sol épuisé, tout le mobilier indispensable à sa chétive exploitation, le grain nécessaire au premier ensemencement, et même celui qui doit le faire subsister lui et sa famille, jusqu'à la première récolte. Le *métayer* laboure, sème, moissonne, et vit là-dessus. Lui et les siens repus, le propriétaire a la reste. Quelquefois, entre le propriétaire et le *métayer*, qui est un pauvre paysan, il s'interpose sous le nom de fermier un troisième individu, le plus souvent un petit bourgeois de village, très-rusé, qui assure au premier sur le produit du travail du second un petit revenu fixe et indépendant de l'abondance et au prix des récoltes. Cet homme ne prend aucune part active aux travaux de la culture, mais il assiste à tous les dépouillements de récolte que fait le *métayer*, il le suit à tous les marchés pour s'emparer de la moitié qui lui est due de tous les produits; son habileté consiste à prendre au-delà de cette moitié sur la part du *métayer*; comme il sait lire et écrire, et qu'ordinairement le *métayer* ne le sait pas, il a beaucoup d'avantage sur lui pour embrouiller les comptes, et finalement le voler. Sous ce maître toujours présent, la condition du *métayer* est encore bien plus misérable. Ce fermier qui a généralement quelques avances, paie la rente du propriétaire avec assez de régularité; il fait de petites spéculations sur la vente de ses denrées, et quelquefois il s'enrichit. Cette combinaison est assez commode pour le propriétaire qu'elle décharge de toute surveillance, et auquel elle offre quelque garantie de paiement; mais elle est ruinieuse pour la culture parce qu'elle maintient dans une extrême misère le *métayer* qui cultiverait moins mal s'il pouvait faire quelques profits et quelques épargnes dans les années d'abondance; elle l'empêche de s'élever jamais à la condition de fermier-cultivateur; elle fait passer dans la poche de la ruine la récompense du travail."

Wherever agriculture is good or improving in France, estates and farms are comparatively large, and the latter

* For proofs of this, see M. Colloc'h's ed. of the Wealth of Nations, p. 559. 1 vol. 8vo.

† Official Accounts by the Minister of Commerce, 1857.

are uniformly let at a fixed money rent. Wherever, on the contrary, estates and farms are small, and wherever the latter are let on the *métayer* system, agriculture is either stationary or declining; and is said by Hugo and other writers to make *peu de progrès*, and to be *fort arriérée*.

We subjoin the following official statements with respect to the distribution of the soil of France; the produce of the crops, and their consumption; the average produce of the crops per hectare in different years; and the average prices of wheat in these years:—

In 1834 the surface of France is reported to have been occupied as follows:—

	Hectares.		Hectares.
Arable lands	25,559,151	Brought forward	41,611,031

Average Price of Wheat per Hectolitre through-out France	19	35	19	13	15	74	22	39	15	25					

The best wheat is said to be that of the S. and S.E. provs.; but Flanders, Picardy, Normandy, the district of Beauvais in Eure-et-Loir, Berri, Touraine, and the vicinity of the Puy-de-Dôme, furnish the greatest quantity. From 1797 to 1825, the price of wheat varied from 36 fr. 18 c. to 14 fr. 86 c. the hectolitre; for 32 of those 39 years it was under 23 fr. Rye, like wheat, is grown in almost every part of the country; but it is principally cultivated in the N.E., in Isère, and on the thin soils of Puy-de-Dôme, Creuse, Haute-Vienne, Allier, Loire, &c. The culture of maize, though it extends as far N. as the banks of the Loire, is most prevalent in the S.W., where the grain is of the best quality. Barley and oats are raised principally in the N., buckwheat on the worst arable lands of the centre and S. The potato is not yet an article of so much importance as in England or the Low Countries; but within the last twenty years its cultivation has increased very rapidly. It is mostly grown where corn is the least cultivated, as in Lozère, the Vosges, &c., and in the déps. Meurthe and Moselle in the N.E., Aube, Côte d'Or, and Eure-et-Loir in the centre, and Bouches-du-Rhône, Vaucluse, and Arles in the S. of France. The culture of beet-root for sugar, is chiefly pursued in the neighbourhood of the capital, and the déps. of the N. and E., and a part of the centre; but the arrondis. of Lille and Valenciennes in the déps. du Nord furnish one-third of the whole quantity made. It is sometimes grown on the same land for several years in succession, though, most commonly, wheat is sown alternately with it every third year, when it yields as much as if the ground had been previously fallowed. The produce of beet varies from 12,000 kilogrammes per hectare to double that quantity; in the déps. du Nord and Pas-de-Calais, from 25,000 to 80,000 kilogrammes are reckoned an average crop. At present not more than 6 or 6½ per cent. of sugar is obtained from beet-root by the processes in use, though it is said to contain a much larger quantity; the pulp serves as food for cattle. In 1828, there were 58 beet-root factories in operation, producing about 4,000,000 kilog. of sugar; but so rapid has been the subsequent increase, that, in 1835, there were 581 factories at work, requiring a supply of 668,986,763 kilog. of root, and producing

30,349,310 kilog. of raw sugar, or about a third part of the entire quantity of sugar annually consumed throughout France. (*Encycl. des Géogr. du Monde*.) In 1837, 41,000,000 kilog. of beet-root sugar were made, and the anticipated produce of 1838 was estimated at 55,000,000 kilog. But it is notwithstanding extremely doubtful whether this branch of industry will be able to maintain its ground. The beet-root sugar establishments were first introduced into France during Napoleon's anti-commercial system, when the price of colonial sugar was extravagantly high. When the restrictions on the importation of foreign sugar were removed, subsequently to the downfall of Napoleon, the establishments for the manufacture of beet-root sugar were in imminent danger of being destroyed; and to avert this contingency, the duty on foreign and colonial sugars was increased, while beet-root sugar continued to be admitted for consumption duty free. In consequence principally of this encouragement, but partly also of improvements in the manufacture, the production of beet-root sugar latterly increased, as has been stated above, with extraordinary rapidity. But as this increase, by proportionally narrowing the demand for colonial sugar, was exceedingly injurious to the colonists, the latter loudly complained of the injustice that was done them by subjecting their produce to a heavy duty while that of the beet-root growers was admitted duty free. The truth of this statement being undeniable, and it being at the same time obvious that the exemption of indigenous sugar from all duty entailed a burden on the consumers equal to the difference between the price at which it was sold and that at which foreign or colonial sugar might be bought, were it also exempted from the duty, it became necessary to adopt some measures on the subject. And after lengthened discussions, a duty of 10 fr. per 100 kilog. was laid in 1838 on indigenous sugar; and in the course of the present year (1840) this duty has been increased to 25 fr. Colonial sugar, however, still continues subject to a duty of 45 fr. per 100 kilog., but it is doubtful whether this will be sufficient to support the business; and the general opinion is, that were the duties equalized, and the people of France allowed to supply themselves with this important necessary in the cheapest market, the manufacture of sugar from beet-root would totally disappear!

Kitchen vegetables are universally grown, and are of excellent quality. In the N. and E. the wild cabbage, rape and poppy, and other oleaginous products, are extensively cultivated; the former especially in the déps. du Nord, where oil is a principal article of trade. Chicory is also raised in this part of France; trifolium is cultivated in several parts, but especially in Dordogne, where they enter into the composition of the celebrated *pâté*.

Hemp is grown in 87 déps., flax in 40; but, together with hops, they are principally confined to the N. The manufacture of tobacco is a government monopoly; its culture is restricted to the déps. du Nord, Haut and Bas Rhin, and Lot-et-Garonne. The average annual quantity of tobacco purchased by the government is about 5,733,800 kilog. A clamour has long been raised against this monopoly, but apparently without any good foundation; for, were the culture free, it would be impossible to assess the duty. The better way would be, to grub up the tobacco plantations, and to collect the

revenue by a customs duty on foreign tobacco, as is done in England.

Madder on the Rhine, woad, saffron, and some other dyes, castor oil in the S., &c., are among the other kinds of produce.

Wines.—The growth of these forms a distinctive feature in French agriculture, and would become a vast source of national wealth, were it not for oppressive duties, commercial prohibitions, and other restrictive regulations which tend to check the growth of this as well as many other branches of industry. The wines of France, while they possess body, strength, flavour, and aroma, are without a superabundance of either sugar or alcohol; and not only rival, but, generally speaking, surpass the wines of all other countries. The vine is cultivated more or less throughout the whole kingdom, to the S. of Brittany, Normandy, Artois, and Flanders; with the exception of the *départ.* Creuse, in which, owing principally to the poverty of the rural pop., it is little or not at all grown. According to the *Encyc. des Gens du Monde*, the total annual produce of wine in France may be estimated at about 38,000,000 hectol., of which 16,000,000 are absorbed by home consumption; the remaining 22,000,000 hectol. are either exported or used in the distilleries and vinegar factories. In 1827 (and it has not varied materially in the interval) the quantity of vineyard land in France was estimated at 1,736,156 hectares, equivalent to 4,265,000 English acres. The growers of wine were estimated at 1,800,000 persons; and the quantity produced at 36,945,800 hectol., or about 813,165,200 imperial gallons, worth 21,615,370*l.*, or about 6*sd.* a gallon. The cost of wine to the people of France is estimated at about 12,000,000*l.*, which supposes it to cost, at an average, each individual of the pop. about 1*s.* a year. The duties paid on the wine consumed at home amount, at an average, to 2,500,000*l.* a year. Hence of all the products of France, next to wheat, wine is incomparably the most important. The vineyards occupy, at present, more than 1-26th part of the entire surface; at the same time that the duties laid on wine amount to nearly 1-3d part of the land tax, and to 1-10th part of the entire public revenue. The average export of wine is estimated at about 1,000,000 hectol., or 22,000,000 galls. worth nearly 2,600,000*l.*

The *déps.* in which the greatest extent of land is occupied by vineyards are the Gironde, Charente-Inferieure, Hérault, Charente, Dordogne, Gers, Gard, Lot-et-Garonne, and Var; but the *déps.* of Marne, Aube, &c., forming the ancient prov. of Champagne, and those of Côte d'Or, Saône et Loire, &c., comprised in Burgundy, though yielding a less quantity of wine than many others, are highly distinguished for the superior quality of their products. Gironde, which furnishes the wines known in England by the name of *claret*, yields about 2,500,000 hectol. annually; Charente-Inferieure about 2,500,000 hectol., Charente 1,700,000 hectol., and Hérault upwards of 2,000,000 hectol. A fifth part of the Bordelais wines is used for the distillation of brandy, exported chiefly to the U. States, England, Russia, Sweden, and Denmark; but they are inferior for this purpose to those of the Charente which supply the famous Cognac brandy. For more minute details respecting the growth of the French wines, we refer to the arts devoted to the several *déps.*

Fruits, &c.—With these France is abundantly supplied. Where the culture of the vine ceases, that of apples and pears becomes of considerable importance; in the N. *déps.* orchards replace vineyards, and elder and perry are the ordinary beverages of the inhab. The elder of the *déps.* la Manche and Calvados is the best, and some of it is drunk even in the wine *déps.* The *Pays de Caux* (Seine Inférieure) is noted for its numerous and excellent apple-orchards; and the *dép.* Eure, in which almost all the roads are bordered by a double or treble range of apple trees, exports large quantities of apples to England and elsewhere. Elder is sometimes used in the distillation of brandy. Several of the central and S. *déps.* are famous for their dried pears; Aveyron, the Basses Alpes, and Indre-et-Loire for their prunes; and the Limagne (Auvergne) and the valley of Montmorency for their cherries. In the Vosges a small cherry abundance, which is extensively used in the manufacture of *kirschwasser*.

Chestnuts are very abundant in some of the central and S. *déps.*, where a portion of the rural pop. live almost entirely on them for half the year. The chestnut crops in Ardèche form a large part of its agricultural wealth. In Haute Vienne, chestnut woods occupy more than 1-14th part of the whole surface. The olive was formerly more cultivated than at present; the hard winter of 1789 destroyed many of the trees, and the climate even of the most favourably situated parts of France seems not altogether suitable for the plant. The oil of the neighbourhood of Aix, and of the *dép.* Bouches-du-Rhône, is the best. The culture of the mulberry tree, for the sake of the silk worm, is chiefly carried on in the S. In 1820, the total number of trees in the 18 *déps.* in which they were then planted, amounted to 9,631,674; and

in 1834 their number in the same 18 *déps.* had increased to 14,879,400, being an augmentation of 5,248,730, exclusive of new plantations made in no fewer than 12 additional *déps.* The increase was greatest in the *dép.* du Gard, in which, and those of Drôme, Vaucluse, and Ardèche, the rearing of silkworms is the most extensive. The quantity of silk cocoons obtained in 1835 amounted to 9,007,967 kilogr. Dr. Bowring mentions that, in 1780, a worm was imported from China, whose silk is of peculiar clearness and fineness. It is chiefly raised at Bourg, Argental, and Sorbère. Its silk is employed in the manufacture of blonde, and usually fetches about 60 fr. per lib., but has sometimes brought double that price. (*Official Tables; Statistique; St. Fargen, Aperçu; Encyc. des Gens du Monde; Berghaus; Allg. Länder und Völkerkunde*, vol. v.)

Pasturages, Cattle, &c.—The mountainous districts of France, especially the Vosges, the mountains of Ardennes, Argonne, the Côte d'Or, and the central mountain system, have extensive natural pastures; the *déps.* Ardèche and Corrèze, and the entire prov. of Limousin, form together one continuous *prairie*, subdivided by mountain ranges, and interspersed, often sparingly, with fields of buckwheat and rye. Some of the best natural pasture grounds are in the maritime districts of Normandy and Flanders, and in the Isle of Camargue at the mouth of the Rhone. It has been already remarked that artificial pastures have greatly increased of late years; the plants sown are chiefly lucerne, sainfoin, trefoil, and vetches.

At no very distant period France possessed various superior breeds of horses; but, from want of attention, many of them have deteriorated. Government, however, has lately been making active efforts to obviate this defect, by the establishment of *haras*, or studs, for the improvement of the breeds, in different parts of the country; and the expenditure for this object is about 1,500,000 fr. a year. Normandy furnishes the best carriage and cavalry horses and hunters. The horses of Brittany are the next in order: the Breton is not so handsome as the Norman horse, but it is stronger and harder. The *dép.* du Nord furnishes a good breed for farm labour, and other heavy work; those of Anjou, Maine, Touraine, &c., are also especially suitable for draught. Proceeding southward, the breeds diminish in value, till we come to Limousin, which prov., with those of Auvergne, Périgord, Guienne, and Navarre, produces the best saddle horses. The purity of their blood and their excellence increase, the nearer we approach the Spanish frontier. Alsace, and some of the other E. provs., have a large breed of horses, analogous to those of the N. In Lorraine and Champagne there is a small breed, capable of resisting fatigue for a lengthened period, if well taken care of. Asses and mules are reared chiefly in the *déps.* of the centre, the W. and S. Those of Deux-Sèvres and Vienne are the best, and many are exported to Spain. The mules used in France are bred chiefly in Auvergne and Provence.

Throughout a great part of France, and especially in the mountainous regions of the country, the ox is preferred to the horse for farm labour; and as it furnishes besides the principal supply of animal food, the rearing of horned cattle is every where pretty general. Many cows are kept along the banks of the Marne, Yonne, and Seine; in the mountains of French Comté (where they yield a great deal of milk, from which cheese similar to that of Gruyère is made); in the Forez mountains; and in Dauphiny, where also the cheese is much esteemed. Flanders, Normandy, Brittany, Alsace, Limousin, Auvergne, and the S.W. provs., are those in which the greatest number of black cattle are reared; many are sent to Artois and Picardy to be fattened in the two first-named provs. The oxen of Gascony are the largest; their weight varies from 600 to 900 lbs.; the city of Bordeaux and the navy are entirely provisioned from this species. Paris is in a great measure supplied from Anjou. The best butter is made in the N. of France, and from Brittany, Normandy, and the vicinity of Boulogne, considerable quantities, both fresh and salted, are exported. The best cheese is made in the N. of France.

According to Berghaus, the live stock of France amounts at present (1840) to 1,872,600 horses, 3,350,000 mules and asses, 6,795,400 head of black cattle, 39,000,000 sheep, 900,000 goats, and 4,500,000 hogs.

But it would appear from the estimate in the official tables that the stock of black cattle, in 1830, amounted to 9,130,600; so that if Berghaus's estimate be nearly accurate, it follows that the stock of black cattle must have decreased during the last ten years about 2,357,000 head, or about one-fourth part of the total amount! And we are inclined to think that this statement is not very wide of the mark. The truth is that France has, till lately, always been a large importer of cattle; and down to 1814 they were exempted from all duty. In that year, however, a duty of 3 fr. was laid on each head of cattle imported; and had the duty been allowed to continue at this reasonable rate it could not have been justly objected

to. But in 1832 the duty of 3 fr. was suddenly raised to 56 fr. 1 an increase which has well nigh put a stop to the importation of cattle, and been productive of many mischievous results. It is affirmed that the effect of this impolitic regulation on the price of butchers' meat has been such as to reduce its average annual consumption in Paris from 21 kilog. in 1830, to 25 kilogs. in 1836; and in the other parts of the kingdom the reduction has been still greater. If these statements approach nearly to accuracy, they will sufficiently account for the decline that has taken place in the quantity of stock, and set the pernicious influence of the high duty in the most striking point of view.

The entire slaughter of cattle in France in 1830 was estimated at 483,349 oxen, 635,662 cows, and 2,250,219 calves. Now, as many of these are not half fed, it is immediately seen how miserably small the supply of butchers' meat must be for a population of about 34 millions: indeed, a large proportion of the people of France rarely, if ever, taste butchers' meat. In Great Britain, with a pop. of about 18½ millions, or but little more than half that of France, the annual slaughter of full-grown cattle is certainly not under 1,300,000 head, or considerably more than the number slaughtered in France; and it is sufficiently established that, speaking generally, the weight of the British cattle materially exceeds that of the French. It would therefore seem that it may, perhaps, be concluded that the people of Britain consume, at an average, twice as much butchers' meat as is consumed by the people of France!

Next to corn, wine, and silk, wool is the most important article of rural produce; and, according to Berghaus, its average annual produce for the last 10 years has been 49,000,000 kilogs. It has, no doubt, become of greater value since the native breeds have been crossed with the Merino and others; but this improvement has hitherto proceeded to only a small extent, so much so, that it has been alleged that not more, perhaps, than 1-10th part of the entire stock of sheep in France experienced its effects. Most of the French wool is coarse and inferior; for the finer sorts the manufacturers are obliged to have recourse to Germany, and the value of the quantity imported into France from that country amounted in a recent year to upwards of 8,000,000 dollars. (*Berghaus*, v. 60.)

Goats are most abundant in the Pyrenean and Alpine depts. In a small district near Lyons a great number are kept in troops of perhaps 60 each, and fed in winter on vine leaves plucked after the vintage, and preserved moist for the purpose. An attempt has been made to acclimatise the Tibet goat (*Capra Egeurus*), for the sake of its wool, so valuable in the shawl manufacture; but it is not possible, owing to the greater moisture of the French climate, that the experiment can succeed. Hogs are largely reared in the N. and E.; in Alsace they furnish almost the only animal food used by the rural pop. They are numerous in most parts of France, and in the E. depts. a considerable trade is carried on in them.

Poultry of all kinds is also plentiful, especially in Maine, Normandy, Guineas are salted like pork; in the dépt. Tain there is a very large and fine species. Turkeys are also almost every where plentiful; and the *dinde aux truffes* are important articles of commerce in many parts of Dordogne and Lot. Ducks and fowls are very common: the value of the eggs exported to foreign countries. In 1835, amounted to 3,823,284 fr. The importation of French eggs into Great Britain,—that is, into London and Brighton, amounts to the enormous quantity of about 80 millions a year.

Bees are reared, especially in the depts. of Calvados, Basses Alpes, Aude, some of those on the Loire, Sarthe, and Jura. In the depts. on the Loire it is a common practice to move the hives from one district to another, which is supposed both to augment the quantity and improve the quality of the products: this process is effected in the night, and in vehicles built for the purpose. The distance travelled over at a time is often upwards of 30 m.,

and it is not unusual to see in the autumn as many as 3,000 strange bee-hives collected in a little village, where they remain for perhaps two months. (*Apereux*, 69.) The best honey is that of Narbonne; but in several depts., as those of Jura, Basses Alpes, and Calvados, the honey is but little inferior.

Fisheries.—From Dunkirk to St. Valery, the inhabs. of the coast derive a considerable part of their subsistence from the fisheries for sole, ray, turbot, mackerel, herring, &c. The sole and ray fishery lasts from about the beginning of January to that of May; the mackerel fishery then commences, and continues till about the end of July; the herring fishery, the head-quarters of which are at Dieppe, begins early in October, and ends towards the 20th of Dec. The pilchard fishery of Brittany employs, during its continuance, a large number of fishermen, besides a number of hands in curing and barreling the fish. About 8,000 barrels of salted pilchards, the produce of this fishery, are sent into the

market annually, and the inhabs. on the coast live in great part on fresh pilchards during the season. The pilchard fishery is also a branch of industry of some consequence along the coast of Charente-Inferieure and La Vendée, as that of the anchovy is on the Mediterranean coast, especially in the dépt. du Var. Great numbers of oysters are sent to Paris from Cancale Bay and the mouth of the Seine. Except those already named, the fisheries on the French coast are of comparatively trifling importance, and have only a local interest. The French cod and whale fisheries in distant seas employed in 1836—the former 406 vessels, with a united burden of 51,915 tons, and 10,172 men, and the latter 35 vessels of the burden of 14,813 tons, having 1,183 men. (*Official Tables; Hugo*, &c.)

Mining Products.—In 1834, the respective quantities, value, &c. of the principal of these are stated to have been as follows:—

	Quantities.	Value.	Mines wrought.	Hands employed.
	<i>Metr. quanties.</i>	<i>France.</i>		
Coal - - -	19,191,656		157	15,913
Lignite - - -	1,421,830	25,649,145	43	1,305
Anthracite, &c. (Addition of 1-16th for omissions)	3,556,914		25	865
Turf - - -	3,372,381	2,995,758	1,958	34,712
Iron - - -	18,041,397	4,030,561	2,162	11,500
Silver - - -	1,622	352,885	9	1,587
Lead - - -	6,303	290,980	10	912
Antimony - - -	2,925	210,220	3	461
Copper - - -	5,183	228,200	9	129
Manganese - - -	8,489	79,699	17	1,079
Alum - - -	25,715	1,033,910	1	19,517
Vitriol, &c. - - -	20,049	39,351	6	224
Salt - - -	448,218	5,991,982		
(Ditto from Spain)	3,583,072	7,696,890		
Bitumen, &c. - - -	7,419	195,477		
Granite, slate, building stone, &c. - - -		35,240,536		75,000

Mining industry in France is placed in a great degree under the control of government: for this purpose France is divided into six departments, each under an Inspector-general, which six inspectors, together with the Minister of Public Works, compose the Council-general of Mines. There is a school of Mines in Paris, and a practical miners' school at Saint Etienne. The instruction in the latter is wholly gratuitous. (*Hugo; Glog. de Saint Fargeau*.)

Manufactures.—As respects the extent and value of her products, France ranks as a manufacturing country next to Great Britain. But a great part of her progress in this department is wholly fictitious; and her natural and acquired capabilities for carrying on manufactures are very inferior to those enjoyed by this country. Speaking generally, there is a great want of capital in France, so that most establishments are conducted on a comparatively small scale: the means of internal communication, though very considerably improved, are still far inferior to what they are in Great Britain or the U. States. Coal is found in many parts of France, but the supply is notwithstanding insufficient for the wants of the country, and is comparatively dear; and iron, a cheap and abundant supply of which is so indispensable to manufacturing eminence, has mostly to be prepared by means of wood, and is much higher priced than in England. In fact, with the exception of silk and a few other branches, manufacturing industry in France is in the most unsatisfactory condition. No doubt innumerable tables and statements are put forth to show its progress; but they are all, or mostly all, fallacious. The real question is, not whether a manufacture makes a progress when all competition is prevented, and a certain extent of market provided for its products by custom-house regulations, but whether it could withstand the competition of foreigners, and increase were it exposed to an open competition? In the latter case only is it an advantage: in the former it is obviously maintained at the public expense, and its increase occasions a corresponding increase of the burdens laid upon the public, without its bringing along with it any corresponding advantage. Now we believe that a very large proportion of the French manufacturing establishments are in this last predicament.

Coal in France is obtained from between 40 and 50 different coal-fields; but of these the greater number are extremely unimportant, and those in the depts. du Nord and Loire are the only ones of any considerable magnitude, or, at all events, they are the only ones that are wrought to any considerable extent. On the whole, it appears that the entire produce of the different coal mines of France amounted, in 1836, to about 2,650,000 tons,—that is, to less than 1-12th part of the produce of the British mines, and to less, in fact, than the produce of the coal-fields in the single county of Lanark in Scotland! To suppose, after such a statement, that France can be distinguished generally in manufacturing industry, is to suppose what is all but contradictory and

absurd. Not only is coal thus deficient in quantity, but it costs more than double its price in England.

Iron-works are carried on in various parts of France, and the total produce of pig iron is supposed to amount at this moment (1839) to about 350,000 tons a year—that is, to little more than 1-4th part of the produce of the British iron-works. About 4-5ths of the fuel consist of wood; and as it is comparatively scarce and dear, the price of the iron is proportionally high. In fact, a large quantity of foreign is annually imported into France; and as iron is certainly one of the most important means and instruments for the prosecution of manufacturing industry, it might be supposed that a country anxious for the increase of the latter would admit iron duty free. But such is by no means the case: on the contrary, a high duty is imposed on the importation of foreign iron into France; and the interests of the manufacturers and of the country in general are sacrificed to that of the forest proprietors, who are apprehensive, were foreign iron largely imported, that the price of timber might be reduced. In all, about 44,000 hands are supposed to be employed in the different departments connected with the production of iron in France. The other metallic products raised in France, consisting of silver, lead, copper, manganese, &c., are of inconsiderable value and importance.

Arms are principally made at Tulle, St. Etienne, Klingenthal, &c. Bronzes of a very superior quality are principally made at Paris. The trade in cutlery, which employs a great many hands, is principally carried on at Paris, Laugres, Nogent-le-Roi, Châtelleraut, Thiers, &c. French cutlery is, speaking generally, very inferior to that of England. The ornamental jewellery trade centres chiefly in Paris; and there, and in other parts of the kingdom, about 10,000 hands are supposed to be employed in watchmaking.

The number of steam engines in use in France has greatly increased of late years. At the close of 1835 there were in all 1,418, of the aggregate power of 19,126 horses. Of these 1,112 were of French manufacture. Most of them were employed in yarn factories, mines, foundries, and beet-root sugar establishments. There were besides in the same year 100 steam-boats of the aggregate power of 3,973 horses. In 1834 there were upwards of 80 iron suspension bridges in France, though the first was erected no longer ago than 1824.

The silks of France are unrivalled among those of Europe, and are, probably, indeed, superior to any produced in any other part of the world. At the close of last century, it was ascertained by a series of accurate experiments, that French organized silk was 25 per cent superior in elasticity to the best Piedmontese, and its tenacity as 25 to 21 or 20. *Bourving's Second Report*, p. 4.) But besides this the French silks are distinguished by superior taste and elegance, and their excellence is sufficiently proved by the fact that 4-5ths of them are exported. According to the *Encyc. des Gens*, &c., the number of silk looms is now (1839) estimated at 85,000, employing 170,000 workmen, and producing silks worth 211,500,000 fr. a year. Lyons, Nîmes, Avignon, Tours, Saint Jean-du-Gard, Alais, Le Vigan, Saint Etienne, Paris, &c., are the principal seats of this important and truly national manufacture, which will be found more particularly alluded to under those separate heads. The silk manufacture of Paris have received a great augmentation of late years.

The woollen manufacture of France is also of great value and importance; and is one of those that seems well adapted to the country. The total value of the woollen fabrics annually produced in France, has been estimated, by French writers, at 420,000,000 fr.; but Berghaus reduces this estimate to 265,000,000 fr., and we have little doubt that this estimate was somewhat too high. The chief seats of the woollen manufacture are Sedan, Louviers, Elbeuf, Rouen, Bernay, Caudebec, Darnetel, Clermont l'Hérault, Lodève, Carcassonne, Châteauroux, &c.; for carpets, Paris, Aubusson, Abbeville, and Amiens.

Most of the statements that have been put forth with respect to the progress of the cotton manufacture in France since 1815, have been fallacious. That the manufacture has rapidly advanced in the interim is most true; but this advance affords no proof of its being in a really flourishing condition, or of its being suitable to France. During the latter years of the war, the difficulties in the way of importing raw cotton into France were such that its price in Havre was usually twice or three times as great as its price at Liverpool. When, therefore, the return of peace enabled the French manufacturers to obtain supplies of cotton at the same rate that was paid for it by others, and manufacture could not fall rapidly to advance, and foreign cotton goods being excluded, it necessarily went on increasing till the home demand was pretty well supplied. But beyond this limit it has not been, and, it is most probable, it will not be, advanced. The French excel in the brightness and durability of their dyes; but,

with this single exception, they are immeasurably behind us in all that is indispensable to success in this department. Their machinery is at once more expensive and less improved, as coal, which may be said to be the nerves and sinews of the business, costs double in Rouen what it costs in Manchester or Glasgow. It is idle, therefore, under these circumstances, to suppose that the French cotton manufacture can be really prosperous, or that its increase is any evidence of a proportional increase of wealth and employment. Previously to the Revolution little cotton yarn was spun by machinery; but since that epoch, or rather since the peace of 1815, machinery has been imported from England, and cotton spinning has become a principal branch of industry; and, excepting some of the highest numbers for the muslin factories of Tarare and St. Quentin, and the lace manufactures of Calais, Douai, &c., the country now supplies sufficient yarn for its own demand. The total annual value of the cotton manufactures of all kinds has been estimated by some French writers at no less than 600,000,000 fr., or 20,400,000*l.*; but there can be no doubt that this is an absurd exaggeration. The consumption of raw cotton in France does not amount to a third part of its consumption in Britain; and if we estimate the value of the cotton goods produced in the latter at 24,000,000*l.* sterling, those produced in France cannot be reckoned, on any hypothesis, at above 10,000,000*l.* or 11,000,000*l.*, and as the French are unable to produce yarn of the finest quality, and a large proportion of their imports is appropriated to the manufacture of coarse fabrics, even this is, we believe, too high.

Linen is manufactured principally in the N. provinces, and in Brittany, Maine, Dauphiny, Auvergne, &c. Scarcely there has been a very great increase in the imports of linen yarn spun by machinery from Great Britain; this has raised an outcry in France on the part of the spinners, but it has been found, that while the importation of yarn has increased, that of wove fabrics has diminished, and that consequently the weavers, as well as the public, have been benefitted by the introduction of English yarns. The best cambrics and muslins are made, the former at St. Quentin, Valenciennes, Cambrai and Solesmes; and the latter at Lyons, Alençon, &c. St. Quentin, Lille, Calais, Tarare, and Douai, are particularly noted for their *tulles* and *broderie*; but this latter branch of industry has been long in a very depressed state. Valenciennes, Lille, Dieppe, Alençon, St. Lô, and Avranches, are noted for their lace; and Caen, Bagen, Bayeux, Chantilly, and Le Puy, for their blondes. Kid gloves are made principally at Paris, Grenoble, Chaumont, Blois, Vendôme, &c. Other leather articles, as shoes and saddlery, are, of course, made in large quantities.

The French saddlery exported is worth about 2,000,000 fr. a year. The china of Sèvres, and other fine kinds of French porcelain, are much and justly esteemed. There are, in all, 12 manufactories of fine porcelain,—at Paris, Sèvres, Limoges, Toulouse, &c., producing goods to the value of from 5,000,000 to 6,000,000 fr. a year, 2-3ds, perhaps, of which are exported. Glass to the value of above 20,000,000 fr., with bricks, tiles, furniture, mineral acids, and other chemical products, glue, sail-cloth, cordage, soap, musical instruments, liquors, paper, paper-hangings, hats, &c. are important articles of manufacture.

Ships are built principally at Brest, Rochefort, Cherbourg, Toulon, Marseilles, Bayonne, Bordeaux, &c.

We subjoin a table given by Berghaus, in which he gives an estimate of the value of the manufactured articles produced in France in 1839, and an account of the principal seats of each manufacture. We do not pretend to vouch for its correctness; but the statements in it are, speaking generally, a great deal more moderate than those of the greatest number of French writers, and we appear to us to be, on this account, more deserving of credit. A tendency to exaggerate is, in fact, the besetting sin of most writers on statistics. [For Table, see the next page.]

Previously to the reign of Philip Augustus, there were very few manufactures in France, other than domestic. But about that period the linen and woollen manufactures of Laval, Lille, Cambrai, Amiens, Rheims, Arras, Beauvais, &c. began to be established. Louis XI., Charles VII., and Louis XI. endeavoured to improve the commercial resources of the nation; and in the reign of the latter monarch, the culture of the mulberry was introduced, and the manufacture of silk established at Tours. The silk manufactures of Lyons date from the reign of Francis I.; under Henri IV. several other manufactures were introduced, and many pre-existing ones improved; and under Louis XIII. new branches of industry received a rapid extension. But the grand impulse to manufactures and commerce was given in the succeeding reign. Colbert, minister of finance, under Louis XIV., invited numerous foreign artisans to settle in France, improved the great roads throughout the kingdom, excavated the canals of Languedoc and Burgundy, constructed several harbours, and gave a

ESTIMATED VALUE OF THE GOODS MANUFACTURED IN FRANCE IN 1839. (*Berghaus, Allgem. Länder und Völkerkunde, v. 87-90.*)

			Total		2,550,000,000

powerful stimulus to industry. But, notwithstanding his great merits, Colbert wanted sagacity to perceive that industry can make no really beneficial progress, except under a system of free competition; and that all attempts to bolster up manufactures are injurious to the general interests of the nation. Hence, it is not easy to decide whether the stimulus he gave to industry by the measures now alluded to, and the order and economy he introduced into the finances, was not more than counterbalanced by the regulations he established for the conduct of manufactures, and the numerous restrictions that he introduced. Colbert was, in fact, the Achilles of the mercantile system. Had he acted on the maxim, *Laissez-nous faire*, of the merchants he consulted, though his measures might not have been equally successful at the outset, they would have been incomparably more so in the end. The *prestige* that has attached to the name of Colbert has tended materially to prolong the mania for regulating in France; and consequently to enfeeble and paralyze the industry of the country.

In 1698, Marshal Vauban estimated that, of the total pop. of France, 1-10th was in a state of mendicancy, and 5 of the remaining 9ths in a condition but little above it. He at the same epoch estimated the wages of the weaver at 12 sous a day, or about 108 fr. yearly (excluding fast-lays, &c.). Arthur Young, 90 years afterwards, found that wages had risen to about 19 sous; but provisions had also increased in price. In 1827, M. Dupin estimated the average gains of an artisan in a town, and his wife, at 733 fr. a year; and in 1832, M. de Morogues estimated their united wages at 800 fr. The condition of the artisans has of late greatly improved. Rye flour, after supplanting buckwheat and oats, has in its turn been superseded, in many parts, by that of wheat; and but for the absurd regulations already alluded to in respect to the cattle trade, there can be no doubt that the consumption of butchers' meat, instead of being diminished, would have been increased. The dress of all classes has been much improved by the more general use of woollens, cottons, &c.; and in most large towns, except those of

the S.; there is now little externally to distinguish the artisans and their families from the bourgeoisie, or lesser trading families. There are considerable differences in the condition and habits of the work-people in the different manufacturing towns; but on the whole they are, both physically and morally, vastly improved.

Commerce.—Though of great extent and value, the commerce of France has not attained to the magnitude which it might have been expected to reach from her admirable situation; the great diversity and excellence of her silks, wines, brandies, and other products, and the number, enterprise, and ingenuity of her people. This depressed state of trade appears to be principally ascribable to an erroneous system of domestic economy; or to the attempt made by successive governments to render France independent of other countries, by bolstering up and protecting industry at home, and excluding foreign products. But a nation that adopts a policy of this kind, necessarily, by so doing, lays her foreign trade under the greatest difficulties. All commerce is founded on a principle of reciprocity; and those who will not buy, cannot sell. Notwithstanding, he is able to sell. The prohibitions and heavy duties imposed on many descriptions of foreign produce, proportionally lessen the demand for it in France; and by consequence lessen, in a corresponding degree, the demand for the French products that must otherwise have been exported in payment of the imports. Luckily, however, the public seems to have become to a considerable degree aware of the mischief entailed on the country by a perseverance in this anti-social system; and, despite the powerful interests engaged in its support, it has already undergone several material modifications; and there can be little doubt that, in the end, it will be replaced by a more liberal and beneficial policy.

The revolution was of signal advantage to the internal trade of France. Previously to that event, the fiscal systems and duties in many of the provinces were peculiar, and differed widely from those in others; and their frontiers were, in consequence, as vigilantly

FRANCE.

859

guarded against the free importation of the commodities of the contumacious provinces, as if they had been so many independent and hostile states! The revolution made an end of these miserable distinctions; and by subjecting the whole kingdom to the same laws and the same duties, provided for the free transport of commodities throughout its whole extent.

The great articles of which consist of silks, woollens,

and other manufactured goods, including articles of mercury and haberdashery, and of wine, brandy, jewellery, &c. The imports comprise all sorts of colonial produce, spices, dye-stuffs, &c., with cotton-wool, raw silk, timber, linen yarn, iron, coal, and an infinity of other articles.

We subjoin accounts of the import and export trade of France, during the ten years ending with 1836.

N.B. *General commerce*, as applied to imports, means all articles imported by sea or land, whether for consumption, re-exportation, or warehousing. *Special com-*

merce, as applied to imports, means such imported articles as have been entered for consumption on payment of the customs' duties. In the case of exports, *general*

commerce includes all exported articles, without regard to their origin; while *special commerce* includes those articles only that are the produce of the soil or manufactures of France.

Metrical System, Weights and Measures.—By a law of the French National Assembly in 1795, a uniform system of weights and measures was introduced, all measures being derived by the decimal multiplication or division of the *metre*, which is equal to the 10-millionth part of the distance between the equator and the pole. According to this data, the measures of length are—

The Millimetre	= 0.009 inch Eng.
Centimetre	= 0.394 do.
Decimetre	= 3.937 do.
Mètre	= 3 ft. 3.571 in.
Decamètre	= 32 ft. 9.7 in.
Hectomètre	= 100 yds. 1 ft. 1 in.
Kilomètre	= 1093.633 yds.
Myriamètre	= 10936.330 yds.

In like manner, the are (100 sq. metres, or about 1.404th part of an Eng. acre) is multiplied into the hectare (2.471 acres), &c.; the litre is cubic decimetre, and $\frac{1}{10}$ of a gallon, or a little more than a quart Eng. into the hectolitre (2.838 bushels), &c.; and the gramme (0.0005 of an av. oz.) into the kilogramme (2.205 lbs. avoird.), and other weights.

But, besides the foregoing, the ancient French measures are still in use: as the inch (equal to 1.066 Eng. in.); the foot (1 ft. 0.789 in. Eng.); aune (1.8 Eng. yds.); toise (6 ft. 4.753 in. Eng.); the league of 4,000 toises (4 miles 745 yds.); the league of 25 to the degree (2 m. 134 yds.), &c. The arep is equivalent to 0.043 Eng. acres. The French pound is equal to 0.890 lbs. avoird.; the muid = 1.124 hhd.; the boisseau = 0.320 bu. &c.

Money.—Accounts are kept in France, a silver coin worth 96d. Eng., which is divided into 10 décimes and 100 centimes. The par of exchange with England is very near 25 francs per pound sterling.

Roads, Canals, &c.—The aggregate length of the former throughout France, at the beginning of 1837, was about 52,320 m. The roads are divided into royal, departmental, and communal; their expenses being respectively defrayed by the Government, and the depts. or communes to which they belong. The royal roads have a united extent of about 21,435 m., of which about one eleventh part is paved, and the rest macadamised, or constructed in the ordinary manner. They are commonly well made, and very direct; their construction and repair, as well as those of the departmental roads, being under the superintendence of the central board of bridges and public ways, which has a head engineer established in each dep. The communal roads, which are subject to no such control, are mostly in a deplorable state, and are often impracticable for carriages. As yet no railroads of any great length have been laid down in France; the principal are those between Paris and St. Germain, and from St. Etienne to Lyons.

The entire length of the communications by means of navigable rivers and canals, was in 1837 estimated at 7,866 m., of which extent nearly five sevenths were contributed by the former. There were then 74 navigable canals complete; 16 more were in process of construction; and 14 others were projected. The principal existing are as follows:—the Canal *du Midi*, or the Languedoc Canal, which runs from Cette to Toulouse, where it joins the Garonne, and thus connects the Mediterranean with the Atlantic; the Canal of Charollais, or *du Centre*, connects the Loire with the Saône; the Canal of the Rhine and Rhone (*des Morvans*) forms a communication between these rivers by connecting the Saône with the Doubs, and the latter with the Ill, a tributary of the Rhine; the Canal of Burgundy connects the Saône with the Yonne, and consequently the Seine with the Rhone and Rhine; the Canal of Briare, and that of Orleans, unite the Loire with the Loing, a tributary of the Seine; that of St. Quentin connects the Escaut with the Oise; that of Brittany, the longest of all, being upwards of 220 m. in length, runs between Nantes and Brest. Those of Berri, Ardenne, the Ille et Rance, Nivernais, between the Loire and Yonne, d'Ourcq, which supplies Paris with water, and Somme, are the others most worthy of notice. It may be mentioned, that the royal and departmental roads are carried, exclusive of others, by 85 iron bridges over rivers and canals, all of which, excepting two in Paris, have been constructed since 1822. (*Official Tables; Hugo, Encycl. des Gens du Monde.*)

The Government, as regulated by the Charter, remodelled in 1830, is a limited monarchy, hereditary in the

male line only, with legislative bodies similar to those that exist in this country, except that the peerage in France is not hereditary, and that the peers are comparatively destitute of fortune and influence. The king is the head of the state; his person is inviolable, his ministers alone being responsible. He exercises the whole executive power; declares war, and makes peace and treaties; nominates the peers, the judges, and all other officers under the government, and participates in the legislative power with the two chambers.

The Chamber of Peers consists of the princes of the blood, and an unlimited number of members nominated for life from amongst certain specified classes of the pop., and who take precedence according to the date of their nomination. Peers may enter the chamber at 25, and have a vote at 30 years of age. The chamber has authority as a high court of justice in cases of high treason and other state offences. No peer can be arrested but by a warrant from the chamber, or is amenable to any other criminal tribunal.

The Chamber of Deputies is composed of 459 members elected by as many electoral colleges for 5 years. The qualification for a deputy is, that he be 30 years of age, and may direct taxes of the amount of 500 francs a year. Electors must be 25 years of age, and pay direct taxes to the amount of 200 francs a year. The number of electoral colleges varies in the different depts. according to their pop. The total number of electors in France, which in 1831-32 was 168,708, had increased in 1838-39 to 197,598, being about 1 in 172 of the whole pop.

A sort of system of secret voting is adopted in the election of deputies. Electors write the names of the candidates for whom they vote on slips of paper, which they throw into a box or urn. These slips being taken out, and counted by the scrutineers, the number of votes given to each candidate is ascertained, and proclaimed; the slips of paper on which the names are written being forthwith committed to the flames. The strictest secrecy is enjoined on the scrutineers, who are themselves chosen by the electors; and if they give no information, it is impossible to learn how an elector votes, should he wish to conceal it. Considering the small number of electors in France, the vast amount of patronage at the disposal of government, and the efforts that have frequently been made to prevail on them to support unpopular candidates, they have, on many occasions, manifested extraordinary independence—a result ascribable in part to the mode of their voting, but far more, we believe, to their being, speaking generally, in comfortable circumstances, or comparatively independent. The deputies receive no salary, and on accepting any salaried public employment, must resign their seats, but they may be re-elected by their previous or any other constituency.

The sittings of the Chamber are public, but provided 5 members concur in the demand, it may be turned into a secret committee, and strangers be excluded; but this privilege is rarely insisted upon, and it is said, never abused. The presence of 230 members, or half the members, *plus* one, is required to enable the chamber to deliberate. It usually assembles at from 12 to 2 o'clock, and separates at from 5 to 6. The particular clauses of a law are voted openly as in England; but the *ensemble* is voted by *ballot*; the *ayes* being indicated by white, and the *noes* by black balls, thrown into an urn. Hence it is comparatively difficult in France to predict the fate of any law as to which public opinion is divided; the deputies being able to vote according to their own sentiments with respect to it, and not being, as in England, forced to vote with their party. It is, however, difficult to say which plan is best fitted to promote the public interests. Should the Chamber be dissolved by the king, he is bound to convoke a new Chamber within three months.

The discussion upon the *ensemble* or *projet* of a law, is not carried on in the Chamber of Deputies as in the H. of C.; for the members who intend to speak in favour of and against the law, inscribe their names in a list, and being called upon by the President, or Speaker, deliver their opinions from the tribune, a place provided for them, in the order in which they are enrolled. This has led to the practice of delivering long written rhetorical harangues; which, however, are becoming unpopular. The discussion on the clauses of a law is carried on as in the H. of C.

Both chambers enjoy like privileges; either, or the sovereign, may propose a law, but custom generally concedes the initiative to the Chamber of Peers, excepting in the case of money bills, which must in France, as in England, originate with the Deputies. The budget is voted yearly. Either chamber has power to cite before it the author of any offensive publication reflecting on it, or any of its members, and to award punishment according to law. In the case of an impeachment of ministers, they are accused by the Chamber of Deputies, and judged by the Chamber of Peers.

The ministry is divided into 8 departments. The

ministers are those of justice and religion—Foreign Affairs—War, Marine and Colonies, the Interior—Commerce and Public Works—Public Instruction and Finance. The ministers are assisted by a Council of State (Conseil d'Etat), the members of which, as well as the ministers, are appointed and dismissed at the pleasure of the king.

The 86 depts. of France are subdivided into 363 arrondissements, and these again into 2,834 cantons, and 37,234 communes. Each dep. is governed by a prefect, with a salary varying from 10,000 to 40,000 fr. a year, except in the dep. Seine, where the salary of the prefect is 100,000 fr. (4,000*l.*). Each arrond. is superintended by a sub-prefect, with a salary of 4,000 fr. a year; and each commune by a mayor and other magistrates, whose services are gratuitous. The prefect is assisted by the council-general of the dep., which consists of a member from each canton, and meets once a year: a great deal of the internal administration of the dep., as the distribution of taxation, &c., is undertaken by this council. The sub-prefects and mayors are also aided by councils elected by the citizens. All the mayors are nominated by the king or the prefect; but the communes have certain rights and privileges of their own, which cannot be interfered with by the state, though the latter has perfect command over the administration of the depts. and arronds.

Justice.—The administration of justice in France, previously to the revolution, was, in the last degree, partial and corrupt. Justice, in fact, was, in the vast majority of cases, openly bought and sold; and a poor man without powerful protectors could never hope to succeed in any case. The institution of juries was unknown; and the criminal was, if possible, in a still more vicious and degraded state than the civil law. Happily, however, these things are now matter of history. The revolution swept off every vestige of the old system of jurisprudence, and of the endless and flagrant abuses that had grown up under it. The present civil and criminal law of France has been embodied in codes drawn up, under the auspices of Napoleon, with singular perspicuity and brevity; and is honestly and impartially administered.

The ordinary judicial tribunals are of 6 kinds, as follows:—Simple police courts, tribunals of justices of the peace, courts of original or primary jurisdiction (*tribunaux de première instance*), royal courts, courts of assize, and the court of cassation. The extraordinary tribunals are—citizens' benches, called *conseils des prud'hommes*, tribunals of commerce (the *cours des comptes*), courts martial, university and other special courts, and the chambers of peers and deputies. In each commune there is a police court in which the mayor presides; and in every canton there is at least one justice of the peace, appointed by the king, with power to decide in civil causes under the value of 100 francs; his decisions in those under 50 francs being without appeal. There is in each arrond. a court of original jurisdiction to decide without appeal in causes not above the value of 1,000 fr., as well as appeals from the simple police courts. These are composed of from 3 to 12 judges, appointed by the king. The number of royal courts is 27; they are established in the principal cities and towns, and have jurisdiction throughout a territory including variously from 1 to 7 depts. They are composed of a president, several vice-presidents, some legal functionaries, and from 20 to 60 counsellors; they are almost exclusively courts of appeal from the last-mentioned courts, and the tribunals of commerce. The courts of assize are temporary tribunals which take cognizance of criminal cases; one is holden at certain periods in each dep. by a jury of 12 men. The juries are composed of 12 citizens above 30 years of age; and either taxed directly to the amount of 200 fr. yearly, or belonging to certain professions. There are 5 judges, one of whom is a counsellor belonging to a royal court. The decisions of these courts are commonly without appeal; and can only be annulled by the court of cassation on the plea of informality. (*Aperçu Statist.*) The last-named tribunal is a superior court of appeal in both civil and criminal cases. It is composed of 49 members (including a first president and 3 others), appointed for life by the king. Each member must be at least 30 years of age, and have a law diploma; but no member may practise in the legal profession, or exercise any public function, but such as may be connected with his duty in the court. The court of cassation is divided into 3 separate chambers of 15 members and a president each. It may suspend the functions of any subordinate judges, and summon them before the minister of justice to answer for their decisions; and has the highest and most absolute authority in all judicial matters.

The *cour des comptes* is established to audit and examine all accounts connected with the public revenue and expenditure. It ranks immediately after the court of cassation, and is organised in a similar manner. The *conseils des prud'hommes* and tribunals of com-

merce are established in the principal manufacturing and commercial towns, being composed chiefly of commercial men. The former tribunals determine disputes between the manufacturers and the workmen employed by them; the latter decide in cases to the value of 1,000 fr., but do not themselves see their decisions enforced. (*Administration National, &c.*)

According to the reports which have been annually published since 1825, by the minister of justice, the yearly average of heavy crimes committed in France for the whole of that period has amounted to about 7,900, —1,900 against the person, and 5,800 against property. Female criminals compose about 1-5th of the whole. Crimes against the person are most common in the depts. of the centre and S. of France; their number is greatest in Corsica. Crimes against property abound most in the N.: in the dep. Seine, one occurs annually for every 1,368 of the pop. In both categories Crausé is the dep. in which there are the least crimes; those against the person being only as 1 to 37,014 of the pop., and those against the property as 1 to 20,235.

The prisons are divided into the 5 classes, of *maisons d'arrêt*, for detention during a period less than a year; *maisons de justice*, one in the dep. of each dep. for imprisonment for a longer term; central prisons, of which there are 20, containing, in 1835, 17,550 persons; bagues 3, at Brest, Rochefort, and Toulon, in which there are about 7,000 criminals, the united cost of the latter establishments being about 2,176,500 fr. a year; and *dépôts de mendicité*, of which there are 5. It is estimated that there are annually about 38,000 individuals under confinement, or the surveillance of the police. (See *Illego*, p. 83.)

Religion.—Religious toleration exists in a widely extended degree. "*Chacun*," says the Charter, "*professe sa religion avec une égale liberté, et obtient pour son culte la même protection*." Hence, we may say that the Rom. Catholic is the dominant religion in France, all that is meant is that it is the religion of the greatest number of the population. The pastors of other sects, Jewish as well as Christian, are supported by the government as well as those of the Rom. Catholic church. Since the Revolution of 1789, the influence of the Papal power has declined in France than in any other Rom. Catholic country; and not only have the Rom. Catholic clergy greatly diminished in point of numbers and influence, but several sects have latterly arisen, who, while they hold the Rom. Catholic doctrines, repudiate the authority of the Pope. Before 1789, there were in France 18 archbishops, 104 bishops, and a number of inferior clergy, amounting in all to upwards of 400,000 individuals, who among them swallowed up 118,000,000 fr. a year of revenue! There are now 14 archbishops, those of Paris, Lyons, Rouen, Sens, Rheims, Tours, Bourges, Albi, Bordeaux, Auch, Toulouse, Aix, Besançon, and Avignon; 46 bishops, and about 40,000 subordinate clergymen; and the total expense of the Rom. Cath. church, seminaries, &c., is about 34,000,000 fr. —1 fr. per head for each individual of the pop. M. de St. Fargeau, in his *Aperçu Statistique*, estimates the number of Calvinists and Lutherans at 5,000,000; but the *Encycl. des Gens du Monde* estimates the whole of the dissenters at only 2,100,000. The Lutherans, who live principally in the Rhenish and N. depts., have 228 church pastors, under the superintendence of a directorate at Strasbourg, where their chief theological seminary is situated. The Calvinists mostly inhabit the S. depts.; they have 345 pastors, and a chief seminary at Montauban. The Jews are estimated at 60,000; they are found principally in the large towns of the E. and S., and have 66 synagogues. There are some Anabaptists in the Vosges, &c., and Moravians in the dep. du Nord, but they are few.

Public Instruction.—The proportion of individuals receiving education to the whole pop. was in 1820 estimated at 1 in 27, and in 1830 at 1 in 20; it is now about 1 in 12.* At the end of 1837 the total number of schools, public and private, throughout France, was 53,921; 33,504 for boys, and 14,416 for girls. The number of pupils at the same period was 2,650,000; 1,652,847 boys, and 1,098,745 girls. Instruction is primary, secondary, or superior. To afford the first, every commune is obliged by law to support at least one primary school, either of its own, or in conjunction with neighbouring communes. In 1829, 14,230 communes were without primary schools; but in 1837 this number was reduced to 5,667: the want of schools was chiefly experienced in the S. and W. depts. Reading, writing, the French language, the first rules of arithmetic, weights and measures, the first lines of geography, and history and drawing, are the principal branches of education in these schools: they are afforded gratuitously. But besides

* Of 309,376 young men on the lists of those liable to conscription in 1835, 150,035 could read and write, 11,077 could write alone, and 25,264 were destitute of all instruction; the state of education in 8,756 could not be ascertained.

the communal schools, since 1833 infant schools have been established for the children of the poor from 7 to 10 years of age, as well as schools for adults. There were 1,886 of the latter schools in 1887, attended by 39,000 working men, and the cost of which was about 3,100*l.* a year; the instruction in them is the same as in the communal primary schools. There are normal schools for the education of primary teachers, the course of study and practice in which lasts 2 years. Secondary instruction is supplied by 330 communal colleges, 29 royal colleges, and about 1,150 private academies, under the superintendence of the university, to which they pay a fee of 5 per cent. of the sum received with each pupil. There are 26 academies for superior instruction, one in each of the cities and towns in which there is a royal court of justice, excepting Ajaccio. Each of these academies is governed by a rector, and has 2 inspectors, who visit in turn all the schools, both private and public, within their separate jurisdictions. The faculties of these academies are empowered to grant the degrees of doctor, licentiate, and bachelor. There is in Paris an *école normale*, or academy for the education of professors for the colleges throughout the kingdom, the institution of which has been of the greatest service. The whole of the foregoing establishments constitute the university of France, which is presided over by the minister of public instruction and a council of 9 members; under whose authority 12 inspectors-general visit all parts of France, to ascertain the state of education. There are some establishments, however, which are beyond the jurisdiction of the university. Such are the College of France, the Museum of Natural History, the *École des Chartes*, School of Oriental Languages, &c., the French Institute, which grants rewards for literary and scientific merit, and an abundance of societies of all kinds for the advancement of knowledge. The College of France, founded by Francis I. in 1530, enjoys a high celebrity. It is wholly devoted to the pursuit of the highest branches of art and science; none of its courses of instruction are elementary. It has 24 professors, entitled *lecteurs du roi*. The 204 public libraries in the depts. are said to contain 2,233,000 vols. (*Encyc. des Gens*, &c.): those of Paris (37 in number), in addition to the foregoing, contain 1,378,000 vols. At many of the institutions in the cap. lectures on every branch of science are delivered gratuitously by professors of acknowledged eminence.

Public Charitable and other Institutions.—It is estimated that there are about 1,850,000 indigent persons, and 75,000 absolute mendicants in France. Both classes are most numerous in the *dépt. du Nord*, where there are 160,000 individuals belonging to the former, and 8,000 to the latter. The hospitals, different asylums, and *bureaux de bienfaisance*, are the establishments chiefly serving for their relief. Their funds are partly derived from the state, and partly from their own landed or other property, endowments and donations of individuals. There were in 1833, 1,329 hospitals and asylums (*aspiques*), into which, during that year, 425,049 invalids were received at an expense of 44,842,097 fr., and 6,275 *bureaux de bienfaisance*, which gave either in-door or out-door relief to 695,932 individuals, at an expense of 8,956,036 fr. There are several lunatic asylums, a royal institution, and a royal hospital for the blind in Paris, deaf and dumb establishments at Paris and Bordeaux, maternity societies, others for the assistance of prisoners, the sick, &c., and a vast number of philanthropic societies of all kinds dispersed throughout the country.

It has been estimated that the proportion of foundlings to the total number of births is about 1 to 30. In 1834, the number of children in the foundling hospitals of France was 116,452: from that year to 1834, 336,297 more were admitted, making a total of 452,749. Of this number, 198,508 died, 78,590 were settled in life by the institutions, and 45,095 were reclaimed by their parents or others. The expenses of the foundling hospitals for the above 10 years amounted to 97,775,613 fr. *Ille-et-Vilaine* had the fewest foundlings; *Yonne* the greatest number. (*Encyc. des Gens du Monde*.) In 1833 there were 28 *monts-de-piété* (government pawnbroking establishments) throughout France. They are situated in the chief towns; some, as that at Montpellier, lend money without interest; while that of Paris received an interest of 12 per cent. on money advanced. In *Haute-Alpes* there are some similar institutions for the benefit of the agriculturists, in which the pledges received are in corn, and the interest due is paid in the same article.

The spirit of moral improvement is daily gaining strength in Paris. Insurance against the casualties of life, savings' banks, and other useful or philanthropic institutions, are all making progress, and some of them with great rapidity. According to official documents, there were, in January, 1838, 249 savings' banks in France, of which 45 had been established in the preceding year. These institutions now exist in almost

all the 86 departments. The number of depositors at the end of 1837 was 205,344, the amount of the deposits 107,000,000 francs, or 4,280,000*l.*; and we must recollect that these institutions are not yet seven years old in the country. Of the above sum, 2,040,000*l.* was in the savings' bank of Paris.

There are several institutions for mutual insurance; but one has been recently established upon a grand scale, under the title of *Banque Philantropique*, which, from its superior solidity, promises to be productive of great benefit. Its leading object is, to supply a provision for children on their reaching a certain age; but it also comprises other objects, such as insurance against the conscription. Already 12,000 families have insured in it, and the subscriptions amount to 600,000*l.* It has 1,500 agents in France, Savoy, and Belgium.

Armed Force.—According to the *Aperçu Statistique*, the total of the regular troops comprised, in 1836, 274,297 men, distributed as follows:—

	Officers.	Men.	Total.
Infantry	7,553	178,467	186,020
Cavalry	2,266	36,285	38,551
Artillery	1,142	28,297	29,439
Equipages Militaires	90	1,174	1,264
Veterans	154	6,536	6,690
Totals	11,493	247,096	258,519
Gens-d'armes	-	-	1,778
Grand Total	-	-	274,997
Horses belonging to the army	-	-	51,276

The army is recruited by an annual contingent of nearly 80,000 men, either volunteers or conscripts, above 20 years of age. The conscripts are chosen by lot for a 7 years' term of service. The exemptions from service are, natural infirmity, the being under the height of 5 ft. 1.4-5th in. (Engl.), the eldest of a family of orphans, the only son of a widow or of a father blind or 70 years of age, the brother of a soldier living or dead, and certain analogous circumstances. About 11,000 or 12,000 of those enlisted annually are volunteers. The average cost to the state of each soldier (officers and men) is estimated by Dr. Bowring at 23*l.* 16*s.* 8*d.* When not in active service, the daily pay of a captain of fusiliers is equal to 3*s.* 8*d.* to 4*s.* 6*d.*, of a lieutenant from 2*s.* 6*d.* to 2*s.* 9*d.*, of a corporal 6*d.*, and of a private 3*d.* On the march, the pay is raised at least one third, and the average of pay and rations seems to be about 5*d.* a day to the infantry soldier. Officers are far more generally promoted from the ranks than in England: and how objectionable soever in other respects, it must be admitted that conscription brings into the army a higher class of persons as common soldiers, than if it were wholly raised by voluntary enlistment. No officers or privates, however superior rank without having served 4 years in the rank immediately below. The wounded, &c. have a claim to pensions of retreat, but the pensions of a lieutenant-general, colonel, captain, and private, are respectively no more than 160*l.*, 96*l.*, 44*l.*, and 8*l.* a year, after 30 years' service, increasing 1-20th, however, each succeeding year. These pensions, together with those for widows, &c., the half-pay of all ranks, and other temporary expenses of the army, amount to 198,000*l.* a year.

France is divided into 20 military divisions; each under the command of a lieutenant-general. The grade of lieutenant-general is the highest in the French army, excepting that of the marshals, of whom there are now 11. There are 183 fortresses, citadels, forts, and other military posts, and 6 military arsenals in the country. The principal military schools are,—those of engineers and artillery at Metz, the practical military and polytechnic schools at Paris, the school of Saint-Cyr and La Flèche, and the cavalry school of Saumur. The Royal Hospital for Invalids, together with its branch at Avignon—an establishment similar to Chelsea College, instituted by Louis XIV., maintains about 5,000 old soldiers.

Independent of the foregoing regular troops, there is the National Guard. This body, which originated immediately on the taking of the Bastille in 1789, and was organised in the year following, comprises all the male pop. between the ages of 20 and 60 years, not disqualified by natural infirmities, by their professions, or by holding certain offices under the state. In 1832, the National Guard amounted to 5,739,052 men, of whom 3,781,306 were liable to active duty, and 1,947,846 formed a *corps de réserve*. Its total effective force was then estimated at about 2,000,000 men, being to the total pop. as 6 to 100. Its expense is borne jointly by the government, the departments, the communes, and the citizens themselves. The state expense is estimated at 600,000,000 fr., or about the same as the maintenance of 100,000 regular troops. The legion of honour is an order which, in a practical point of view, may be said to be military,

It has about 50,000 members of different ranks. (*Encyc. des Gens du Monde.*)

Navv.—According to an ordinance of 1st Feb. 1837, the naval force for the peace establishment consists of 40 ships of the line, 50 frigates, 180 other vessels rigged with sails, of regulated rates, and 40 steamers. One half of the ships of the line and steamers must be launched; the other half remaining on the stocks are to be forwarded to the extent of 22-24ths of preparation. The 40 steamers and the 180 sail-rigged vessels of inferior order are to be kept adrift.

The vessels adrift in 1841 are to be thus arranged, according to the budget for that year:—

Sail-rigged Vessels.	
8 ships of the line	$\left\{ \begin{array}{l} 1 \text{ of the 2d rate, of 100 guns.} \\ 2 \text{ of the 3d rate, of 90 guns.} \\ 5 \text{ of the 4th rate, } \left\{ \begin{array}{l} 1 \text{ of 80 guns.} \\ 4 \text{ of 74 guns.} \end{array} \right. \\ 2 \text{ of the 1st rate, 60 guns.} \\ 5 \text{ of the 2d rate, 52 guns.} \\ 5 \text{ of the 3d rate, 46 guns.} \end{array} \right.$
12 frigates	$\left\{ \begin{array}{l} 6 \text{ war corvettes of from 30 to 32 guns.} \\ 4 \text{ A visu corvettes of 16 guns.} \\ 12 frigates of from 16 to 20 guns.} \end{array} \right.$
6 war corvettes	$\left\{ \begin{array}{l} 6 \text{ A visu frigates of 16 guns.} \\ 7 \text{ gun brigs of 12 guns.} \\ 14 galleons, cutters, &c. of from 6 to 8 guns.} \end{array} \right.$
16 flotilla craft.	
86 war vessels.	
Vessels of Burden.	
14	$\left\{ \begin{array}{l} 10 \text{ corvettes of burden, or store ships.} \\ 4 \text{ gabarras.} \end{array} \right.$
Steamers.	
20	$\left\{ \begin{array}{l} 2 \text{ of } - \quad 450 \text{ horse power} \\ 1 \text{ of } - \quad 250 \quad - \\ 1 \text{ (the Vêloce) of } 220 \quad - \\ 2 \text{ of } - \quad 220 \quad - \\ 18 \text{ of } - \quad 160 \quad - \\ 4 \text{ of } - \quad 120 \quad - \end{array} \right.$
130	Total vessels.

There are to be added to these 130 vessels kept at sea a reserve of 21 vessels, viz., 8 disposable in roadstead, and 16 in commission in port. The composition of this reserve is to be as follows:—

Eight disposable in road:—2 ships of the line; 3 frigates; 1 war corvette; 2 brigs.

Sixteen in commission in port:—5 ships of the line, and 7 frigates; 1 vessel of inferior rate; 3 steamers.

The effective of the crews required for the 130 vessels in active service is 20,542 men, and for the reserve 1,522, making together 22,464 men.

The entire cost of the navy and naval departments, for 1841, is estimated at 71,015,900 fr.

In 1834, there were 2 admirals, 8 vice and 18 rear admirals, 228 captains, and 374 lieutenants; the pay of a vice-admiral being from 4,000 to 6,000 fr., of the captains from 1,500 to 3,000 fr., of the lieutenants 800 to 1,600 fr., and of the seamen 200 to 300 fr. a year. The coasts are divided into 5 marine prefectures, those of Cherbourg, Brest, L'Orient, Rochefort, and Toulon. The principal naval ports, proceeding N. to S., are Dunkirk, Calais, Boulogne, Havre, Cherbourg, St. Malo, Morlaix, Brest, Nantes, L'Orient, Sables d'Olonne, La Rochelle, Rochefort, Bayonne, Port-Vendres, Marseilles, Toulon, and Frejus. The minister of marine is assisted by an admiralty-council, and a board of naval works. The principal naval schools are those of Toulon and L'Orient, and that on board the *Orion* in the Brest Roads; there are, besides, 44 inferior schools.

Colonies.—These, which are under the superintendence of the minister of marine, comprise the islands of Martinique and Guadeloupe, and some smaller ones, in the Antilles; French Guiana in S. America; the regency of Algiers, Senegal, and the isl. of Gorée in Africa; the isles of Bourbon and St. Marie in the Eastern Ocean; and Pondichery, Chandernagor, Karikal, Mahé, and Yanam in Hindostan. Their united pop., exclusive of Algiers, in 1836, was 562,570, of which number 258,586 in the W. Indian and African colonies were slaves, and 165,241 in the E. Hindoos. In 1831, the slaves amounted to 294,484; the diminution in their number has been in consequence of progressive enfranchisement agreeable to a law passed in that year. The 4 principal colonies, Martinique, Guadeloupe, Bourbon, and Guiana, have each a colonial council elected by the resident French above 25 years of age, and having certain property-qualifications. In every colony there is a governor appointed by the king as his representative, who convokes or dissolves the colonial councils at pleasure, and provisionally assents to, or suspends, the execution of the decrees passed by them. The French codes of laws are in force, and justice is administered in the colonies, as in France, in tribunals of the peace, of original jurisdiction, royal courts, and courts of assize. (For further particulars, see the separate articles as above, *Hugo, &c.*)

Taxes.—The system of taxation that existed in France previously to the revolution, had every possible defect. It consisted in great part of direct taxes laid on pro-

perty, from which, however, that of the nobility and clergy, or of the richest classes, was exempted. The indirect taxes were also assessed on the most vicious principles; and the contributions of forced labour, or *corvées*, fell almost wholly on the peasantry. The collection of the taxes by farmers was also exceedingly unpopular; and, in fact, the whole system was one of partiality, preference, injustice, and oppression. The revolution made an end of these abuses, and established the sound principle, embodied in the charter, that every citizen should contribute, without distinction, to the wants of the state in proportion to his means. *Les Français contribuent indistinctement, dans la proportion de leur fortune aux charges de l'état.* But we are not sure that, practically, this principle has been carried into effect. The present land tax, or *contribution foncière*, should be assessed on all lands and houses in proportion to their nett rent; but, in point of fact, there are very great inequalities in the assessment, different departments, and different districts in the same department, being taxed much higher than others. But though the tax were equally assessed, it would be in many respects objectionable. Its obvious tendency is to discourage the outlay of capital on the land; and, besides having this effect, it is also unjust. Two estates fetch the same rent, and would, therefore, be charged with the same amount of tax; but it may happen that the one is nearly in a state of nature, while a half or two thirds of the rent of the other is really derived from the outlay of capital upon it; and, such being the case, nothing can be more unjust than to tax them both to the same extent. Variable taxes on land are, in fact, uniformly the greatest drawback on a country.

Contribution personnelle et mobilière is a mixed tax. The first part being a sort of poll tax, rated at the value of two days' labour, and charged on men of 18 years and upwards: the *mobilière* is a tax on the occupiers of houses of a certain class, charged according to the rent. The *droits des patentes*, or house duties, are charged on all persons following a trade, profession, or business. They are assessed partly according to the rent of the house occupied by the patentee, and partly according to the pop. of the town in which he carries on business. In every department in France there is an office for the registry of deeds, the fees on which, besides the expenses of the establishment, which is highly useful, yield a considerable revenue to government. The other public taxes are nearly the same in France as in England.

Besides the public taxes, *octrois* or duties are levied on all articles entering towns of any considerable magnitude, the rate of the duties varying with the pop. of the towns. These duties are great obstructions to trade and industry; but as their produce is employed to defray indispensable local charges, including the expenses of hospitals, poor-houses, &c., it will be no easy matter to get rid of them. [In the following page is inserted an account of the public revenue and expenditure for 1838.]

Public Debt.—In 1837 the charge on account of the public debt of France consisted of the following items:—

Interest on 5 per cent. stock	-	147,056,672
— 4) ditto	-	1,826,600
— 3 ditto	-	10,461,412
— 5 ditto	-	84,498,013
Sinking fund	-	44,610,468
Interest and sinking fund on loans for bridges and canals	-	9,940,000
Consolidated debt and sinking fund	-	247,649,162
Interest of <i>capitaux des cautionnements</i>	-	9,000,000
Floating debt	-	10,000,000
Annuities, or <i>déts viagère</i>	-	4,656,000
Pensions	-	60,186,130
Total	-	531,484,892

(*Aperçu Statistique*, 96.)

People, languages, &c.—It has been estimated that of the total pop., about 30,000,000 speak French, or various patois, having different degrees of analogy with that language; that 1,300,000 use German dialects, 1,100,000 the Breton, and 120,000 the Basque tongue. It is chiefly with reference to these languages that Balbi has divided the inhab. of France into four great families—the Greco-Latin or Gallic, Germanic, Celtic, and Basque; besides the Semitic, including the Jews, and some few individuals of Saracenic origin in the S. des. the Hindoo family, including the *gitanos*, or gypsies, &c. The Greco-Latin family, which comprises the great bulk of the pop. speaking dialects derived from the Latin, are probably for the most part descended from the ancient Celtic pop., by whom the country was principally inhabited at the period of the Roman conquest; and who, during the subsequent ages of Roman dominion, gradually adopted the Latin tongue, which forms the basis of the modern French. The Romans, no doubt, intermixed with the native pop., and the latter, in the S., may still have some infusion of Greek blood derived from the Greeks, who founded Marseilles, and other colonies on the Mediterranean coast; the

ACCOUNT of the Public Revenue and Expenditure, for 1838.

Revenue (1838).				Expenditure (1838).

Surplus of receipts over expenditure			16,122,028				

French are also in part the offspring of the Visigoths, Burgundians, Alani, and Franks, who successively became masters of Gaul in the middle ages. But notwithstanding that the modern French are thus descended more or less from all these races, there can, we apprehend, be little doubt that the ancient Gallic or Celtic blood predominated, especially in the central and S.W. parts. The intermixture of Roman and Greek blood could not have been very great; the Visigoths, Burgundians, Alani, and other barbarous tribes, swept over the country as conquerors, but maintained themselves in it too short a time to have any material influence on the native population, and the Franks, though, like the Normans in England, they established a martial supremacy, gave little to France but its name, and were in too small numbers to impress their own character on the nation, except perhaps in the N.E., where the population is less French than elsewhere.

Enfin les traits principaux du caractère et des mœurs servent encore à faire reconnaître cette distinction primitive des races que le progrès de la civilisation doivent un jour effacer entièrement, et qui même n'est plus guère apparent que dans les campagnes. Au sein des villes, en effet, les communications, de jour en jour plus rapides et plus fréquentes entre les diverses parties du territoire, tendent à rendre parfaitement uniformes les mœurs de la classe riche et éclairée. Aussi ces qualifications proverbialement attribuées par nos pères aux populations respectives des anciennes provinces, la naïveté champenoise, la finesse Normande, l'entêtement Breton, l'hâblerie Gasconne, &c. peuvent-elles maintenant être considérées comme sans valeur en ce qui concerne la grande partie de la population? Dans le fait, on aurait peut-être une idée plus juste des différences que présente, sous les rapports les plus généraux, la masse de la nation, si l'on partageait la contrée en trois régions, dont les limites resteraient nécessairement assez vagues. On verrait dans la région du nord des hommes de haute taille, de forte complexion, participant davantage, à mesure qu'ils se rapprochent de la frontière, de l'humour Allemand ou Belge, moins communicatifs, et un peu flegmatiques, mais frustes et hospitaliers, et qui sont en possession, par un heureux privilège, de fournir les meilleurs soldats à nos armées, et les meilleurs ouvriers à nos fabriques et à nos champs. Dans la région du midi, on trouverait des hommes généralement plus petits, plus agiles, et plus actifs, prompts dans toutes leurs résolutions, portés à une gaieté insouciance, et chez lesquels l'esprit supplée à la société qui distingue les habitants du nord. Au centre serait une population intermédiaire entre les deux autres, et qui leur est beaucoup inférieure. Là surtout, en effet, se trouve le paysan ignorant et apathique, ennemi de l'in-

novation, vivant de peu, et qui semblerait destiné à rester éternellement stationnaire, s'il n'avait sous les yeux l'exemple de ses frères des autres régions. En dehors de la classification que nous essayons de tracer doivent rester les populations montagnardes et maritimes, qui présentent partout des traits presque identiques, bien connus.

"Dans l'ensemble, le caractère national, formé du mélange des qualités et des défauts qui prédominent dans les portions principales de la population, se distingue spécialement par une vivacité, par une fougue, portée en tout, et dont le correctif nécessaire est la mobilité. C'est, en effet, parcequ'on a pris des résolutions irréflexibles et précipitées qu'on en change brusquement. Le courage, la loyauté, le désintéressement, sont encore des qualités qu'on ne refuse guère à cette nation, essentiellement sociale, et qui, à sans contredit, le plus contribué à imprimer à la civilisation Européenne son élan actuel." (*Encyc. des Grands du Monde*, xi. 503, 504.)

Generally speaking, the French people, particularly those who have the greatest admixture of Celtic blood, are inferior in size to the English. In our army, 5 ft. 6 in. is the minimum size for recruits; but in the French army, the size is fixed at 5 ft. 10 in. English measure. One, in fact, is struck with surprise at the diminutive size of the soldiers in an ordinary French regiment; and this fact, and not any supposed want of bravery or resolution, sufficiently explains the fact of their little success in close fight with English troops.

It would be useless to enter into any lengthened details with respect to the language and literature of France. The former, though wanting in energy, possesses great clearness and precision, and is the favourite language of diplomatists and courtiers. It is not going too far to say, that the French have attained to high excellence in almost every branch of art, science, and literature; and though in some departments they may have to yield the palm to others, their literature is, probably, on the whole, the richest and most valuable of which any modern nation has to boast. The French writers are particularly distinguished by extreme perspicuity, good sense, an attachment to classical models, and, perhaps, also, by a deficiency of sentiment. Latterly, however, the public taste has apparently undergone some considerable modifications; and the literature and philosophy of their German neighbours appear to be materially influencing their tastes and pursuits. We doubt, however, whether this be any improvement. The depth and sentiment of the Germans are more apparent than real: the use of an ambiguous phraseology, and the want of clear and distinct ideas, often give an appearance of depth where there is really none. And Pater has been a less admirable writer, the probability is that he would have been considered a

more profound thinker. And so, probably, it will be with the French: should they ever become as transcendental and unintelligible as the Germans, they will be supposed, by that very large class who admire most what they least understand, to have attained to a depth and capacity of thinking, to which Descartes and Malebranche were strangers.

History.—Before the time of Cæsar, the whole of this country was known to the Romans by the name of Transalpine Gaul; but after its conquest, it was divided into the four provinces of *Provincia Romanorum* (Provence), and *Gallia Aquitania, Celtica, and Belgica*. In the 5th century it was subdivided into 17 provinces, inclusive of all the territory on the E. bank of the Rhine. At the latter epoch the Germanic nations began to pour in an irresistible torrent over Gaul. The Visigoths established themselves in the W. and S., from the Loire to the Pyrenees, where they established a kingdom that lasted till about 540. The Burgundians, in a similar manner, settled in the E., from the Lake of Geneva to the Rhine, and afterwards stretched along the Rhone to the Mediterranean; the independent sovereignty they erected lasted till about 532. The Franks, whose dominion swallowed up those of both the foregoing tribes, had been long settled in the N.; and Pharamond, their chief, in 420, is considered the founder of the French monarchy, as he was of the first or Merovingian race of Frankish kings. In 486 Clovis defeated Syagrius, the Roman general, at Soissons, and finally extinguished the Roman power in the W. and in 507, by his victory over the Visigoths, he rendered himself master of all the country between the Loire and the Garonne. On the death of Clovis, in 511, his dominions were divided into four kingdoms, those of Paris, Metz, Soissons, and Orleans, each governed by one of his four sons; these, however, were re-unioned in 558. In 732, Charles Martel defeated the Saracens, who had effected the conquest of a great part of the S. of France, in a great battle; and ultimately succeeded in expelling them from the kingdoms. In 751 the Carolingian dynasty commenced in the person of Pepin le Bref, son of Charles Martel, and was carried to the summit of its power by Charlemagne, the son of Pepin.

Under the first race of kings the country was a prey to bloodshed, spoliation, and anarchy: industry and commerce were almost unknown, or extended only to the production and barter of a few indispensable articles. Nor was this condition much ameliorated during the rule of the succeeding race. Charlemagne, indeed, encouraged trade and manufactures in the towns, which before his reign were chiefly confined to the cloister, or practised by isolated individuals; but after his death, things returned to their original state of confusion. Under his immediate successor, France was again divided into four parts; and the Normans began to ravage its N. provinces; the power of the nobility also rapidly increased; and the last sovereign of the Carolingian dynasty, Louis V., in 986-7, possessed only the town of Laon! His successor, Hugh Capet, count of Paris and Orleans, the founder of the third race of kings, governed only the Ile-de-France, Picardy, and the Orléanais. The dukes of Normandy, Brittany, Aquitaine, Gascony, Lorraine, and Burgundy, the counts of Flanders, Champagne, Vermandois, Toulouse, and several minor seigneurs, shared among them the rest of the modern kingdom. By degrees, however, all the great fiefs fell in various ways to the crown. Vermandois was united to it by Philip Augustus; Touraine and Perche by Louis IX.; Champagne in 1274; the Lyonnais, Dauphiny, and Languedoc, in the 14th century; Berry, Normandy, Gascony, Burgundy, Anjou, Maine, and Provence, in the 15th; the Bourbonnais, Auvergne, Brittany, Lorraine, and considerable territories in the N. of France, in 1618; and Flanders, Artois, Franche-Comté and Alsace, in the 17th century. The names of the sovereigns of France, beginning with Hugh Capet, and the dates of their accession, are as follows:—

967 Hugh Capet.	1560 Charles IX.
996 Robert (le Sage)	1574 Henry III.
1031 Henry I.	1589 Henry IV. (le Grand).
1060 Philip I.	1610 Louis XIII.
1108 Louis VII. (le Gros).	1643 Louis XIV. (le Grand).
1137 Louis VII. (le Jeune).	1715 Louis XV.
1180 Philip Augustus.	1774 Louis XVI.
1225 Louis VIII. (le Lion).	1793 Louis XV. supplanted and the Republic established.
1286 Louis IX. (St. Louis).	1795 Consul appointed.
1370 Philip III. (le Hardi).	1804 Napoleon raised to the throne with the title of Emperor.
1385 Philip IV. (le Bel).	
1314 Louis X. (le Hutin).	
1316 John I.	
1316 Philip V. (le Long).	
1328 Charles IV. (le Bel).	
1328 Philip VI. (le Fort).	
1350 John II. (le Bon).	
1364 Charles V. (le Sage).	
1380 Charles VI. (le Folle).	
1422 Charles VII.	
1441 Louis XI.	
1483 Charles VIII.	
1498 Louis XII. (le Père du Peuple).	
1515 Francis I.	
1547 Henry II.	
1569 Francis II.	

While the monarchy gained in consistency and extent, the royal power was making constant advances. The political rights and privileges which the nobles exercised under the feudal system were the objects of continued attacks on the part of the crown; which, though sometimes defeated, were, in most instances, successful. At length, under the administration of Richelieu, the nobles were stripped of all power; and there being no other body in the state, with the exception of the parliaments, which had degenerated into little else than courts of law, that enjoyed any constitutional privileges, the power of the crown was raised above control. Under the vigorous, and, for a lengthened period, prosperous government of Louis XIV., the royal prerogative arrived at a maximum. But the close of this reign was eminently unprosperous; and the wars in which Louis had been long engaged, the burdens they obliged him to impose on his subjects, and the vast debts he had contracted, produced not only great suffering and misery, but also great discontent. During the reign and the subsequent part of the reign of Louis XV., abuses of all sorts multiplied on all hands, and were no longer concealed by the dazzling splendour and magnificence of the preceding period; the most worthless parasites obtained a predominating influence at court; the command of fleets and armies was entrusted to the merest imbeciles; the finances were involved in the greatest disorder; and France and Europe were scandalised and disgusted by the gross sensuality and vulgar profligacy of the king and his intimate associates. Louis XVI., who ascended the throne in 1774, was actuated by the best intentions, but he wanted the firmness of purpose and capacity required to so desperate a crisis. The abuses that infected the whole frame of society, though destructive of the public interests, were either really advantageous, or believed to be so, to a vast number of persons, including the nobility and clergy; and it would have required a mind of a very different order from that of Louis to have frustrated the solicitations, intrigues, and cabals of such powerful parties, and to have safely carried through the reforms that had become indispensable. At length, after a variety of futile expedients had been in vain resorted to, it was resolved, in 1789, to hold a meeting of the States-General, which had not been convoked since 1614, for effecting the necessary changes, and averting a public bankruptcy. This was the commencement of that tremendous revolution which cost Louis his life, and destroyed every vestige of the government and institutions that existed when it broke out.

The atrocities connected with the Revolution have been supposed to cast a dark overshadow over the French character; but we are not inclined to regard them in this point of view. They were the wild, but not unnatural, excesses of an untruncated populace, that had suddenly been emancipated from a state of extreme degradation, and which had innumerable grievances to suppress, and wrongs to avenge. It unfortunately happened, that when the nobles were stripped of all political power, and rendered incapable of opposing any effectual resistance to the sovereign, they were, at the same time, left in full possession of their feudal privileges as landholders. These comprised an exemption from those taxes that fell with their full severity on every one else; the dispensation of justice in manorial courts; and a host of vexatious privileges connected with the game laws, the laws respecting mills, &c. The rental of very many estates consisted, previously to the Revolution, of little else than services and feudal tenures, by the baleful influence of which the industry of the occupiers was almost exterminated. The country population was every where, in fact, in a situation of predial slavery; and while the nobility and clergy threw the burden of the *taille*, *corvée*, and other oppressive imposts, wholly on the *peasants*, they engrossed to themselves every situation of power and emolument; so that, down to the Revolution, no individual, how meritorious soever, unless he obtained a patent of nobility, could be made an officer of the army, or be promoted to almost any public employment. Government deprived the nobility and landed aristocracy of all that could have rendered them useful, at the same time that it left them all that could render them little tyrants, and a curse to the country in which they lived. If we add to these grievances the fact, that the peasantry received no efficient protection from the government, and that the administration of justice in the king's courts was, speaking generally, partial, venal, and infamous, we shall be at no loss to understand why the aristocracy was so universally detested in France, and why the Revolution, which was indispensable, was so sweeping, bloody, and destructive.

The proscriptions and anarchy by which the Revolution was accompanied continued till Napoleon assumed the supreme direction of affairs. The talents of this extraordinary man were, however, not only his ambition, which, by overstepping all bounds, precipitated him into enterprises that ultimately led to his overthrow. In 1814 the family of Bourbon was again

replaced on the throne; but the elder branch had profited as little as the Stuarts in England, under similar circumstances, by the lessons of adversity, and in 1830 they were re-expelled from the kingdom. The crown was then offered, under certain conditions, to his present Majesty Louis Philippe, previously Duke of Orleans, who has since occupied the throne, and preserved, by his firmness and good sense, the peace of France and of Europe.

Probable continuance of the existing order of things in France.—It would be to no purpose to take up the reader's time by making any observations on the great influence exercised by France in the politics of Europe and the world. That is too obvious, and has been too strikingly exemplified during the last half century, to require being pointed out. But, since the overthrow of Napoleon, France has been rather an object of awe, and of vague apprehension, from a want of confidence in the stability of her existing institutions, than from any fear of what she might be able to effect under a constitutional and settled form of government. Under all the circumstances, this feeling is, perhaps, not very unreasonable; for, were any thing to occur to subvert the present order of things, and to excite the popular enthusiasm, it is difficult to say what the result might be. There are, indeed, many persons who are inclined to regard all apprehensions as to the subversion of the present constitution in France as chimerical; we confess, however, that we are unable to participate in their confidence. Everything in France appears to be tending to a pure democracy; and were there nothing else, the law of equal succession, by preventing the continuance of large fortunes in single families, would suffice to bring it about. What, in fact, is there in France to oppose a revolution? With the exception of the holders of funded property, and of those in the immediate employment of the court, hardly any one could apprehend any injury from it; and it is most probable that the property of the former would be protected. There are no longer any great landholders, and it is immaterial to the holder of a small patch of land who is at the head of affairs, provided the burdens laid on him be not increased. Monarchy in France is without all those old associations and powerful bulwarks whence it derives almost all its support in this, and most other countries; and there is really nothing to hinder a hostile majority in the Chamber of Deputies, or any thing that should powerfully influence the public mind, from at once subverting the regal branch of the constitution. The peers have no real power; and there is no class that has that deep and abiding interest in the support of the existing institutions, that seems indispensable to rescue a government from sudden popular impulses, and give it security and free action. Napoleon will, most probably, be found to have correctly appreciated the existing state of things when he declared, that "the destruction of the aristocracy had proved fatal to all subsequent efforts for establishing a constitutional monarchy in France; the Revolution had attempted the solution of a problem as impossible as the direction of balloons. An aristocracy is the true support of the throne; its moderator, its lever, its fulcrum. The state without it is a vessel without a rudder; a balloon in the air." (*Las Cases*, iii. 23.) Great prudence and caution on the part of those in authority may, no doubt, enable a government like that of France to exist for an indefinite period, but still it must be deemed to be of the most precarious character. At present, the members of the electoral colleges constitute the only aristocratical body to be found in the country; and there is, perhaps, little to fear from the encroachments of power on the one hand, or of licentiousness on the other, so long as the confidence on their present footing. But great efforts are being made to lower the qualifications of electors, and, consequently, to extend the electoral basis; and should these be successful, the government will necessarily be rendered still more dependent on popular impulse.

But though monarchy should be subverted in France, we look upon it as the merest possible delusion to imagine that there can be any thing like a repetition of the enormities and outrages that accompanied the revolution of 1789. Society is now arranged on a totally new basis; there are few or no abuses to rectify; its moderator, not suffering from the oppressions of a host of feudal tyrants; and, though that be more doubtful, it may be supposed that they have had sufficient experience of the folly of attempting to conquer the world. Provided, therefore, they be left to arrange their internal affairs as they may judge best, we incline to think that the other European nations have little to fear from any changes that may take place in the form of government in France. At present, it is a democracy with an hereditary head; the only change likely to happen, is to a democracy with an elective head.

FRANKFORT or FRANKFURT-ON-THE-MAYN. a celebrated commercial city of W. Germany, cap. of the republic of same name, and seat of the diet of the Germanic confederation, on the N. bank of the Mayn, 18 m. N.E. by

R. from its confluence with the Rhine at Mayence, 49 m. S.E. Coblenz, 66 m. S.S.W. Cassel, and 17 m. N. by W. Darmstadt; lat. 50° 7' 29" N., long. 8° 36' E. Pop. (1838), together with its suburb Sachsenhausen, 54,822. It is oval-shaped, and communicates with Sachsenhausen on the opposite bank of the river, by a stone bridge, of 14 arches, being about 900 ft. long, by 11 broad. Its fortifications were demolished by the French, and their site is now occupied by public walks and gardens. The city is, however, still entered by 9 principal gateways, 3 of which are in Sachsenhausen; and some of them are remarkable for their elegant and classic style of architecture.

Frankfort presents many different varieties of aspect. The old town, with its narrow streets and quaint wooden buildings, with gables overhanging their basement stories, has an unprepossessing appearance, and the Jews' quarter is filthy. In the new town, however, the Zell, the new Mayence-street, Allee, and especially the fine quay which stretches along the Mayn nearly the whole length of the city, are beautiful streets and promenades, and not a few of the houses in them are literally palaces. The streets are generally well paved, and lighted with gas. There are some good squares, several, as the Ross-market (Horse-market), being ornamented with fountains and avenues of trees. Frankfort possesses several interesting public buildings. The Römer, or council-house, is of uncertain origin, but was most probably built by the Frankish emperor; it possesses no architectural beauty, but is deserving of notice, as being the place where the emperors of Germany were elected. The election chamber, on the ground floor, now serves for the sittings of the senate of Frankfort. Above this apartment is the *Kaisersaal* (imperial saloon), "a large dreary chamber, with a gloomy-vaulted roof," but once the scene of the splendid pageant of the election banquet, at which the emperor was waited on at table by the high officials of the empire. Its walls are surrounded by niches, in which are placed the portraits of the German emperors in the order of their succession, from Conrad I. to Francis II.; the latter, with whom the line of the emperors of Germany ceased, filling up the last vacant space. In this building is preserved the famous "Golden Bull," the deed by which Charles IV., in 1356, settled the mode of election of the German emperors, fixed the number of electors at seven, and determined their rights of voting. The present diet of the German confederation assembles in the former palace of the prince of Tours and Taxis, now the residence of the Austrian ambassador; a structure of the last century, containing 140 different apartments, and richly furnished. The cathedral, or church of St. Bartholomew, is an edifice of Gothic architecture, in the form of a cross, 246 German ft. long, by 216 broad. It is said to have been begun, in the time of the Carolingian princes: the greater part of it is, however, the work of the 13th and 14th centuries: the tower, which is 360 ft. in height, is still unfinished. This church has not much beauty; but it contains some curious monuments, especially that of the emperor Gunthar of Schwarzburg, killed by the rival, Charles IV.; a fine painting of the Assumption by Rubens, and a *Trinity* by Brendel; and the chapel in which the German emperors were crowned. There are 14 other places of worship, including 6 Lutheran, 1 Calvinist, 1 French-Protestant, and 4 R. Cath. churches, besides 2 synagogues, one of which is a very handsome building. In the church of St. Catherine, there is a fine painting of "Jesus on the Mount of Olives," by Boss. The church of St. Leonard, near the river, occupies the site of a palace built by Charlemagne, but of which no traces exist. The *Saalgar*, a building of the last century, also near the Mayn, is erected on the site of another, built by Louis the son of Charlemagne, and which afterwards became the residence of the Carolingian emperors of Germany. The modern edifice includes within it the chapel of the original one, which is probably the most ancient structure in Frankfort. The ancient palace of the Knights of the Teutonic Order, in Sachsenhausen, is in a state of decay, and now serves as a barrack for Austrian troops, who, in conjunction with Prussians, at present garrison Frankfort. The Haus zum Braumfels, or exchange, is a small neat quadrangle, surrounded by a range of warehouses and shops, thronged during the fair with merchants of all nations. The Stidel Museum and Academy of Painting (so named after its founder, a rich banker and citizen, who in 1816 bequeathed a million of florins, together with a respectable collection of pictures and engravings, for its foundation), occupies a handsome new building in Mayence-street. The gallery, without being first-rate, possesses several good specimens of art, chiefly of the Flemish and Dutch masters. Private collections of pictures are very numerous; and "there is scarcely a merchant or banker in Frankfort, of moderate affluence, who has not his little gallery, which, with his music, his calèche, and his pipe, forms his favourite recreation from the fatigue of business." (*Autumn near the Rhine*, p. 91.) The principal work in the fine arts

FRANKFORT-ON-THE-MAYN.

at Frankfort is, however, Danneker's celebrated statue of "Ariadne seated on a Tiger" in the garden of Mr. Bethmann. Most travellers rank this piece of sculpture among the most distinguished productions of modern art; but it unfortunately happens that the marble in which it is executed is covered with blue veins and spots. Danneker had this work in hand for 15 years, and received for it 15,000 florins. One of the most interesting public monuments is without the Friedberg-gate; it is a colossal mass of granite rocks grouped together, on one of which are inscribed the names of the Prince of Hesse Philipsthal and the Hessians, who fell on the spot defending Frankfort, the whole surmounted by a military device cast from cannon taken from the French, and surrounded by weeping willows. This memorial was erected by the King of Prussia. The Senkenberg Museum of Natural History, and Medical Institute, occupy an imposing building of the 14th century; the museum contains many rare specimens brought by the traveller Rüppell from N.E. Africa. The public library, with 80,000 vols.; 5 hospitals, the orphan asylum, lunatic asylum, theatre, with an illuminated clock over the stage, the casino, or principal reading club, and the new cemetery near the city, containing several works by Thorwaldsen, are the remaining objects most worthy of notice. The hotels in Frankfort are amongst its most magnificent edifices, and certainly rank among the first in Germany for elegance, accommodation, and moderate charges. Many of these are situated in the Zell, and in some, during the fairs, 150 people daily dine together.

The chief manufactures are carpets, table-covers, oil-cloth, woollen, cotton, and silk stuffs, woollen yarn, coloured paper, tobacco, playing-cards, gold and silver articles, and printers' black. Cannabich says there are 14 printing offices, besides several stereotype and lithographic establishments. But the principal sources of wealth to the merchants of Frankfort are commercial transactions, banking, and speculations in the funds. The inhab. of Sachsenhausen are mostly peasantry of Saxon descent, and distinguished from the rest of their fellow citizens in manners, customs, dress, and language, as well as occupations. They are generally employed in garden cultivation, fishing, &c., or as porters. Frankfort is one of the four great emporiums for the supply of Germany with all kinds of merchandise, and enjoys therefore a considerable proportion of transit and commission business. Its merchants commence business at 6 or 7 in the morning, and till 10 or 11 at night, "not having, as yet, attained to that methodical celerity, which in London despatches a hundred times the amount of affairs between the commodious hours of 9 and 6." Two large and celebrated fairs, at Easter and Michaelmas, are annually held in this city. These suffered materially during the occupation of the country by the French; and since the peace they have been affected by the improved communications established in all parts of the country, the greater diffusion of shops and magazines in all the principal towns, and, in short, by the concurrence of all those causes that tend, as civilisation advances, to lessen the importance of fairs. "In the Braunfels, which is set apart exclusively for the accommodation of merchants attending at the fairs, and arranged for that purpose, a large portion of the stalls were unoccupied at the last fair; and those who attended hardly sold goods sufficient to cover the expense incurred." (*Boyring's Report on the German Customs Union*, p. 26.) Generally, however, a large amount of business is still transacted at the Frankfort fairs. Cotton twist and stuffs, cutlery, &c., are the British commodities best suited for them. This city is now included in the German customs' league.

The town and country civil and criminal tribunals, court of appeal, board of taxation, and most of the administrative establishments of the republic, are held in the city. There are a great many educational institutions, including a gymnasium; the medical Institute, with 6 botanic gardens; Normal Jewish, drawing, deaf and dumb, and trades' schools, and numerous private seminaries; many learned and benevolent associations, as the Senkenberg society, the society for the encouragement of useful arts, and philosophical, Bible, and missionary societies. Few towns abound so largely with public charities. Some periodical publications are issued; but those of a political character, being subject to a censorship, are of little value. The authorities have evinced great illiberality in their treatment of the Jews, and even of some Christian sects.

Frankfort is one of the most ancient cities in Germany. Charlemagne held a council in it 794, and it was fortified by Louis-le-Débonnaire in 838. In 843, it became the cap. of the kingdom of Austrasia, and not long afterwards, under Louis the German, its great fairs originated, and Frankfort became the commercial cap. of Germany. From this period the increase of its prosperity was rapid, and in 1184 it was made an independent free city. It acquired considerable privileges during the next two centuries; and in 1390 had obtained nearly its present

FRANKFORT (REPUBLIC OF). 867

extent of territory. From 1806 to 1810 it was the cap. of a prince-principality, and from the latter year till the downfall of Napoleon it was the cap. of the grand duchy of Frankfort, which comprised a territory of nearly 3,000 sq. m. It was the native place of Goethe, born here in 1749, as well as of the family of the Rothschilds, one of whom has an elegant villa without the city. (*Berghaus*, iv. 483-486; *Cannabich*, pp. 461, 462; *Möller*; *Autumn near the Rhine*, pp. 67-98; *Dict. Géog.*; *Murray's Hand-book*, &c.)

FRANKFORT-ON-THE-ODER, a town of the Prussian dominions, prov. Brandenburg, cap. government of (Regierungsbezirk) of same name, circ. Lubus, on the Oder, about 116 ft. above the level of the Baltic, 50 miles E. by S. Berlin; lat. 52° 23' 9" N., long. 14° 23' 15" E. Pop. 23,370. (*Berghaus*.) Though no longer a fortress of any strength, it is surrounded by walls, with towers and a ditch. It is well built: the streets are straight and broad; the houses generally good; and many of the public edifices handsome. The town communicates with one of its three suburbs by a wooden bridge across the Oder. It has a good market-place, six Protestant churches, a Roman catholic chapel, synagogue, government-house, council-house, market-place, gymnasium, high school, school of midwifery, school for neglected children, and various other schools; an orphan asylum, two hospitals, a work-house, with a house of correction, and a theatre. A university established in it, in 1506, was, in 1810, removed to Breslau. It is the seat of the authorities for its government and circle, of a superior judicial tribunal for the former, and inferior courts for the latter and the town, a circle council, council of nobility (*Ritterschafts-Direction*), and boards of taxation, agriculture, canals, waterworks, &c. Being situated on the high road from Berlin to Silesia, and on a navigable river communicating by canals, with the Vistula and the Elbe, it has a considerable trade; though, in commercial activity, it is far inferior to its namesake of the Mayn. It has manufactures of woollen and silk fabrics, stockings, gloves, leather, earthenware, wax, sugar, &c.; with brandy distilleries, and mustard-works, for which article it is celebrated. A good deal of wine is grown in its vicinity. Three large fairs are held here annually, in Feb., July, and Nov. The fairs are attended by great numbers of merchants and dealers from foreign countries, as well as from Germany. Besides the woollens, linens, earthenware, silks, and other articles furnished by the town and its vicinity, and the various raw and manufactured products of the Prussian and other German states, very large quantities of British, French, Swiss, and other foreign goods, are disposed of at these fairs, partly for the supply of the surrounding country, but principally, perhaps, for exportation to Poland, Galicia, Russia, Bohemia, &c. Many of the inhab. are employed in navigating the Oder, and the communicating streams, as canals to Danzig, and the communicating rivers, as the Vistula, the Oder, the Elbe, the Oder, the Oder, &c. The village of Kunnersdorf, in the vicinity of this town, has been the scene of one of the most sanguinary contests in modern times. On the 12th of August, 1759, Frederick the Great attacked the entrenchments of the Austrians and Russians at that place; but after partially succeeding, and exhausting all the resources of skill and valour, he was compelled to retreat with immense loss; the approach of night having alone saved his army from being completely destroyed. (*Zedlitz, Der Preussische Staat*, ii. 205-211; *Berghaus*; *Cannabich*, &c.)

FRANKFORT (REPUBLIC OF), an independent state of W. Germany, and the smallest in Europe, though the most populous relatively to its extent; consisting of the city of Frankfort on the Mayn, and the country immediately around it, together with some detached portions of territory, the whole having an area of about 55 sq. m., and a pop. (1836) of 63,986; of whom about 3-4ths are Lutherans. The largest portion of territory belonging to Frankfort, being that in which the cap. is situated, lies on both sides the Mayn, having N.W. and N. the dom. of Nassau and Hesse Cassel; and S.E. and S. those of Hesse Darmstadt. It is quite level, and very productive and well cultivated, yielding corn, potatoes, pulse, fruit, and wine, and feeding many cattle. Much of it is, however, laid out in gardens; the environs of the city of Frankfort being completely studded with the country houses of merchants and others. The government is vested in a senate, a permanent chamber of citizens, and a legislative chamber. The senate, which exercises the executive power, consists of 48 members, divided into 3 ranks or benches; sheriff, junior senators, and state councillors. It annually chooses 3 presidents from the first and second ranks. The permanent chamber is an assembly of 51 members, chosen from among citizens of all ranks, and of whom at least 6 must be lawyers. The legislative chamber is composed of 20 senators, 30 members of the permanent chamber, 45 members chosen annually by the electoral college of Frankfort, and 9 deputies from the rural districts. This body meets every year in November for a session of 8

weeks. It has control over all legislative enactments, the amount of taxation, and the armed force, foreign relations, &c. Citizenship is a personal distinction, not obtained by birth alone; neither domestic servants nor foreigners enjoy the rights of citizens; and foreigners have to pay for permission to exercise any calling in the city. Appeal lies from the ordinary civil and criminal tribunals in the city to the senate, and from the latter to the superior court, for all the Hanse towns in Lubeck. Public education is well attended to, and there are many charitable institutions. The contingent furnished by Frankfort to the army of the German confederation is 475 men. The *landwehr*, or militia, comprises all the male pop. between the ages of 19 and 60. The public revenue varies from 430,000 to 460,000 rixdollars a year; the expenditure is less. The public debt exceeds 5,000,000 rixdollars. Frankfort maintains representatives in most of the principal neighbouring states of Germany, a minister at Paris, and consuls in London and some of the American capitals. It has one vote in the full council of the German confederation; and divides one in the lesser council, and the 17th place in the diet, with the other Hanse towns.

FRANKFORT, a town of the U. States of America, Kentucky, of which it is the cap., co. Franklin, on both sides the Kentucky, which is here crossed by a bridge, 63 m. W.S.W. Cincinnati. Pop., in 1835, about 4,000. The town is buried among steep hills, and the banks of the river are here precipitous, and from 400 to 500 ft. in height. Frankfort is well built, chiefly of stone, but many of the private as well as public buildings are of fine white marble. The principal public edifices: in 1835, were the state-house, with a fine stone portico; the penitentiary, having generally about 100 inmates; three churches, an academy, county court-house, and several manufacturing establishments, warehouses, &c. It is a place of some trade: steam vessels navigate the Kentucky river as far as this town, and at certain seasons three or four are kept to regular employment. (*Stuart's America; Higginson's Winter in the West.*)

FRASCATI, (an. Tusculum), a town of Central Italy, Papal States, comarca di Roma, 11 m. S.E. Rome. Pop. usually about 4,500, but during summer this number is considerably increased by the influx of visitors. It is beautifully situated on the declivity of a hill commanding an extensive view of the surrounding country; but except the *piazza* in which the cathedral is situated, the town is dirty and inconvenient. Its ruins, and the surrounding villas, constitute its chief attraction; but the latter are now falling into neglect, the present fashion of the Roman nobility being to pass the summer at Albano. The principal villas are those of Counts Aldobrandini, Bracciano, Falconieri, and Ruffinelli, on the grounds of which lie the ruins of the ancient Tusculum. The splendid mansion of the Borghese family, Monte Dragone, is now neglected, and in a state of decay. Frascati has a public seminary, and numerous convents, churches, and public fountains. Its bishop is always one of the 5 members of the highest episcopal council. The ruins of Tusculum (*municipium clausissimum*, Cicero pro Fonteio, § 14.) comprise an amphitheatre, a theatre, an immense hall, supposed to have been attached to bath fountains, &c. This was one of the most ancient cities of Italy, its foundation being ascribed to Telegonus the son of Circe. It was strong, as well by its position as by the walls by which it was surrounded, portions of which still exist. It was, also, one of the most faithful of the allies of Rome; and successfully resisted an attack by Hannibal. The top of the hill on which Tusculum was built, 4,075 French ft. above the level of the sea, was surrounded by a citadel, now wholly destroyed. Like Frascati, in modern times, Tusculum was crowded with the villas of distinguished Roman citizens, among which may be mentioned those of Lucullus and Mæcenus. But the fame of all the other villas has been wholly eclipsed by that of Cicero, so often mentioned in his works, and from which his beautiful ethical disquisitions, entitled the *Disputationes Tusculanae*, have received their name. The attempts that have been made to identify the site of this famous villa have had but little success. (*Brit. Rome*, &c., i. 453.; and ii. 293, &c.; *Cramer's Ancient Italy*, ii. 44, &c.)

FRASERBURGH, a sea-port and bor. of regality, Scotland, co. Aberdeen, on its N.E. coast, on a slight eminence S. side of Kinnaird Head, a bold promontory, on which are an old castle and light-house, 130 ft. above the level of the sea at high water; 184 m. E. Banff, and 37 m. N. by E. Aberdeen. Pop. (1836) 3,510; including the parish, 3,080; but during the herring fishery, which extends annually from July to September, there is an increase of not less than 1,900. (*New Statist. Account of Scotland*, i. 419, &c., p. 362.) The town is nearly square. Most of its streets cross each other at right angles. A considerable number of new houses have been built within these few years. The chief public buildings are the parish church, the Episcopal chapel, and the jail.

The cross, which is of a hexagonal form, is reckoned a fine structure; the area of its base is 800 ft. There are (besides 8 Sunday-schools, attended by 300 children) no fewer than 10 schools in the parish, of which only one is endowed; 5 taught by male, and 5 by female, teachers; aggregate number of pupils, 500, or about a sixth part of the whole pop., are being instructed at the same time. (*Id.* p. 257.) The harbour has been of late much enlarged and improved, partly at the expense of government. It embraces an area of upwards of 6 Scotch acres, nearly a half of which has been excavated along the piers and jetties. It is of easy access; and as it affords excellent anchorage for ships of every size, it has been found to be of great importance to the shipping interest in general on this coast. Eight vessels, from 45 to 185 tons, belong to the port. In 1839, the number of boats belonging to the town employed in the herring fishery, decked and undecked, was 145, which employed 69½ fishermen, exclusive of coopers, gutters and cleaners, &c. During the same year, 52,251 barrels of herring were cured at Fraserburgh. Dried and pickled cod are exported to the extent of about 2,000, sterling; grain of various kinds, about 12,000 qrs.; potatoes, 6,000 bolls. The harbour dues were in the same time so low as 6s. per annum; they were, in 1839, 1,100. There are three branch banks in the town.

The town and harbour existed above two centuries ago, the former having been erected into a burgh of regality in 1613, called Fraserburgh, in honour of Sir Alexander Fraser of Philforth (now represented by Lord Saltoun), who obtained the charter. The government of the burgh is vested in Lord Saltoun, its superior, who enjoys the hereditary right and authority of provost, with power to nominate and appoint the magistrates and council, with the advice and consent of the old. The same Sir Alexander Fraser obtained a charter from the crown, in 1592, for the erection and endowment of a university; and at the west end of the town there is an old quadrangular tower of three stories, which formed part of a building originally intended for this seminary. In 1597, Mr. Charles Ferme, of the University of Edinburgh, was elected principal of this intended college; but from causes not explained, probably from want of funds, the plan was abandoned. (*New Stat. Acc. of Scotland; Gray's Hist. of Univ. of Edin.*, p. 33.)

FREDERICKSHALL, a marit. town of Norway, gov. Agerhuus, at the influx of a small river into the Ide-fjord, near the N.E. angle of the Skagerrack, 57 m. S.S.E. Christiania. Pop. about 4,000. It is an open town, but immediately above it, on a perpendicular rock, 400 ft. in height, overhanging the sea, is the strong fortress of Frederickskælen, at the siege of which Charles XII., king of Sweden, was killed, on the 30th of November, 1718. It was doubted for a while whether the king met his death by a ball from the fortress, or had been assassinated; but there seems to be no good ground for supposing that treachery had any thing to do with the matter.* Frederickskælen spreads irregularly round the rock on which the castle is built; "it is a strange-looking little town, in which houses, rocks, and water are curiously mingled. One street is terminated by a perpendicular rock; another by a deep creek; and, as there are only 3 or 4 little streets in the town, it has at least the praise of being singularly picturesque." (*Norway*, &c. p. 289.) The streets, though few, are wide and regular, presenting many handsome houses, generally 2 stories high; all of which appear to have been built since the conflagration, in 1769, by which nearly the whole place was laid in ashes. A considerable trade in timber is carried on, and there are a few manufactures of linens, tobacco, &c.

The castle of Frederickskælen is one of the most inaccessible fortresses in Europe. The place suffered greatly by the fire alluded to above, and is now in a state of great neglect. An obelisk has been erected by the present king of Sweden (Bernadotte), on the place where Charles XII. fell. (*Cont. N. of Europe*, v. 18. &c.; *Ingis*, p. 289, &c.)

FREIBERG, a town of the k. of Saxony, and cap. of its mining district, cit. Dresden; near the E. arm of the Mulde, 19 m. S.W. Dresden, and 50 m. S.E. Leipzig. Pop. with its suburbs, 11,359. It is an ancient imperial city, and is still surrounded by old walls and a ditch; but the greater part of its fortifications are now laid out in gardens and public walks. It is well built, paved, and lighted. It has a cathedral, a handsome Gothic edifice, with a richly ornamented porch, in the Byzantine style, called the *Golden Gate*; some curious carved stone pulpits; the tomb of Werner the geologist; a chapel in which the Protestant princes of Saxony, from 1541 to 1634, were buried; and a remarkable monument with an alabaster statue of the Elector Maurice, who died of the wounds he received at the battle of Sievershausen, on the 9th of July, 1633, when he completely

* Johnson has availed himself of this suspicion, in his estimable character of Charles XII. —

"He fell was destined to a barren strand,
A petty fortress, and a dubious hand."

defeated the army of the Margrave of Brandenburg. There are 4 other churches, one of which has a spire upwards of 210 ft. high, and an orphan asylum. With out the town is the old castle of Freudenstein, now used as a corn magazine. The rise and fall of Freiburg has been determined by the productiveness of its silver mines, to the discovery of which it owed its origin in the 12th century. In the height of its prosperity before the 30 years' war, it is said to have had 32,000 inhabs. Its pop., together with the produce of its mines, has of late very much fallen off; owing to the richest veins being exhausted, or to the shafts having been driven so deep that it is next to impossible to drain off the water. Still, however, there are in the vicinity numerous mines of silver, copper, lead, and cobalt, employing altogether about 4,600 miners. The principal silver mine is called the *Himmelsflur*, and is said to be the first in Europe, as well for the quantity of ore it furnishes, as for the excellence of its works. It has been wrought upwards of 400 years, and for 200 yielded silver to the annual amount of 95,000 crowns. This, however, is a very poor return; and if we may depend on the statements of the produce of the Freiburg mines given in the *Comptes Rendus* *Lezcom* and other early works, the country appears to be exceedingly unimportant in a commercial, however much they may be distinguished in a scientific, point of view. According to Breithaupt, they had been wrought for 640 years previously to 1825, during which time they are said to have yielded 82,000 quintals of fine silver, being under 130 quintals a year, or about 45,000*l.* a year, at an average. During the 49 years, from 1769 to 1818, the total produce is said to have amounted to 2,176 quintals, being, at an average, less than the inconsiderable quantity of 45 quintals a year. In 1833 their produce is said to have been worth 228,590 rix-dollars, or about 105,000*l.*; being about one fifth part of the value of the tin annually produced in Great Britain, and one thirteenth part of that of the copper!

The ore is smelted at the village of Halsbrücke, about 3 m. from Freiburg, where there are numerous furnaces, forges, &c., and where the process of amalgamation is conducted on scientific principles. Freiburg has manufactures of gold and silver lace, employing 700 hands; a woollen cloth and cassimere factory, in which, besides steam-engines, 110 hands are employed; manufactures of lace, cotton fabrics, and thread, white lead, litharge, vitriol, leather, copper ware, &c.; some extensive breweries; and a shot foundry, the only one in the kingdom. It is the seat of the high board of mines (*Oberbergamt*), and that of foundations (*Oberbaurath*), with supreme jurisdiction over all such establishments throughout the kingdom. It has a gymnasium with a good library; but its most celebrated establishment is its mining academy, founded in 1765. It owes its principal celebrity to Werner, appointed professor of mineralogy in it in 1775: his eloquence and the charm of his manner inspired the greatest enthusiasm into his pupils, and besides raising the school of Freiburg to the highest eminence, and attracting to it students from the most distant countries, gave a great stimulus to the science. It is not, however, to be denied that many of Werner's general conclusions were bottomed on the narrowest and most insufficient data. "He had merely explored a small portion of Germany, and conceived, and persuaded others to believe, that the whole surface of our planet, and all the mountain chains in the world, were made after the model of his own province, many of the most important appearances in which he had misinterpreted." (*Lyeell's Geology*, i. 82. 3d ed.) Hence it is that most of the distinguishing principles of the Wernerian system of geology have been successively overturned; and it is now admitted that his merit consisted far more in the attention he drew to mineralogy and geology, than in his discoveries or theories. There are now about 10 professors in the school of Freiburg, who give instruction in the working of mines and of metals, and in chemistry, and all the accessory sciences. A specified number of Saxon pupils receive gratuitous instruction in this school, some of whom work as miners for a certain time each day, receiving higher wages than the ordinary miners. There is also a preparatory school to qualify pupils for the academy. Attached to the latter are many scientific collections, and among others the celebrated collection of precious stones amassed by Werner, and bequeathed by him to the academy.

Freiburg was long the residence of the Saxon princes, who bestowed on it many immunities and privileges. It suffered greatly during both the 30 years' and the 7 years' war. (*Berghaus; Müller; Murray's Handbook; Encycl. des Gens du Monde.*)

FREIBURG, or FRIBOURG, a canton of Switzerland, the ninth in rank in the confederation, in the W. part of which it is situated, between lat. 47° 27' and 47° 51' and long. 6° 44' and 7° 23' E.; having for the most part N. and E. the Bernese territory, and S. and W. that of Vaud. A detached portion to the W. has for its

N.W. boundary the Lake of Neuchâtel, and is every where else enclosed by the cant. Vaud. Its greatest length N. and S. is about 40 m., and its breadth varies from 8 to 36 m. Area, 564 sq. m. Pop. (1838) 91,145. Its N. part is almost a level plain, or at most only hilly; but proceeding S. the surface becomes more uneven, and the S. half of the canton is covered with mountains, appertaining partly to the Jura system and partly to the Bernese Alps, but none of their summits reach the limit of perpetual snow. The principal are the *Dent de Breiniger*, 7,836 ft.; the *D. de Follières*, 7,667 ft.; and M. Moleson, 6,572 ft. high. Nearly the whole canton is included in the basin of the Aar, its centre being traversed by the Saane, or Sarine, an affluent of that river. The Broye is the other principal stream. The chief lake is that of Morat (*Murtensee*) in the N., through which the last-named river flows: it is 6 m. long by 2 m. broad, and very abundant in fish, particularly fine eels. Climate mild in the N., but rigorous in winter in the S. The highest mountains are composed principally of a coarse-grained limestone, containing many flints; those of inferior height of sandstone. A considerable proportion of the land is fertile: it has about 10,000 acres of arable land, 58,600 do. meadows, 30,000 do. of pasture land, 700 do. vineyards, and the forests are supposed to comprise 34,500 acres. Agriculture is the chief pursuit of the inhab. in the N., and cattle-rearing in the S. districts. Enough of corn is grown for home consumption, but the dairy husbandry is the most important branch of industry, and is in a more advanced state than in any other Swiss canton. The annual produce of cheese is estimated at 40,000 cwt., worth 1,200,000 fr. The famous Gruyère cheese, produced in the district of that name, in the valley of the Sarine, stands decidedly at the head of the Swiss cheeses, and is highly prized in this and other countries. The average produce is about 2,000 cwt. a year, and its average price on the spot about 4*l.* per lb. About 10 years ago the stock of black cattle amounted to 48,000; horses to 13,000; and sheep, goats, hogs, &c. to 5,000. The breeds of horses and black cattle are considered the best in the confederation, and large markets for the sale of both are held at Rotmont, Bulle, and Freiburg. Gardens, orchards, vineyards, &c. are most numerous in the N. Tobacco, oleaginous plants, hemp, flax, &c. are grown, but in no great quantities. The produce of timber is important. Turf is procured in many places, coal only in the S., and to an inconsiderable amount. There is a glass factory at Semsales, employing 150 workmen. The other principal manufactures are those of straw-hats, leather, and paper, but they are quite insignificant. The chief article of export besides cheese is timber to France, from which about 22,000 or 23,000 cwt. of salt are imported yearly. The people generally are in comfortable circumstances. The public roads, which were formerly very bad, have been of late years greatly improved. The canton is divided into 13 circles or districts. Chief towns, Freiburg, the cap., Morat, Gruyère, Estavayer-le-Bas, and Rotmont; but, except the first, none has 1,500 inhab. 7-8ths of the pop. are Rom. Cath.: the Protestants, about 8,400, reside chiefly in the district of Morat. German is spoken in the N.E., and a dialect of Romansche or Italian in the S.; but French is the language most universally employed in Fribourg, and has been recently adopted as that of all state proceedings. Since 1830, the government has been wholly democratic. It consists of a great and petty council; the former, which has the sole legislative power, consists of 88 members, or about one for every thousand of the inhab.; all males above 25 years of age, not servants or subject to foreign powers, have the right to vote in the appointment of the *electors* of the central body. The petty or executive council is composed of 13 members chosen by the legislative body, who also appoint for life the 13 judges of the supreme court of appeal. The great council is presided over by an *Aoyger*, who holds office for two years only; while the council itself exists for nine years. Each circle has its own local council, a governor called an *Oberammann*, and a court of justice with appeal to that in the cap. Personal freedom, the privilege of petitioning, and the abolition of feudal rights, torture, &c., have been guaranteed; as was the liberty of the press a few years since; but of late the latter has been placed under restraint. Education in this cant. was formerly in a lower state than in many others; but in 1829 there were 239 primary schools, attended by 12,538 children. The places for superior instruction are chiefly in the town of Freiburg (which see), and the Protestant college at Morat.

Freiburg furnishes a contingent of 1,340 men to the army of the Swiss confederation; and contributes 16,800 francs annually to its expenditure. Besides the above contingent, and an equally numerous *corps de réserve*, there is a militia of all the male pop. between 16 or 20 and 45 or 60. The total public revenue in 1838 amounted to 407,127 Swiss francs, and the expenditure to 408,580 do. Before the 11th century, this territory formed a part of the kingdom of Burgundy, but afterwards belonged to the

dukes of Zähringen, and other feudal nobles. Its history, after the 15th century, is for the most part that of its cap.

FREIBURG, or **FAISOUBO**, a town of Switzerland, cap. of the above canton, on both sides the Sarine, 15 m. S.W. Bern, and 32 m. N.E. Lausanne; lat. 46° 48' 30" N., long. 7° 9' 50" E. Pop. 7,964. (*Kuenlin*, 1834.) Few towns are so singularly situated. It is naturally divided into the Upper and Lower town; the former built on the summits of a succession of rocky hills, and the latter in the narrow valley of the Sarine, which is here crossed by 3 bridges of wood, and one of stone. The upper town is the principal. "Many of its houses stand on the very edge of the precipice overhanging the river; and their quaint architecture, the long line of unembellished walls stretching up hill and down dale, varied by the chain of feudal watch-towers and gateways of the ancient fortifications, which still exist in a perfect state, together with the singular and romantic features of the gorge of the Sarine, give the distant view of the town an aspect different from that of any other in Europe, which is at once imposing and highly picturesque. The narrow and dirty streets, and mean buildings of the interior, however, do not altogether correspond with these outward promises of interest." (*Murray's Handb.* pp. 113, 114.) The great glory of the town is its iron suspension bridge, the longest and finest in Europe. It is erected across the ravine through which the river flows, and is 805 ft. in length, 28 ft. in breadth, and 374 ft. in elevation; being more than one third longer, and nearly as much higher, than the Menai bridge between Anglesea and Carnarvonshire. "It is supported by four cables of iron wire, each containing 1,056 wires, the united strength of which is capable of supporting three times the weight which the bridge will be ever likely to bear." (*Murray*.) The materials of which it is composed are almost exclusively Swiss. It was completed in three years, at an expense of about 25,000*l.*, under M. Chaley, an engineer of Lyons; and was thrown open to the public in 1834. Freiburg has 9 convents, and 4 churches, besides numerous chapels. The principal church, that of St. Nicholas, is a rather handsome Gothic edifice, with a spire elevated 376 ft., being the highest in Switzerland. It has some curious Jesu-reliefs and paintings; and an organ with 7,800 pipes, reckoned one of the finest on the Continent. The Jesuits have a monastery at Freiburg, founded in 1584. It was suppressed previously to 1815, when it was restored by a decree of the great council of the canton. It supports 60 brothers, and has attached to it a college, in which between 300 and 400 pupils are educated, mostly the children of French and German R. Catholic families. The professors of the college also lecture at the lyceum, an institution with 12 professors, and which in 1829 had 566 pupils. There are various other schools under the direction of the religious bodies. The remaining objects most worthy of notice are the town-hall, on the site of an ancient castle of the dukes of Zähringen, the hospital, orphan asylum, workhouse, house of correction, some public baths, several public libraries, and several learned societies. Freiburg is the seat of government, and of the court of appeal for the canton, and the residence of the R. Cath. bishop of Lausanne and Geneva. It has a few manufactories of straw-hats, porcelain, tobacco, chicory, paper, hats, and musical instruments, and dyeing houses, tanneries, and breweries. Most of its pop. are Catholics; and it is a singular circumstance that the inhab. of the upper town speak French, while those of the lower speak German; and many understand only one of those languages. The upper town was founded, in 1175, by duke Berchtold of Zähringen; the lower town had existed previously. In 1277 Freiburg fell into the possession of Rodolph of Hapsburg; but in 1450 it became a free city of the empire. The duke of Savoy soon afterwards constituted himself its protector; but the Freiburgers having distinguished themselves in the contest against Charles the Bold of Burgundy, the city and its territory were reserved into the Swiss Confederation in 1481. In 1476, a celebrated Swiss diet sat within the walls of Freiburg, and in 1603 another, the latter being that at which the French Act of Mediation was accepted. (*Ebel; Combach; Kuenlin, Gemälde der Schweiz; Kant. Freiburg; Helvetia Alpina*, &c.)

FRÉJUS (an. *Forum Julii*), a town of France, dép. Var, cap. cant., in a spacious plain, 1 m. from the Mediterranean, and 10 m. S.E. Draguignan. Pop. 2,800. Its position contrasts painfully with its ancient condition. Formerly it was a laqueus in circ., was surrounded by strong walls flanked with towers, and had 40,000 inhab. Its amphitheatre, the outer circ. of which is 3164 ft., still exists in a ruined state. Its port, which was under its walls, and communicated with the sea by means of a canal 14 m. in length, was bordered by fine quays, the traces of which still exist; as well as part of a light-house, and a large triumphal arch, which formed the entrance from the port into the town. The sites of the port and canal are now occupied by gardens. The sea-port was formerly supplied with water from

the river Siagne, by means of a fine aqueduct, 154 m. in length; this noble work is in great part destroyed. Frejus has a church, and episcopal palace, both of which are of Gothic architecture, but in part constructed of the materials of Roman edifices. The chancel of the latter is an octagonal building, ornamented with eight ancient Corinthian columns. Numerous other remains of antiquity may be seen in the neighbourhood. It has a seminary and an hospital, both modern and handsome buildings. Frejus is the seat of a bishopric, and of a chamber of commerce; it has some bottle-cork factories, and water-works for sawing timber; but its trade is now next to nothing, and its ancient fleets have dwindled down to a few boats.

This town was a place of importance in the time of Julius Cæsar, who gave it his own name. Augustus sent thither the 800 galleys taken from Antony at the battle of Actium, made *Forum Julii* a naval station of importance, and planted in it a colony of soldiers of the 8th legion. Agrippa further devoted his endeavours to increase the prosperity of the town. Its strong fortifications protected it for a considerable period against the barbarians; but about the year 940 it was destroyed by the Saracens, nor has it since recovered so much as the shadow of its former prosperity. At St. Raphael, a little fishing village about 14 m. from Frejus, Napoleon disembarked on his return from Egypt, in 1799, and again embarked for Elba in 1814.

Frejus was the birthplace in antiquity of Julius Agricola, C. Gallus the poet, and Roscius the actor; and in modern times of the Abbé Sieyès. (*Hugo, art. Var; Guide du Voyageur; Dict. Géog.*)

FREYBURG, or **FREIBOURG**, a city of the grand duchy of Baden, circ. Upper Rhine, of which it is the cap., on the Dreysam, a tributary of the Rhine, within the skirts of the Black Forest, and at the entrance of the Höllenthal, 714 m. S.S.W. Carlsruhe, and 33 m. N.N.E. Basle. Pop. 12,200 (exclusive of the garrison, students, &c.). The town was originally fortified by its founder; but its fortifications were levelled by the French in 1794, and their place is now occupied by fine public walks and vineyards, from which excellent wine is obtained. It is generally well-built and lighted, contains several good squares, and has numerous public edifices. The principal of the latter is the *minster* or cathedral, one of the most perfect Gothic buildings in Germany, and remarkable alike for the delicate symmetry of its proportions, and the good taste of its decorations. It was begun by Conrad of Zähringen in the 12th, but not completed till towards the end of the ensuing century. The whole edifice is built of red sandstone. The W. front, with a magnificent portal, and the tower and spire, 880 ft. high*, which surmount it, were the work of the celebrated Erwin of Steinbach, the architect of Strasburg cathedral. The spire is of the finest openwork tracery, all of stone, and of extreme boldness as well as lightness. The minster contains statues of Berchtold V., and the other dukes of Zähringen who were buried in it; several tombs worthy of notice; a remarkable piece of sculpture of the Lord's Supper, by an artist of the 16th century; paintings by B. Grün, a famous artist also of the 16th century; and some stained glass windows of great beauty. The university, founded in 1454, is in a very flourishing state; it has about 800 students, their number having, for several years past, been on the increase. It is particularly famous as a school of theology, having united with it the high Rom. Cath. seminary of the grand duchy, removed thither from Mersburg. It possesses a good deal of landed property in Württemberg, Baden, and Switzerland; besides which it enjoys considerable government grants, endowments, &c. It has a library with upwards of 100,000 vols., a cabinet of nat. history, museum, fine collection of philosophical instruments, chemical laboratory, anatomical theatre, school for clinical instruction, and a botanic garden. In the church of the university, there are several paintings by Holbein. Freyburg has a grand-ducal, and an archiepiscopal palace, 3 hospitals, a custom-house, a venerable old Gothic building; a new archiepiscopal seminary and church, a Lutheran church, new museum, town-hall, theatre, house of correction, founding and orphan asylums, many other benevolent institutions, a gymnasium, an *Industriegarten*, or school of forest and garden economy; Herder's institute of arts, for copper-plate engraving, and printing and lithography; a geographical institute, teachers' seminary, school for girls kept by Ursuline nuns, and a great number of general and primary schools (including Sunday-schools, &c.). In the centre of the square called the *fish-market*, is a fountain surmounted by a statue of the founder of the city, Duke Berchtold III. of Zähringen. Freyburg is the seat of an archbishopric, with jurisdiction over the whole of the grand-duchy, and the bishoprics of Mayence, Fulda, Rothenburg, and Limburg; of an assize court, and the

* This is the statement of Schröder and Berghaus. The *Encyc. des Sciences*, and some other authorities, make its height 515 French (2462 Eng.) ft., which would be 73 ft. Eng. higher than the spire of Strasburg, usually considered the loftiest in Europe.

superior courts of law, and government offices for the circle of the Upper Rhine. Its chief sources of prosperity are its university and other public establishments; but it has also manufactures of cheese, soap, starch, leather, tobacco, bells and other metallic articles, good musical and surgical instruments, earthenware, &c.; besides several paper-mills and dyeing-houses. In its vicinity are the fine gardens of Ludwigsbühl; the ruins of the castle of Zehringen, and many other spots admired for their picturesque beauty. Freyburg was founded in 1118, by Duke Berchtold III.; it was long the cap. of the landgraviate of Thuringia; belonged successively to the house of Austria and the Duke of Modena; and was finally ceded to Baden by the treaty of Presburg. (*Schreiberv. Guide du Rhin*, pp. 26, 27; *Cannabich, Lehrb.* p. 497; *Berghaus, Encycl. des Géns du Monde*, &c.)

FRIESLAND, a prov. of Holland; which see.
FRIGENTO, or FRICENTO, a town of S. Italy, k. Naples, prov. Princip. Ultra, cap. cant., 17 m. E.N.E. Avellino. Pop. 3,000. Swinburne says, "It is a ruinous place, on a hill, most wretchedly built, and scantily provided with the necessaries of life." (1. 127.) When he was there (1777), it had not one tolerable inn. It has, however, a fine cathedral, containing some excellent paintings. (*Dict. Géog.*) Its inhab. subsist by the sale of sheep, hogs, and corn. This town is said by some antiquaries to occupy the site of the ancient *Frequentum*, and by others that of *Æculanum*, besieged by Sylla during the civil wars; but the probability is that it is different from either. Near it is a valley, supposed, apparently on good grounds, to be identical with the *Amaeniti valles* of Virgil. It is narrow, and is pressed in on both sides by high ridges thickly covered with copes of oak. The bottom of the dell is bare and arid. In the lowest part, and close under one of the hills, is an oval pool, not 50 ft. in diameter, the water in which boils, and spouts up in jets d'eau, at irregular intervals, to a height of several feet, with a hissing noise, accompanied by strong sulphureous and mephitic exhalations. (*Swinburne, ubi supra*.)

It was through this orifice that the fury Alecto descended to Tartarus, and the appearance of the place perfectly corresponds with the admirable description given by Virgil:—

*Est locus Italia in medio sub montibus altis,
Nobilis, et fæpe multis memoratus in ævo
Amaeniti valles. Dæmus hunc frondibus æstrum
Urget utrinque lacus nemoris, modique fragorus
Dunt sonitus saxæ et toro vertice torrens.
Hic specus horrendum, et sæpi spiracula torrens.
Monstrantur, ruptoque ingens Achærotæ vorago
Pestiferas aperit faucis."*

Æn. id. vii. lin. 563.

FROME, or FROME-SELWOOD, a parl. bor., town, and par. of England, co. Somerset, hund. Frome, near the W. border of the co., 11 m. S. by E. Bath. Area of par., 6,960 acres. Pop. of ditto in 1851, 12,240, of which the town might have about 11,200. It is situated on an irregular acclivity, rising abruptly from the Frome, or stream whence it derives its name, and which is here crossed by a bridge of 5 arches. The principal street contains many well-built houses and a good modern market-place; between 30 and 40 other streets, mostly very narrow and irregular, being connected with it on either side. It is paved, lighted, and amply supplied with water. "It may be said to be in a prosperous state, though some considerable portion of its inhab. have no employment, the introduction of powerful machinery having superseded manual labour." (*Boundary Report*.) The church, a spacious structure in the later Gothic style, with a tower and fine octagonal spire 120 ft. in height, has four ancient chapels, and many interesting monuments; another church, built in 1817 by subscription, contains 400 free sittings; and a third, at Woodlands, about 3 m. from the town, was built and endowed in 1712. There are also five dissenting chapels; an asylum, for the maintenance, education, and apprenticeship of 40 poor girls; and an almshouse for 20 poor men, both comprised in a substantial quadrangular building erected in 1790, and endowed with funded property, whence an income of 800*l.* a year is derived for the above purposes; a free grammar school, founded in the reign of Edward VI.; there is a small endowment, but no scholars at present on the foundation; a charity school, in which 27 boys are clothed and educated for four years, and then apprenticed; an almshouse for 21 old women, founded at the same period as the charity school (Edw. IV.), and, connected with the same endowment, now producing 70*l.* a year. There is also a national school, for 200 boys and 160 girls; and several large Sunday schools. The chief market, Wednesday; a smaller one, Saturday. Fairs, chiefly for cattle and cheese, Feb. 24, and Nov. 25. The woollen manufacture is the ancient staple of the town, and furnishes the chief employment of the pop. The goods consist chiefly of the finer kinds of broad-cloth and kerseymers. In 1838 there were 4 woollen mills, employing 345 males and 166 females, at work in the par.; and a silk mill, employing about 170

hands. Cards for dressing wool are also manufactured, though to a much less extent than formerly, when it supplied them to a great part of the kingdom. There is a canal hence to Stalbridge, with a branch to Wells and Bradford. The Reform Act conferred, for the first time, on Frome the privilege of sending 1 m. to the H. of C. The limits of the parl. bor. comprise a nearly square space, extending about 1 m. each way. Registered electors, in 1838-39, 310. The neighbourhood is fertile and picturesque, and contains many old family mansions. Frome has long been celebrated for its excellent ale. Two courts-leet are held, one by the Marquis of Bath, the other by the Earl of Cork, lords of the manor. Petty sessions for the division are also held in the town.

FROSINONE (an. *Frasumo*), a town of S. Italy, Papal States, cap. deleg. of same name, at the foot of a high hill near the Cosa, and on the upper road between Rome and Naples; 47½ m. E.S.E. the former city. Pop. 6,500. It is very ill built, but has many churches and convents; is the seat of a bishopric, and the residence of a card. delegate. It has an annual fair, which begins at Whitsuntide, and lasts 20 days. Being near the confines of the Neapolitan territory, its neighbourhood is famous for brigandage; to repress which a criminal tribunal, established in it, offers a reward for the heads of brigands. (*See* PAPAL STATES; *Rampoldi*, &c.)

FUERTE (El), an inland city of Mexico, state of Sonora, of which it is the cap.; on a river of the same name, 350 m. N.W. by W. Durango, and 770 m. N.W. Mexico. Pop. (1835) 5,000. It was originally a military station, established by the Spaniards, for their progress towards the N. It is now a commercial depot for goods passing to and from the port of Guaymas; and being somewhat centrally situated, has been fixed on as the seat of the state congress, governor, and supreme tribunal of justice. Its importance is, however, wholly due to these circumstances; its local position being far from favourable. It stands on the N. ridge of a vast sandy plain, destitute of vegetation, except in the rainy season, or in spots where the vicinity of the mountains, or the confluence of two large streams, ensure a supply of water; added to which the heat in summer is almost insupportable. (*Ward's Mexico*, ii. 324, &c.)

FULDA, a town of W. Germany, cap. prov. Fulda, G. D. Hesse-Cassel, on the river of same name, which is here crossed by a handsome stone bridge, 62 m. S.S.E. Cassel, and 56 m. N.E. Frankfurt-on-the-Main. Pop. inc. suburbs, 10,000. It is a pretty town in a very agreeable situation; has some good streets, and several squares; of the latter, that in which the cathedral stands is the principal, and is ornamented with two obelisks upwards of 40 ft. high. The cathedral is an elegant edifice, about 335 ft. long, by 213 ft. in breadth; it has a tower 190 ft., and a handsome cupola 190 ft. high, the latter raised upon 16 Ionic columns; a high altar and 18 others, 2 organs, the largest of which is one of the finest in Germany, and the tomb of St. Boniface. There are 3 other Rom. Cath. churches, 2 Lutheran churches, and some other places of worship, a bishop's palace and garden, a Franciscan monastery, Benedictine convent, R. Cath. seminary, public library, gymnasium, lyceum, school of industry, and many other schools; several hospitals, an orphan asylum, various benevolent institutions, an arsenal, house of correction, workhouse, and *mont-de-piété*. Fulda is the residence of a R. Cath. bishop, with supreme ecclesiastical jurisdiction throughout Hesse-Cassel; and is the seat of the superior judicial court of the prov. It has factories of stockings, linen and woollen fabrics, tobacco, leather, &c.; dye-houses, and wax, bleaching and saltpetre works, about a league E. of the town is Adolpheus, or the "Pheasant," a country seat formerly belonging to the Prince-bishops of Fulda. (*Berghaus, Allg. Länder, &c.*; *Cannabich*, pp. 458, 459; *Encycl. des Géns du Monde*.)

FUNCHAL, a town of Madeira, which see.
FUNEN, or FYEN, an island of the Danish Archipelago, the next in size after Zealand, lying between it and continental Denmark; separated from the former by the Great, and from the latter by the Little Belt. It extends between lat. 55° 2' and 56° 28' N. and long. 9° 42' and 10° 53' E. Length, N.E. to S.W., 60 m. Area, 1,187 sq. m. Pop., in 1834, 151,600. Surface generally undulating; there are a few hills in the S., but they rise to no considerable height. The shores are very much indented; and in the N.E. the Odense-fjord extends inland for several miles. The chief river is that of Odensee, which runs through the centre of the island; rivulets, lakes, and marshes numerous. Climate humid, and variable; soil very productive. Funen presents a less agreeable prospect than Zealand, owing not to its more scanty fertility, but to the great paucity of trees. The crops seem equally abundant, and the flocks equally numerous; and, indeed, Funen is more an exporting country than Zealand, in both corn and cattle. (*Light, Norway*, &c. 327-28.) Barley, oats, buckwheat, rye, and vegetables, are grown in quantities much beyond those required for home consumption; fax and hemp are

largely cultivated, and orchards are numerous. The honey is very superior, and an article of considerable export. Turf, clay, and chalk, are the only mineral products of value. There are a few manufactures of woollen and linen fabrics; and many domestic ones of stockings, and other articles. Besides corn, cattle, horses, and honey, the chief exports are fruit, lard, butter, leather, salted meat, and some manufactured goods; the trade is brisk, and chiefly with Norway and Sweden. Funen, together with the islands of Langeland, Taaasing, &c., forms a prov. of Denmark. Chief towns, Odensee, the cap., Svendborg, and Nyeborg. (*Inglish, Norway, &c.: Dict. Géographique, &c.*)

FUNFKIRCHEN (Hungar. *Pecs*), one of the most an. towns of Hungary, co. Baranya, of which it is the cap., on the declivity of a hill in a rich country, 404 m. S. S. W. Buda, and 40 m. N. W. by N. Eszsek. Pop. 11,323. Besides the cathedral, which is the oldest religious edifice in Hungary, and occupies the site of a Roman fortress, it has six churches, and several convents. There are also numerous remains of mosques, baths, and other Turkish edifices, Fünfkirchen having been in the possession of the Turks from 1543 to 1686. This town is the residence of a Rom. Cath. bishop, and has a seminary for the R. Cath. clergy, a gymnasium, normal and military schools, a library, and a cabinet of coins. It has also manufactures of woollen cloths, flannels, leather, and tobacco, and a considerable trade, principally in wine, tobacco, and gail-nuts, the produce of the adjacent country. The town is noted for warm mineral baths, and about 2 m. distant from it is a remarkable stalactite cavern. (*English, Germany, Hungary, &c.*)

FURRUCKABAD, a distr. of Hindostan, prov. Agra, presid. Bengal, almost wholly included in the Doab; between lat. 27° and 28° N., and long. 79° 40' and 79° 40' E.; having N. the districts of Moradabad and Bareilly, W. the dom. of Oude and the distr. of Cawnpore, and S. and W. those of Etawah and Alighur. Area, 1,850 sq. m. This distr. suffered greatly from the anarchy that prevailed in this part of India before the British rule was established; but in 1813 nearly 6-7ths of the ground fit for tillage were in cultivation, and the land revenue, 102,491, was nearly all realised. In 1229-30, the land assessment amounted to 173,684.

FURRUCKABAD (Karakhabad, a happy residence), an inland city of Hindostan, prov. Agra, cap. of the above district, near the S. bank of the Ganges, 82 m. E. N. E. Agra, 156 m. N. W. Allahabad, and 80 m. W. N. W. Lucknow. Pop. 70,000. This city is considered the chief commercial emporium of the ceded and conquered provinces, and is said to be the common resort of needy and dissolute characters from the rest of Hindostan. It is surrounded by a wall, kept in tolerable repair: streets in parts wide, and many of the open spots and buildings shaded by trees, excepting in the principal thoroughfares, most of the houses are of mud. Here, in 1805, Lord Lake surprised and obtained a decisive victory over Holcar's cavalry. (*Hamilton's E. I. Gaz. l. 550-552.; Reports on E. I. Company's Affairs.*)

FURTH, a town of Bavaria, circ. Middle-Franconia, on the Regnitz, 20 m. N. E. Anspach. Pop. 16,000, of whom 2,600 are Jews, and the rest principally Lutherans. It is irregularly built, but contains many good houses; is the seat of a town and district judicial tribunal, and has two Lutheran churches, a Rom. Cath. church, several synagogues, Latin and numerous other schools, besides schools of industry, arts and trades, &c. The Jews who are interdicted from settling in Nuremberg, enjoy in Furth privileges denied them elsewhere on the Continent; they have here a separate court of justice, a Hebrew college, and two printing presses, exclusively devoted to Hebrew publications. It is principally owing to their exertions that Furth has become, next to Nuremberg, the principal manufacturing town in the Bavarian dominion. It has numerous factories of mirrors, chandeliers, lacquered ware, spectacles, lead pencils, tobacco, gold and silver wire, gold leaf, turned brass, wood, horn, and bone wares, stockings and other woollen and cotton fabrics, leather, liquors, coloured paper, buttons, toys, trinkets, pipes, &c. These articles are exported principally to N. and S. America, the Levant, Holland, Spain, Italy, N. Germany, Denmark, and Sweden. Besides the foregoing, there is a considerable trade in other kinds of produce; and a large fair is annually held here. The first railroad for steam carriages in Germany was completed in 1835-36, between this town and Nuremberg, a distance of 44 m., which is usually traversed in 15 minutes. About half way between the two towns, the canal, now in the course of being constructed, to unite the Danube with the Rhine, is carried over the railway. (*Murray, Handbook for S. Germany.*) Furth is first mentioned early in the 10th century. Gustavus Adolphus was defeated in 1631, in an attempt to carry the intrenchments of Wallenstein, in the neighbourhood of this city. It was not till 1818 that Furth obtained its municipal rights. (*Bergmann; Compendium, &c.*)

FUTTEGHUR (Fataghur, the fort of victory), an

inl. town of Hindostan, prov. Agra, on the W. bank of the Ganges, 3 m. E. Furruckabad; lat. 27° 31' N., long. 79° 30' E. It is a British military station, and the residence of the civil authorities of the Furruckabad collectorate, as well as of several European merchants. Most of the houses are built with mud walls, and a mud fort has been erected for the protection of the arsenal. The cantonments possess an elegant theatre. A government mint has been established here. Tents of a superior kind are manufactured in Futteghur. (*Hamilton's E. I. Gaz. l. 550.*)

FUTTEHPOOR, a large inland town of Hindostan, prov. Allahabad, cap. distr. of same name, on the high road from Bengal to the upper provinces, 60 m. N. W. Allahabad; lat. 25° 56' N., long. 80° 45' E. Some years since it appeared prosperous, and contained, besides several good houses, a recently built and elegant mosque. Like most towns in its vicinity, it is surrounded with tombs, and on one side of it is a large endowed *serai* or hotel for the gratuitous accommodation of travellers. (*Hamilton's E. I. Gaz. l. 553.*)

FUTTIPOOR (Sikra), an inland town of Hindostan, prov. Agra, on the British frontier, 12 m. W. S. W. Agra; lat. 26° 6' N., long. 77° 34' E. This town contains the favourite residence of the emperor Acher, who built a stone wall of great extent, with battlements and towers round it, the area within which appears never to have been filled up. The town, which is but small, is built of stone. It contains the spacious and tolerably entire remains of Acher's palace, the tombs of several of his family, and of some Mohammedan saints and statesmen. (*Hamilton's E. I. Gaz. l. 553.*)

FYZABAD (a beautiful residence), an inland town of Hindostan, prov. Oude, of which it was formerly the cap., on the S. bank of the river Kalee, 60 m. E. Lucknow. It is still large and populous; it contains the remains of a fortress, and of the palace of Shuja ul Dowlah.

G.

GAETA (an. *Caicta*), a fortified sea-port town of S. Italy, k. Naples, prov. Terra-di-Lavoro, cap. distr. and cant., at the extremity of a peninsula on the W. shore of Italy, forming the N. W. boundary of the gulph to which it gives name, 4 m. S. S. W. Mola-di-Gaeta, 41 m. N. W. Naples, and 72 m. S. E. Rome; lat. 41° 12' N., long. 13° 30' E. Pop. 14,800, of whom 10,000 reside in the suburbs. It is regarded as one of the keys of the kingdom, being strong from its position, and defended by walls flanked with bastions and redoubts, and by a square castle situated on a rock. Its suburbs are, as their pop. shows, much more extensive than the town itself.

Gaeta is irregularly built; its streets are narrow and steep; those in the city are, however, greatly inferior to those in the suburbs. It has a cathedral with a fine tower, the construction of which is attributed to the emperor Frederic Barbarossa; nine other churches, several convents, a public seminary, an hospital, and a founding asylum. On the isthmus connecting the citadel with the mainland stands the *Torre d'Orlando*, originally the tomb of Plancius; and near the suburb of Castellone is the *Tower of Cicero*. Its port, which has 7 fath. water, though not the largest, is one of the safest and best in Italy. This city is the seat of a bishopric, under the immediate superintendence of the pope. It is the centre of a considerable trade. Its neighbourhood is extremely beautiful, and covered with villas and country houses.

Caicta is very ancient. Virgil says it derived its name from the nurse of Aeneas buried in it:—

"Tu quoque litorebus nostris, *Eneida* nutrit
Aeternam moriens famam, Caicta, sedisti."

Æneid. vii. 1

It became the residence of many opulent patrician families of Rome; and Cicero was put to death, by order of Antony, in its immediate vicinity. After the fall of the western empire, it had a republican form of government, at the head of which, however, was placed a duke, acknowledging the temporal supremacy of the pope. It coined its own money till 1191; in 1425, it was taken by Alphonso V. of Aragon; and since then has belonged to the crown of Naples. In modern times it has been repeatedly besieged; the last siege of any great note was in 1806, when it fell into the hands of the French. It, however, held out against the Austrians for some time both in 1816 and 1821. (*Remond; Cramer's Anc. Italy, li. 124, 126.; Dict. Géog.*)

GAILLAC, a town of France, dép. Tarn, cap. arrond., on the Tarn, 12 m. S. S. W. Alby. Pop. (1696) 5,881. It is ill built, but has been of late considerably improved, and is now also well lighted. It has an extensive suburb, a tribunal of primary jurisdiction, a communal college, a society of agriculture, two hospitals, and a small theatre. It is the seat of a sub-prefecture; and has manufactures of wine casks, hats, leather, and brandy; besides dyeing houses, and docks for building boats. Its neighbourhood

produces some very good strong-bodied, deep-coloured wines, which are said to bear sea voyages perfectly well. These wines constitute the principal exports of Gallia. (*Hugo, art. Tarn; Guide des Voyageurs, &c.*)

GAINSBOROUGH, a market-town, river port, and par. of England, co. Lincoln, wap. Corringham in Lindsey, on the Trent, about 21 m. from its embouchure, in the estuary of the Humber: 16 m. N.W. Lincoln, and 117 m. N. by W. London. Area of par. (including the hamlets of Morton, E. Stockwith, and Walk-erith), 7,810 acres. Pop. of ditto in 1831, 7,535. The town, consisting chiefly of one long street, running parallel with the river, is clean, well-paved, and sufficiently lighted. The church is a neat modern building, erected by the inhab. in 1748; the living, a vicarage attached to one of the stalls in Lincoln cathedral. There are also several places of worship for dissenters of various denominations. The town-hall, which is used also as an assembly-room, is a convenient brick building; the lower part is used as a gaol, and for shops. There is a neat small theatre. The bridge over the Trent, at the N. extremity of the town, built in 1791, is of stone, with 3 elliptical arches. At the N.W. end of the town stands a very singular building, known as the Old Hall, and said to have been a palace of John of Gaunt; but its appearance shows it to be of later date. It is composed of oak timber framing, and forms 3 sides of a quadrangle, the N. side of which was a chapel; gardens were formerly attached, and a moat surrounded it. About ½ m. S. from the town, on the bank of the river, are the Castle hills, mounds supposed to have been erected during the civil wars under Charles I. The tide ascends the Trent as far as Gainsborough, which being reached by vessels of from 150 to 200 tons, has a considerable coasting and some foreign trade; and it possesses means of communicating with the interior by the Chesterfield and Fossdyke canals, &c. A large amount of British and foreign produce is traushipped here; and, in 1830, 376 ships, of the burden of 26,322 tons, entered inwards, and 465 ships, of the burden of 31,977 tons, cleared outwards. The inhabitants of Gainsborough are very desirous to have it made a bonding port, but hitherto this privilege has not been conceded. (*Report on Inland Warehousing.*) Vessels of considerable burden have been built here. A court is held here for the recovery of small debts. Markets on Tuesday, and fairs for cattle and toys on Easter Tuesday and October 20. It is the birth-place of Bishop Patrick, the well-known commentator on the Bible.

GALACZ, or **GALATZ**, a town of Moldavia, on the N. bank of the Danube, between the confluence of the Sereth and the Pruth with that river, 80 m. (direct dist.) W. its Soulineh mouth; lat. 45° 29' N., long. 28° E. Pop. 10,000. ? The town, except the older parts, is ill-built and filthy. "Picture to yourself, upon an eminence sloping rapidly to the water-side, a confused cluster of wooden huts, intersected by irregular streets, paved with trunks of trees, placed from one side to the other; when it is fine weather, a tremendous dust,—converted by rain into deep mud. Imagine these cabins, dark and sombre within; and without, filthy with mud; a sorry caravansera by way of inn, with apartments almost without furniture, and as full of filth as the streets; not the least appearance of order, cleanliness, or arrangement; a town constructed like an encampment—such is Old Galacz." (*St. M. Girardin.*) The houses are all built of unpainted wood, and roofed with the same material. Most of them are limited to a single floor, with a front open towards the street; and goods exposed for sale are spread out on the ground. By the side of Old Galacz, however, a new and superior town is rising. Upon a hill, overlooking the Danube, a few buildings have already sprung up, bearing European aspect; these are 2 stories in height, tiled, and white-washed; have windows, and are furnished in the European style; they are inhabited by consuls, and some of the richer merchants. Galacz is not only the principal port of Moldavia and Wallachia, but, though at a considerable distance inland, it may be said to be the port of the Danube; vessels of 300 tons burden ascend to its quays by the Soulineh or middle mouth; and since the establishment of steam packets on the river, and the opening of its navigation, Galacz has attained to very considerable importance, and is, probably, destined to become one of the greatest emporiums in the vicinity of the Black Sea. It has been made a free port. About 1,000 of its inhab. are said, by Mr. Elliott, to be emigrants from the Ionian Isles. Besides these, a considerable number are Jews and Armenians; but the greater part of the trade has to a late period been carried on by Greek merchants; latterly, however, English and other foreign houses have been established in it. Its principal exports are corn, tallow, wool, butter, live cattle, staves, wax, skins, wines, &c.; the principal imports being olive and other oil, manufactured goods, sugar, coffee, &c. In 1807, 526 vessels arrived at Galacz; of which 8 were British, 50 Russian, 48 Austrian, 145 Greek, 176

Turkish, 37 Ionian, &c. The value of the exports during the same year was estimated at 2,830,000 fr., and that of the imports at 2,794,000 fr. In 1837 the exports of wheat from Galacs amounted to 98,980 quarters; in 1838 to 171,818 qrs.; and in 1839 to 148,117 qrs.: the price free on board in those years being 15s., 16s., and 22s. 8d. per qr. respectively. The export of wheat from Brahlrow in 1839 was 143,184 qrs. Quarantine regulations are strictly enforced, unless performed previously to entering the river. In 1789, the Turks were defeated by the Russians near Galacs, and the town was taken, and in part destroyed by fire. (*Elliott's Travels in Austria, Russia, &c.* 1. 204, 205.; *Commercial Dictionary, &c.*) **GALASHIELS**, a bor. of barony and manufacturing town of Scotland, partly in co. Selkirk, and partly in co. Roxburgh, on both sides the Gala, 1 m. from its influx into the Tweed, 37 m. S.E. Edinburgh, and 50 m. N. Carlisle, and on the line of road between these two towns. Pop. in 1801, 1,214; in 1831, 2,309; now (1840) about 2,400. Though a place of considerable antiquity, most of the buildings are new, because manufactures, to which it owes its present importance and increased size, have only of late years been carried to any great extent. The town is somewhat irregularly built, but it has an interesting and picturesque appearance, being situated in the centre of a fine pastoral district, on the banks of a beautiful stream, and hemmed in by richly wooded hills, of considerable height. The opposite portions of the town are connected by three bridges, two of which (a chain or suspension and a wooden bridge) are for foot passengers only. There are no public buildings of importance, if we except the parish church, and a chapel belonging to the United Associate Synod. The Baptists and Independents have also chapels in the town. The schools are four in number; one of them parochial, the others not: aggregate number of pupils, 354. There are two subscription libraries, a reading room, and a mechanics' institution, in which lectures on science are occasionally delivered.

But Galashiels is chiefly remarkable for its eminence in the woolen manufacture. Situated in the middle of a pastoral country, which yields abundance of wool, the inhabitants seem to have cultivated this manufacture at an early date, though it was long on a rude and limited scale. In 1774, only 722 stones of wool (24 lbs. each) were manufactured; in 1790 the quantity was 2,916 stones; while in 1832 it was 21,600, and now (1840) 24,000. Nearly half the raw material is manufactured into stockings and stocking yarn, fannels, blankets, shawls, and plaids; the remainder into narrow cloths, of various kinds and colours, and crumb cloths, of grey or mixed colours. To this narrow cloth the general name of *weeds* is long given, because it was manufactured on the Tweed, or in its immediate vicinity; but the term is now confined to a particular species, of a mixed indefinite colour. Black and white checks, and tartans of various patterns, are made to a great extent. The tartans made at Bannockburn are of hard-spun yarn; those made in Galashiels are of soft-spun yarn; the two fabrics being altogether different in their texture and appearance. The cloths manufactured have generally been of a coarse kind, but of late a finer species has been produced; indeed, broad cloths of the finest quality have been attempted, and with no inconsiderable success. By the use of foreign wool, the fannels of this place have risen to a degree of fineness surpassing any made in Scotland, and not much inferior to the best produced in the sister kingdom. A new manufacture, called Indiana, for ladies' gowns, has been introduced, and promises to be of great importance. The quality is so fine, that a lb. of wool yields a thread of more than 37 m. in length. (*New Stat. Acc. of Scot., & Galashiels.*) The shawls, when made of foreign wool, are exceedingly soft and elegant, as also what are called mufflers, or neckcloths, for gentlemen's use. The quantity of fabrics made of foreign wool has increased much of late years.

The number of manufactories in Galashiels are 12 employed, and 1 unemployed; the total number of spindles, 5,000; and, with the exception of three steam engines (of the aggregate power of 63 horses), the whole machinery is driven by water. (*Returning relating to Factories, Parl. Paper, Feb. 20, 1839.*)

The following is an average list of the work-people employed in 1833; their hours of working; and their wages. (*Stat. Acc. ut supra.*)

	Per Annum.	£	s.	d.
16 men (slubbers) and 80 children (from 8 to 14 years of age; pay 6d. per day), engaged by the year, and working 11 hours per day, receive	-	1,387	4	0
20 to 36 spinners, paid by the piece	-	1,092	8	0
100 weavers, paid as above	-	2,806	0	0
60 dyers and dressers, 10 hours a day	-	1,580	0	0
46 women, sorting wool and yarn	-	520	0	0

Total paid in wages - £7,150 12 0

This table, as we learn from respectable local authority, is nearly applicable at this date (1840); the chief difference being as to the children employed, none of whom, according to the act 3 and 4 Wm. IV. c. 38, can now be under nine years of age. The extension of machinery has also made some slight changes. The number of work-people in 1838 was 315.

Tanning of leather is also carried on to a considerable extent in Galashiel. There are two branch banks and a savings' bank. The town lies under serious disadvantages as to coal, which is the only sort of fuel in use; and which cannot be got at a less distance (Middleton) than 24 m. It is brought in carts; its price in the town ranges from 15s. to 21s. per ton. The markets of Galashiel have fallen into disuse, and its annual fairs are thinly attended.

Galashiel was erected into a bor. of barony in 1599, at which date its pop. was 400. But it is mentioned in history nearly three centuries before this date. (*Hailes' Annals, apud animum 1237.*) Galashiel was once a royal hunting station, and was used as such when the king came to the forest (Selkirkaire) to enjoy the pleasures of the chase. The tower, called "the kiel," a rudely built square edifice, of two stories high, in which he resided, was demolished within the last 20 years. Gala-house, the residence of the feudal superior of the bor., is in its immediate vicinity. Abbotford, the celebrated residence of Sir Walter Scott, is not above a mile distant, being on the opposite side of the Tweed, in the parish of Melrose. Gala is celebrated in song, "the braw, braw lads o' Gala water;" as are also the Tweed, and its tributaries in this neighbourhood, the Eterick and Yarrow.

GALICIA and LodomERIA (KINGDOM OF), a prov. of the Austrians, forming the N.E. portion, between 47° 10' and 50° 30' N. lat. and 18° 30' and 26° 30' E. long. The name Galicia is derived from the Polish "Halicz," as Lodomeria is from "Wladimir," both being ancient principalities forming a part of the present province, which also includes the territories of Poland which fell to Austria in the various partitions of that country, and the Bukowina, ceded by the Turks in 1774. Galicia lies to the N. of the Carpathian Mountains, by which it is separated from Hungary; on the N.W. Galicia is separated from Prussia, the state of Cracow, and a part of the kingdom of Poland, by the Vistula; on the N. and N.E. it is open, and has no well defined boundary; the E. frontier towards Volhynia is formed by the little stream Podhorze, which falls into the Dniestr. A range of heights divides the Bukowina from the Turkish part of Moldavia. On the W., the little stream Biala, a tributary of the Vistula, forms the boundary towards Austrian Silesia.

Surface of the country.—Lying on the N. and E. fall of the Carpathians, from their summits to the great N. plain into which they subside, Galicia is mountainous in the S., hilly in the centre, and in the N., and most extensive portion, a continued plain. For an account of the Carpathians, see that article.

Rivers.—Galicia is most advantageously supplied with rivers suited both to the purposes of commerce and irrigation. The Vistula (Vesela), which rises in Silesia, and flows N. to Danzig, where it falls into the Baltic, enters the kingdom at Dzielica above Oswiecim, and forms the frontier as far as Zawychot, a short distance below its point of junction with the San. Blumenbach states the elevation of its bed above the level of the sea at its entrance into Galicia to be 747 ft., and at Cracow to be 549 ft. Notwithstanding this rapid fall, the Vistula is navigable from Oswiecim for barges, and at Cracow for larger vessels. In this part of its course the Vistula receives the Sola, Skawa, Dunajec, and San, the sources of which are in the northern Carpathian range. The San is the second river, of importance to Galicia from the length of its navigable course, which commences at Przemysl. The Bug, whose sources lie in the hills to the N. of Lemberg, leaves the kingdom before it becomes navigable. The sources of the Dniestr, which flows S.E. till it falls into the Black Sea, are situated in the Carpathians a little to the W. of those of the San. The course of the Dniestr is at first from E.W. to N.E., but at Koniaski it changes to a general S.E. direction, which it preserves until it leaves the kingdom. The Dniestr is navigable from Koniaski, within 36 m. of the San, where it is navigable; so that it would not be difficult, by uniting these rivers, to form a channel of communication between the Baltic on the one hand, and the Black Sea on the other, enabling the corn and other produce of the prov. to be sent to whichever offered the most profitable outlet. Several other important rivers, such as the Pruth and the Saczow, with the Sulsawa and the Moldawa, its tributaries, take their rise in the Bukowina, which, however, they leave before they attain any size.

Lakes.—If all the sheets of standing water which are denominated lakes be numbered, few countries can boast of so many as Galicia. Not only the plain at the feet of the hills, but the valleys that intersect the hilly

country, and the sheiry declivities of the granite masses of the Tatras, are full of small lakes. Some of the last mentioned are most picturesquely situated, and furnish water to fine cascades. The most elevated is the Black Lake, of about 40 acres in extent, on the north side of the Krivan.

Climate.—The climate of Galicia is, with the exception of the Bukowina, tolerably equal, and in winter is very cold. The greatest heat is +92° in summer, and the greatest cold is -22° of Fahrenheit, according to Blumenbach, who states the mean temperature of Lemberg to be +45°. In the Bukowina the climate is much milder, notwithstanding the mountainous nature of the country, and the mean temperature is several degrees higher, although not so high as at Vienna, which lies under nearly the same parallel of latitude as Czernowitz, the cap. of the Bukowina. The winds are violent, and thunder-storms, accompanied by hail and torrents of rain, are of frequent occurrence.

Soil.—The most generally fertile portion of the province is the hilly country which occupies its centre; the country rises towards the S., the summits of the mountains presenting the hill but bleak naked rocks. Towards the N. the fertility of the soil likewise diminishes as the hills subside into the sandy marshy plain. The valleys which intersect the hills are usually filled with swamps, of which such as are drained (and these are now the greater part) have a very fertile soil; but the richest portion of the province is that part of the valley of the Dniestr, which once formed a part of Podolia, including the circles of Stanislawow, Osorkaw, Kolomea, and part of Basesany. Some very fertile tracts are likewise found along the banks of the San.

Products.—The agricultural productions are the most important in point of value, although confined to the common grains and potatoes. Malze is only cultivated in the Bukowina. The forests are chiefly of fir; flax and hemp are grown in great abundance. Of minerals, iron is found all through the range of the Carpathians, although but little mining is carried on: gold and lead, with silver, in small quantities, copper near Posporzita in the Bukowina, zinc and sulphur; but none of these minerals occur in a quantity proportioned to the riches of the other provinces of the empire. Salt alone is found in extensive, and almost inexhaustible beds, which stretch all along the range of the Carpathians. Coals are found in many places; marble and alabaster of middling qualities, and quartz in great abundance, which is used for the manufacture of glass; rock crystal, agate, jasper, and inferior qualities of opal, occur in the mountains. But as the greater part of the secondary formations are covered by the immense bed of sand which forms the Polish plain, it is not easy to ascertain their exact nature, and what minerals they contain.

Political divisions, &c.—Galicia is composed, as we have seen, partly of Polish and partly of Turkish territories. In the W. parts the duchies of Cracow and Zaborz, though belonging, at the time of the partition, to the kingdom of Poland, were claimed as fiefs of the German empire, because anciently the Polish sovereigns occasionally did homage for these possessions. Between them and the San, a Polish race, the Masura, inhabit the hilly country, while the mostly level land beyond that river is tenanted by a Russian race, differing in language, manners, and appearance from their Polish, as well as from their Moldavian, neighbours in the Bukowina. The present division of the province is into 19 circles, whose extent and population were in 1837 as follows:—[See top of opposite page.]

The population of this province amounted, according to Blumenbach, in 1776, to 2,860,888; in 1818 it amounted, according to official reports, to 3,760,319, and in 1837 to 4,569,631, showing an annual increase within the twenty preceding years of .986 on 100 of the population. The rate of increase must, however, for ordinary years, be considered as much higher, for the ravages of the cholera, between 1831 and 1833, caused a serious diminution in the population, which the province did not recover until 1836.

The births, within the 20 years, from 1818 to 1837 inclusive, are officially given as follows. The specifications for some years are wanting.

Legitimate Males and Females.	Illegit. Males and Females.	Total Males.	Females.	Annual Average of Births.	Prop. of Legit. to Illegit.
2,408,955	943,797	1,75,077	1,778,610	182,894	15 to 1
Of these still-born		11,990	7,808	935	

The number of deaths within the same period was reported as follows. Kinds of death specified in the lists of mortality: Ordinary, 2,512,232; epidemic, 178,181; smallpox, 36,175; suicide, 2,375; hydrophobia, 289; murdered, 1,361; accident, 27,275; executed, 180. The total being 2,759,380, of which 1,266,467 were of males.

Military	-	-	-	-	-	81,471	-	81,471	-
Total	34,340	289	6,035	676,619	1,075,391	2,281,033	2,318,578	4,599,631	131

and 1,372,913 of females. The increase of population was thus in the twenty years 888,307 souls. The marriages within the same period were 41,380 annually. The male population is classified as follows for the year 1837:—

Clergy.	Nobles.	Civil Officers.	Tradesmen.	Peasants.	Children.	Undetermined.
4,511	32,190	4,966	2,076	549,807	1,082,178	763,095

The great number of nobles is explained by the fact of a double nobility existing in the greater part of the eastern circles, where the original inhabitants of Russian origin (Rusnaks) were obliged to submit to the Polish law, and their lands were bestowed upon the conquerors. The unlimited divisibility of estates contributed to the increase of the noble families in the fertile countries, of whom one fourth part is found in the circle of Sambor.

Occupations of the People.—Agriculture is the principal source of wealth in this province, a great portion of which is very fertile. The amount of cultivated land in 1837 was given as follows:—

Arable Land.	Vineyards.	Meadows.	Commons.	Forests.	Total.
Russ. Acres. 8,078,543	Acres. 42	Acres. 2,885,244	Acres. 8,523,032	Acres. 5,961,304	Acres. 16,839,267

The official estimate of the produce calculated for the land tax was:—

Wheat.	Rye.	Barley.	Oats.	Wine.	Hay.	Timber.
Imp. Qrs. 591,359	Imp. Qrs. 295,490	Imp. Qrs. 2,321,302	Imp. Qrs. 5,100,252	Gals. 2,878	Cwt. 27,968,400	Cub. toises 2,425,563

But these returns are, in all probability, as is usual in such estimates, much below the truth. Of late years improved systems of agriculture have been introduced on nearly all the estates of the larger landed proprietors, and beet-root sugar factories are generally diffused. The great growth of barley and oats is explained by their immense consumption in distilleries, as whisky and potatoes may be said to be the principal beverage and food of the peasantry. Neither the amount of potatoes nor of beet-root cultivated, is given in the official returns; which, in fact, is little to be regretted, as no dependence can be placed on them. Agriculture is extremely backward. Nothing can be worse managed than the small grounds attached to the peasants' cottages, and for which, besides a small rent in money, and the tithe of the produce, they give a certain number of days' labour to the landlord. This service is named "robot," and is often made a source of oppression, though proceeding from a fair system of contract originally, and which may be even useful in a country where there is no capital, and but little demand for the produce of the land. But, as the landlords assume the right of rejecting labour in unfavourable weather, and thus monopolising the days on which field work can be well done, the industry of the peasants is well nigh exterminated. This may be looked upon as the last remnant of the oppression formerly practised in Poland by the great lords upon their tenants, and which entailed ruin upon themselves and their nation. It is only due to the Austrian government to state that it has in every way ameliorated the situation of the peasants.

Cattle breeding has been very much improved of late years. Swiss and Tyrolean horned cattle, and merino sheep from Saxony and Silesia, have been introduced by improving proprietors, amongst whom Counts Al-

fred and Leo Potocki, Scarbeck, Mniseck, and Prince Sangusko, may be specified. We subjoin a comparative statement of the stocks of cattle in the years 1829 and 1837:—

Year.	Horses.	Bulls and Oxen.	Cows.	Mules and Ases.	Sheep.
1829	478,800	550,392	1,006,710	299	761,828
1837	521,385	548,217	1,490,516	373	1,241,667

This great increase in the number of sheep is principally occasioned by the low price of corn, for which there is little demand for exportation. In the article AUSTRIA we have shown, by the statement of market prices in various parts of the empire, that the price of wheat remains invariable, often for years together, at 14s. 6d. or 15s. per quarter. The native breeds of all kinds of cattle are very bad, or have degenerated; the horses are small, but capable of great endurance; and the cows give but little milk. Great quantities of horned cattle are annually imported from Moldavia, but are mostly driven through to the great market at Olmutz, which supplies Vienna. Calves and heifers are, however, also bought of the Moldavians, and fattened either in the fine marsh pastures, which are very numerous, or by stall-feeding, which is in general practised upon large farms, and which is always connected with distilling. Turnips and clover are commonly grown where farming is good. Stallions are kept by the government at 73 stations throughout the prov.

Division of Property.—Though large, the estates of the Gallician nobles are less extensive than those in other parts of Poland. According to the official returns, they were divided as follows in 1830:—

Estates belonging to the crown.	ditto belonging to foundations for religion and education.	ditto with manorial jurisdictions.	ditto without such.	Total of Galicia, ex. Bukowina.
37	14	2,927	524,787	527,195

The following is the official return of the total amount of labour and produce chargeable upon the peasant's holdings in the prov., etc. the Bukowina, not included in the return:—

Hand labour.	Days in the Year.
With a wagon and four horses	16,226,499
Do. and two do.	1,377,700
Do. and four oxen	5,921,132
Of which, only 544,061 days were redeemed in money.	6,886,923
Of the rent payable in produce, the following are the most remarkable items:—	
Oats	217,794 korets.
Hops	7,505 do.
Hens	451,583 head.
Capons	171,982 do.
Eggs	2,091,235
Hemp	12,270 lbs.
Spinning	2,885,262 shetles of yarn.
Beeswax	2,172 lbs.
Butter	11,170 kgs.

The lb. weight and the foot are the same with those of Austria, corn measure.
The korets is 122-89 Rrs = 3-5 Imp. bushels, liquid measure.
The garnits = 3-5 litres = '86 Imp. gallons.

Manufactures.—The manufacturing industry of the province is quite inconsiderable. After the distilleries already mentioned, and the breweries, both of which are united with farming on large estates, mining industry is the most considerable. Salt, which is found in a fossil state in the greatest abundance, is worked only on government account, and being a monopoly of the crown. The salt mines of Wieliczka (see art.) and Bochnia are celebrated for their wonderful extent. On the cessation of these mines to Austria, a stipulation was made in favour of the kingdom of Poland, to which

three mines furnish annually any quantity required, at 2 s. (4s.) per cwt. for rock salt, and the same price for 140 lbs. of boiled salt. A further contract on credit was made in 1831 for 11 years. The quantity of salt produced in Galicia in 1837 was as follows:—Wieliczka, 809,081 cwt.; Bochnia, 277,508 cwt.; from springs, 4,145 cwt.; total, 1,090,651 Austrian cwt. = 123 English lbs. The sulphur mines of Sworowice are the only mining undertakings on government account, and produced, in 1837, 31,549 cwt. The private mines produced in the same year—

Silver Marks.	Copper.	Lead.	Iron. Cwt. = 132 lb. English.	Litharge.
418	2,840	215	86,889	410

On the whole, mining may be said rather to decline than to increase. Flints for guns were formerly prepared in large quantities at Nispolow and Podgora, but this manufacture is now transferred to the territory of Cracow.

The manufacturing industry of Silesia has spread partially into the neighbouring parts of Galicia, and both woollen and cotton spinning-mills and factories are established in the circle of Wadowice. Glass is made in several parts of the province, but does not rival that of Bohemia in quality.

Trades.—If we deduct the distilleries, the number of mining establishments and factories is 165, being about a third part of the industrial establishments of the same kind in Bohemia, and one sixth of the number registered for Lombardy and Venice; the pop. in each of these three provinces exceeding 4,000,000. The total number of trades of all descriptions in 1837 was registered at 47,662, in which 27,052 apprentices and workmen were employed. A great deal of linen is, however, woven by the peasantry, who are not registered as workmen, and it is not unusual both for the peasants to pay a portion of their rent in linen, and for servants to receive linen in part payment of their wages. Salaries of halliffs and superior officers of large households are also in part paid in kind, and this is often the case with the allowances of the clergy, schoolmasters, and even of many civil officers employed by government.

Commerce.—The new roads from Brody to Biala, and that along the mountains through Dukla to Stanislawow, which unites with the high road from Lemberg to Czernowitz, have all been constructed since Galicia came under the Austrian sceptre, and have conferred the highest possible benefit on the country. From the fairs of Leipzig, Breslau, and Frankfurt on the Oder, manufactured goods from Western Europe, and colonial wares, are transported along these roads to the E. part of Europe, and a considerable traffic is kept up by their means with Odessa and the Black Sea. The fine navigable rivers which water Galicia are but little used, if we except the San and the Vistula, when the exportations from Danzig are sufficiently extensive to affect this part of the country.

The Dniestr is the only river concerning the navigation of which any details have been published: the *Vienna Gazette* states the traffic upon this river to have been as follows, in 1837, from Galicia to the sea:—

23 dached barges, 15 open barges, 2 barkis, 122 rafts, constructed with 9,045 ft., and 67 oak, trunks.

The whole were loaded with timber, laths, and charcoal.

The boats on the upper Vistula are small, carrying from 20 to 60 tons. On the San the Uldnow boats carry the lesser burdens. The Dunajec, Poprad, Wyloka, and Bug, are navigable for rafts, as are also the Pruth, Serech, and other rivers. The little river Strý, which falls into the Dniestr, is navigable for rafts for nearly 50 miles, and its valley offers a good pass across the Carpathians into Hungary, the distance from the Strý to the Theiss in Hungary, not exceeding 70 miles. Under the circumstances of the greater portion of the courses of the Vistula and Dniestr being in the power of foreign potentates, this cheap means of communication with the Danube and the Adriatic Sea ought not to be overlooked. The iron railway now in progress of being constructed between Vienna and Bochnia, promises to open a most advantageous line of communication between this province and the capital.

The entries at the custom-house of goods imported from, and exported to, foreign countries, in 1836 and 1837 were:—

Imports, 1836	Fl.	Exports, 1836	Fl.
1837	5,461,294	7,453,085	
	5,677,537	7,645,778	

The imports consist chiefly of cattle from Moldavia, and Turkish wares for inland consumption and for the transit trade from Odessa. Furs, hare-skins, wax, and honey are imported from the Russian provinces; the exports consist of corn, timber, linen, hemp and flax, salt, lime, and other articles. But the trade with the

other provinces of the empire is of more importance than the foreign trade, as it includes the colonial wares, wine, metals, and manufactured articles consumed by the inhabitants.

The pop. is nearly equally divided between the Rom. Cath. and United Greek Church. The professors of the various religious creeds were in 1837 as follows:—

R. Cath.	United Greek.	Schismatic Greek.	Luther- ans.	Calvin- ists.	Other Sects.	Jews.
2,001,083	1,990,376	240,561	32,803	2,391	1,644	229,104

The Rom. Catholics are chiefly the Polish inhabs. of the circles to the W. of the San: the Rusniak inhabs. of the E. circles profess the Greek creed, and have an archbishop at Lemberg and a bishop in Frzemysl. The Rom. Catholics have likewise an archbishop at Lemberg, under whom are the bishops of Tarnow and Frzemysl. Lemberg has likewise an Armenian archbishop. The Schismatic Greek Church, the professors of which are chiefly the Moldavian inhabs. of the Bukowina, have a bishop at Czernowitz. Galicia has 73 monasteries, with 306 priests and 285 alumni and lay brothers. In 15 monasteries there are 185 nuns. The parochial clergy are, for the 2,690 Cath. and Greek united parishes, 3,353; and the clergy of other confessions, for 322 parishes, 362 in number. The Jesuits have, for many years, conducted a college at Tarnopol.

Although the institutions for education have been much improved by the care of the Austrian government, yet Galicia is not as well organised in this respect as the W. provinces of the empire. The Greek clergy profess to educate the poor, and their number swells the list of elementary schools, but the lower classes may be said to be every where uneducated; though the Polish peasants are distinguished for quickness of talent, and goodness of disposition. The little instruction spread amongst the people is chiefly confined to the Jews, who, by promoting trade, may be said, at present, to represent the middle class, and who, though badly treated and much abused, are, in the present neglected condition of the lower orders, useful and almost indispensable both to the highest and the lowest classes. They are not only subject to a high property tax, but their religious rites, which are somewhat less circumscribed than in other countries in their celebration, are made a source of revenue to the crown. The meat killed by their butchers, and the lights with which they celebrate the sabbath, are both heavily taxed. In 1837 the number of educational institutions was,—

1 university (Lemberg)	-	1,321 scholars.
7 colleges	-	672 — (lycees).
13 grammar schools	-	5,661 — (gymnasies).
37 private schools	-	68 —
24 boarding schools	-	1,150 — (3 military, 1 clerical)
1,345 elementary schools	-	67,958 — { from a number of 518,725 children returns as able to attend school.

The Sunday-schools were 595 in number, attended by 29,080 children.

The charitable institutions consist of 17 hospitals, with (1837) 11,051 patients, besides 28 belonging to the military, which counted 35,396 patients; 1 mad-house; 1 founding hospital; and 269 alms-houses with 1,978 inmates. The 11 institutions for the relief of the poor, had 4,329 claimants in 1837.

In its government Galicia is placed on a similar footing to the German provinces and Bohemia. The seat of the highest authorities is at Lemberg (Polish *Lwow*), where the courts of justice, both civil and criminal, of last resort are stationed. For nobles, the Landrecht courts of Lemberg, Tarnow, Stanislawow, and Czernowitz, and for citizens, the magistracy of the larger towns, distribute justice; and the peasants are amenable to 2,568 manorial courts, of which 2,519 are held by the officers of landed proprietors, and 39 by the crown. Criminal courts are held at Lemberg, Wilmets, Sambor, Stanislawow, Rzesow, and Czernowitz. The Bukowina has no manorial courts, the judiciary power being solely vested in the crown.

The inland position of this province, which the partition of Poland cut off from its natural communication with the sea by means of the Vistula and the Dniestr, is the greatest impediment to its rapid advance in point of prosperity. A new opening for the exportation of its rich produce is looked forward to when the completion of the iron railway from Bochnia to Vienna shall take place. The land carriage traffic, to which allusion has been made above as being actively carried on between Odessa and Brody, shows how natural a line of trade might be established on the Dniestr between the countries of the N.E. portion of Europe and the Asiatic provinces of Turkey and Persia.

GALICIA, a prov. of Spain, situated at the N.W. extremity of that peninsula, lying between lat. 41° 55' and 43° 47' N., and between long. 7° 17' and 9° 14' W. It is bounded N. and W. by the Atlantic, S. by Portugal, and E. by the Spanish provs. of Leon and Asturias. Area, 15,860 sq. m.

Pop., according to Miliano, 1,795,200. The country is in general very mountainous, being intersected by the branches of the Asturian mountains, which separate at the Sierra de Peñamarela, and form three ranges running W. S. W. and S. S. W. through the prov. In this prov. there are numerous depressions or valleys in every direction, of which those inclining W. and S. W. are extensive and fertile, especially those of the Minho, Sil, and Ulla. The rivers, which follow the course of these valleys, and generally give them their names, are neither long nor important, except the Minho, which rises in the Sierra de Monodono, in the N. E. part of the prov., and flowing S., with numerous affluents by Lugo, receives the Sil from the mountains of Astorga, and then passing by Orense, Ribadavia and Tuy, enters the Atlantic in lat. $41^{\circ} 52' N.$, after a course of 166 m. The next in importance are the Tambre, running E. into the Bay of Noya, the Ulla running E. S. E. into the Bay of Arosa, and the Lima, which enters Portugal near Lindoso. The coast of Galicia, especially on the W. side, is abrupt and much indented, forming numerous capes and bays. Of the former, C. Ortegal and Finisterre are best known; of the latter the Bays of Ferrol, Betanzos, Coruña, Pontevedra, and Vigo, are the most extensive. The temperature varies greatly; in the N. and among the mountains, cold, damp, and rainy; warm and moist on the coast; but warm, dry, and genial in the S. W. part of the prov. Although fog and moisture prevail more here than in most other parts of Spain, the climate is not unhealthy, and the people are robust, and capable of heavy and continuous labour. The high lands produce abundance of good forest timber, adapted for ship-building. There is good pasture for cattle, sheep, and horses, which are kept in small quantities by even the lowest classes of the rural population, and sold at monthly fairs for removal to other parts of Spain. The produce of the valleys consists of wine, maize, wheat, barley, flax, and potatoes, a part of which are shipped off to Alicante, Malaga, and Barcelona. The sweet chestnut grows abundantly, and may be justly called the bread of the Galicians, as it constitutes their common and favourite food. The mineral productions consist of copper, lead, antimony, and tin; white marble and Jasper are found in the mountains of the N. part. There are several mineral springs; one is at Orense. Along the coast are anchovy fisheries, chiefly conducted by Catalonians.

The pop. is principally agricultural, and landed property is usually divided into small possessions, so that there are few rich proprietors, but many occupiers tilling their own land and rearing their small stocks of cattle. Manufactures are but little followed, coarse woollens, linens, and sail-cloth being the only articles produced. The Galicians, or *Gallegos*, are a quiet, simple, hospitable, and industrious people; grave, and timorous; worthy; the men are hardy, and patient under fatigue or privation; the women are dark, but handsome, cheerful, and fond of singing their national airs. Like the Swiss, they leave their country in great numbers, sometimes 90,000 in a year, to seek employment in other parts of Spain and Portugal, where labour is better rewarded. The best servants in Madrid and other principal towns come from Galicia, and they are preferred for fidelity and obedience; and the porters and water-carriers of Madrid, Lisbon, and Seville, are usually natives of this prov. Indeed, so much more effective are the Galicians in getting in the harvest and vineages than the Castilian and Portuguese peasants, that a failure is considered as a necessary consequence of their absence from the work. They make also the best soldiers in the Spanish army. The language spoken in this prov. is the old Castilian (which much resembles Portuguese) mixed with low Latin.

Galicia is divided into 7 provs., and subdivided into 666 jurisdictions. Principal towns, St. Iago, the cap., Coruña, and Orense. The whole is governed by 28 magistrates. The ecclesiastical discipline is conducted by an archbishop and four bishops.

The Calalai, a canton of this district, were first conquered by Decimus Julius Brutus, and wholly subjugated by Augustus, who divided the country in the prov. of *Terraconensis*. The Visigoths took the country from the Romans, and were in their turn driven from it by the Moors. The princes of Asturias retook it from the Moors, and annexed it to their kingdom, which was united with Castile in 1039. (*Miliano*.)

GALL (ST.), a canton of Switzerland, in the E. part of which it is situated, occupying the 14th place in the Swiss confederation. It has E. a portion of the Austrian dom. (the Vorarlberg), from which it is separated by the Rhine; S. E. and S. the Grisons; W. the cantons Glarus, Schwyz, and Zürich, with its lake; and N. Thurgau, and the Lake of Constance. Length, N. to S. about 40 m.; breadth varying from 11 to nearly 35 m. Area, 747 sq. m. Pop. (1838) 156,833. Surface greatly diversified: in the N. there is an inconsiderable portion of plain country, but the central and S. parts are almost wholly covered with Alpine ranges, the summits of

some of which rise above the limit of perpetual snow. Mount Scheide, at the S. W. extremity, is estimated to be 10,188 ft. above the level of the sea, and Kameckberg 7,614 ft.; the Speer, a mountain near the centre of the canton, is 6,906 ft. in elevation. (*Bruggs, Orographic*.) There are, however, several extensive and fertile valleys, as that of Toggenburg, watered by the Thur, 36 m. in length, those of the Rhine, &c.; and others noted for their wild and picturesque character. Next to the Rhine, the chief rivers are the Thur, Sitter, Serz, and Tamina; all, except the last, have generally a N. W. direction. The principal lake is that of Wallenstadt, mostly comprised within this cant. The plains and valleys are in many parts well cultivated; but the corn produced is insufficient for home consumption. Potatoes are extensively grown. Fruit is largely cultivated, especially in the N. Cider is the ordinary drink of the people; and in the mountainous parts of the country a good deal of *kirchenswasser* is made. There are vineyards in many of the districts, in which a red wine is made; and the wine of Bouchberg, in the valley of the Rhine, is esteemed the best of German Switzerland. But the principal branch of rural industry is the rearing of cattle. Artificial meadows are well kept in the mountainous parts, but not generally so in the lower parts of the country. The number of horned cattle is very great; and in the S. there are many sheep, goats, and pigs. Every spring considerable flocks of sheep are bodged in the Grisons, kept during the summer in St. Gall, and sold in the autumn. Dairy husbandry is not so well attended to in this as in many other cantons; but though the cheese be of an inferior quality, the butter is superior. The forests in the S. are extensive, consisting principally of pine and fir, with some beech trees, and a few oaks. But, at present, the forests are almost useless; since, from the want of roads, and the mountainous nature of the country, it is in most places very difficult to bring the timber to market. There are some iron-mines near Sargans, and coal and turf are met with elsewhere. Mineral springs are numerous; amongst them are the celebrated bath of the Töflers in the S. (*Bruggs*.) St. Gall is one of the principal Swiss manufacturing cantons; as many as 60,000 of its inhab. being supposed to be employed in its manufactures. These are chiefly of cotton fabrics and thread, especially muslins, and linen cloth, which was formerly the principal. Muslins of extreme fineness are woven in large quantities in the town of St. Gall, and are embroidered by the women in most of the districts. Cotton thread is spun mostly in the S., but also in the valley of Toggenburg, where many cotton handkerchiefs and other fabrics are made. There are some good cloth bleaching establishments at St. Gall, Rorschach, &c., and a few glass and wax-bleaching factories; but the manufactures of the canton have generally diminished since the peace. External commerce is chiefly confined to the import of corn and other provisions, and of raw materials for the manufactures; and to the export of manufactured goods, raw hides, and cattle. The transit trade is inconsiderable, except on the Wallenstadt lake and Linth canal, which form part of the main channel of communication between Zürich and Italy. St. Gall is divided into eight districts, and has no town, St. Gall, the cap., excepted, with 2,000 inhab. The government is one of the most democratic in Switzerland. It is composed of a grand and a petty council: the first consists of 150 members (84 Rom. Cath. and 66 Protestants) chosen in the different circles and communes by the suffrage of those citizens above 21 years of age who are neither bankrupt, receiving aid from public charities, nor against whom a criminal judgment has been pronounced; and who pay taxes on property to the amount of 200 Swiss francs. In 1821, 32,980 citizens were entitled to vote. Members of the grand council must be above 30 years of age; they are elected for three years, but are always re-eligible. The petty council, which has the executive power, consists of nine members, chosen from amongst the grand council, each of whom must pay taxes on property to the amount of 6,000 fr. The grand council passes or rejects laws proposed to it by the petty council; has the superintendence of all the state accounts; appoints all public functionaries, and fixes their salaries; exercises the right of granting pardons; and nominates the president of the petty council, as well as its own, who are called *landammans*, one being a Catholic and the other a Protestant, and who alternately preside in either assembly for a year. The people at large have, however, the privilege of a *seco* on any law passed by the councils, if that privilege be exerted within 45 days from the time of its passing. Each commune has a council, composed of from 4 to 12 members, and a syndic, to which the local administration is confided. Members must be 25 years of age, and pay taxes on property of 50 fr. value. There are communal and district judicial courts, and appeal from the latter to a supreme court in the cap., consisting of 12 judges, whose qualifications are similar to those of members of the petty council. The total pop. consists of

about 100,000 Catholics and 55,000 Protestants: the latter reside chiefly in the cap., and the valleys of Toggenburg and the Rhine. They exhibit more activity and intelligence than the Catholics; but the greatest harmony exists between the two persuasions, and in the various public schools teachers belonging to either are indiscriminately employed. Education was till lately very backward, but primary and secondary schools are now established in every district. There are some high schools in the cap. German is the language of the cant. St. Gall furnishes a contingent of 2,630 men to the army, and 30,450 Swiss fr. to the treasury of the Swiss confederation. Public revenue (1835), 305,357 florins; expenditure, 274,004 fl. This canton was first formed in 1798, by the union of the territories of the city and abbey of St. Gall with those of other districts, previously subject to the Swiss confederation, and administered by bailiffs.

GALL (ST.), a town of Switzerland, cap. of the above cant., on the Steinach, in a narrow and elevated valley, 64 m. S.W. the Lake of Constance, and 39 m. E. by N. Zürich; lat. 47° 35' 40" N., long. 9° 22' 15" E. Pop. (1838) 10,500. It is surrounded by old walls and a dry ditch, now converted into gardens; and has three suburbs. It is well built, and has broad streets, the remains of a celebrated abbey, 6 churches, an arsenal, hospital, orphan asylum, a Catholic gymnasium with 11 professors, a Protestant college with 14; many learned and benevolent societies, public and private libraries, collections of natural history, and a casino or public reading-room. A magnificent abbey was erected over the tomb of a monk, called Gallus, said to have belonged at one time to St. Gall, under the auspices of Pepin l'Heristal. This abbey was one of the oldest ecclesiastical establishments in Germany. It became the asylum of learning during the dark ages, and was one of the most celebrated schools in Europe between the 8th and 10th centuries. Here the works of the authors of Rome and Greece were not only read but copied, and we owe to the labour of these obscure monks some of the most valuable classical authors; Quintilian, Petronius Arbiter, Silius Italicus, and Valerius Flaccus have been printed from MSS. found here in 1413. Several of its most valuable MSS. having been lent to the dignitaries attending the Council of Constance, were not returned; but it still contains, or, at all events, did contain when it was visited by Mr. Coxe, a collection of letters, in 13 volumes folio, by the most distinguished German and Swiss reformers. The library, which now belongs to the town, occupies a fine apartment; and, besides its literary treasures, has some busts, portraits, and a cabinet of mineralogy. The abbey church is now the cathedral of the diocese of St. Gall and Appenzell; the ancient palace of the abbots (*die Pfalz*) at present serves for the public offices of the cantonal government; and the other buildings of the monastery have been appropriated to the Catholic gymnasium. The abbey was secularised after the French revolution, and in 1806 its revenues were sequestered.

St. Gall is one of the chief manufacturing towns of Switzerland. It has extensive manufactures of muslin; is the centre of the Swiss trade in that article, and of embroidery in gold and silver; and a general depot for the merchandise of the cantons of St. Gall, Appenzell, and Thurgau. Other cotton, flax, and yarn are also produced, the spinning of the latter employing several factories. In the suburbs there are a great many bleaching establishments. Some pretty extensive banking operations are transacted in the town. A market is held every Saturday, and 2 fairs of 5 days each take place twice a year. The inhab. are generally active and prosperous; about 7-8ths of them are Protestants. House-rent and living are exceedingly cheap. About 3 m. S.W. St. Gall is the fine bridge over the Sitter, called the *Brückenbrücke*, 590 ft. long, and 85 ft. above the surface of the river.

The abbots of St. Gall about the 10th century began to assume a military character, and surrounded the convent with walls and ditches. From the 13th century they enlarged their dominions at the expense of their neighbours, till they became the most considerable territorial sovereigns in N. Switzerland, and were raised to the rank of princes of the empire. Early in the 15th century, however, Appenzell threw off their yoke, and at the Reformation the town of St. Gall emancipated itself from their control, and acquired a territory of its own. The town was first incorporated in the 10th century: in 1454 it allied itself with the free Swiss cantons, and sent a deputy to the diet; and at the end of the 17th century, its civil and political independence was secured. (*Flora Helvetica de la Suisse*, pp. 398-405; *Lex. Geogr. and Statist. de Switzerland*; *Historie Altkantons*; *Cant. de Switzerland*, letter iv.)

GALLIPOLI (an. *Callipolis*), a sea-port town of S. Italy, kingd. Naples, prov. Otranto, cap. distr. and cant., on a rocky islet on the E. coast of the Gulf of Tarento, 40 m. S.E. Tarento, and 38 m. W.S.W. Otranto; lat. 40° 27' N., long. 18° 58' E. Pop. 5,550. A bridge unites it with the mainland, on which is its suburb Lissa.

Gallipoli is fortified, and has a castle, bombarded by the English in 1812. It is well built, and has a good cathedral, several churches and convents, a seminary, and some other public schools. About 1 m. W. from the town is the island of Andros, on which is a lighthouse; and between it and Gallipoli there are from 9 to 10 and 13 fathoms water: but vessels of considerable burden must not come within gunshot of the city. Gallipoli displays an air of great industry, if not of affluence. It is the most frequented of all the sea-ports on the S.E. coast of Naples; and the great mart for the oil of Apulia, most of which is shipped here, it being peculiarly well adapted to serve as a depot for oil. "The rock (limestone) on which the town is built is easily excavated; and in caverns thus constructed oil clarifies sooner, and keeps without rancidity much longer than in any other place. Hence numerous oil-houses are established at Gallipoli, and a very considerable portion of the rock is cut into cisterns. A Gallipolitan oil-warehouse generally occupies the ground-floor of a dwelling-house, and has a low arched roof. Some are more extensive; but, on an average, they are about 80 ft. square. In the stone floor you see 4, 6, or more holes, which are circular, about 3 ft. in diameter, and like the mouths of wells. Each of these holes gives access to a separate cistern beneath your feet; and when the oil is poured into them, care is taken not to mix different qualities, or oils at different stages, in the same reservoir. One cistern is set apart for *oglio nuovo*, or oil that is not clarified; another for pure oil of the season; and another for old oil, &c. I have seen oil that had thus been preserved for 7 or 8 years in a perfect state, or, as the Gallipoli merchants have it, *chiero, giallo e lampante*. I also many times verified the fact that the *mosto*, or oil in its turbid state, which arrived almost as black and thick as pitch, soon became bright and yellow in these excellent reservoirs, without any help from man.... When the oil is to be shipped, it is drawn off the cistern into *uteri* or skins, and so carried on men's shoulders down to a small house, on the sea-shore. In that house there is a large open basin capable of containing a given quantity, and of measuring the oil, and into that the porters empty their skins as they arrive. A tube communicates from the basin to a large cask on the outside of the house. When the basin is full, well-made casks of various sizes, for the convenience of stowage, are placed under the cask, which is then turned, and the casks are filled. As the casks are closed up by the cooper, the porters roll them down to the brink of the sea, where the sailors secure several of them together with a rope, and taking the end of the cord into the boat, they row off to the vessel, towing the oil-casks through the water after them." (From the volume in the *Library of Entertaining Knowledge*, entitled *Travels in Sicily and the Materials of Manufactures*.) Gallipoli has also manufactures of muslin, cotton stockings, and woollen goods; considerable trade in corn, wine, fruit, &c.; and a productive tunny-fishery. It is said to have been originally founded by colonists from Lacedæmon. It suffered greatly at the hands of Charles II. of Naples, the Venetians, and the Turks; but the Emperor Charles V. improved its fortifications, and restored to it a considerable share of prosperity. (*Swinsburne*; *Cruces*; *Rampoldi*, &c.)

GALPOIT (an. *Callipolis*), a sea-port town of Turkey in Europe, prov. Roumelia, cap. sanjak and distr., on a headland called the *Braccio di Gallipoli*, at the point where the Hellespont unites with the sea of Marmara, 90 miles S. Adrianople, and 136 miles W. by S. Constantinople; lat. 40° 34' 30" N., long. 26° 39' 45" E. Pop. 17,000. It was once fortified, but is now destitute of walls; its only defence being, in the words of Tournefort, "a sorry square castle, with an old tower, doubtless that of Bajazet." The town consists of miserable houses and dirty streets, intermixed with gardens. The barracks, however, are extensive and well-furnished. There are two ports, a N. and a S., which frequently harbour the imperial fleets. Gallipoli being the chief station of the capitan-pasha. It is also the see of a Greek bishop; and has manufactures of cottons, silk, earthenware, and the best Morocco leather made in Turkey. A few remains of antiquity are in good preservation, and fragments of sculpture and architecture are seen in every part of the town. When Sir J. Hobhouse visited Gallipoli in 1809, half its inhab. were Turks, and the remainder Greeks and Jews. The great number of Turkish tombs in its vicinity prove it to have been a favourite place of residence with the Turks. A little corn is grown in its neighbourhood, but not enough for 1-4th part of the pop. Gallipoli was the first European town which fell into the hands of the Turks. They took it in 1357, on which occasion the emperor John Paleologus observed, that he had only lost a jar of wine, and a sty for hogs, alluding to the magazines and cellars built by Justinian. Bajazet I., however, knowing its importance for passing from Prusa to Adrianople, had it repaired and strengthened, and its port improved. (*Thornburi*; *Hobhouse*, let. xliii.)

GALLOWAY, a distr. in the S. of Scotland, comprising the co. of Wigton and Kirkcudbright. Its dimensions were at one time much more extensive; but for a lengthened period it has been restricted as above.

GALLOWAY (MULL OF), a promontory of Scotland, co. Wigton, comprising the S. portion of the distr. called the Rhinns. It stretches in a S.E. direction from Portpatrick to the Point of the Mull, about 17 m.; its breadth varies from about 2 to about 5 m. The Point of the Mull, the farthest S. limit of Scotland, in lat. 54° 38' N., long. 4° 52' W., rises about 255 feet above the level of the sea, and is bold, bleak, and striking. A lighthouse of the first class, with an intermittent light, having the lantern elevated 325 feet above the level of the sea, has been erected on this headland. The view from the balcony of the lighthouse is very extensive, commanding the whole Isle of Man, the coast of Cumberland and the Cumberland mountains; a great part of the coast with the mountains of Dumfriesshire and Galloway, the Paps of Jura, and the coast of Ireland, from Fairhead to the Mourne mountains.

GALLOWAY (NEW), a royal and parl. bor. of Scotland, on an acclivity, on the W. bank of the Ken, nearly in the centre of the S. of Kirkcudbright, on the road from Kirkcudbright to Ayrshire by Dalry and Dalmellington, 17 m. N.W. Kirkcudbright. Pop. 460. Though finely and romantically situated, it is a poor mean place, the site of the important ruins of Kenmure Castle, the residence of the viscounts Kenmure, within 1 m. of the bor., stands on a conical mound at the head of Loch Ken, through which the river of the same name flows. The song "Kenmure's on and awa," refers to the viscount Kenmure who was beheaded for rebellion in 1715. In the bor. or neighbourhood were born Thomas Gordon, author of *Cato's Letters*, the *Independent Whig*, &c., and translator of Sallust and Tacitus; John Lowe, author of *Mary's Dream*; and Robert Heron, author of a *History of Scotland*, in 5 vols., and various other works.

New Galloway was erected into a royal burgh in 1633. It unites with Stranraer, Wigton, and Whitthorn in sending 1 mem. to the H. of C. Registered voters, in 1839-40, 17. (*Murray's Literary Hist. of Galloway*, 2d edition, pp. 179, 219, 269.)

GALWAY, a mar. co. on the W. coast of Ireland, prov. Connaught, having S. Galway Bay and the co. Clare and Tipperary; E. King's County and Roscommon; N. the later and Mayo; and W. the Atlantic Ocean. Area, 1,510,529 acres, of which 476,997 are mountain and bog, and 77,922 water, principally consisting of Lough Corrib and Mask. The coast of the co. is deeply indented in its W. and S.W. portions by numerous bays and arms of the sea, affording fine but neglected asylums for shipping, and good, but also neglected, fishing stations. Climate mild, but humid. The co. presents every variety of surface and soil: the country lying to the W. of Loughs Corrib and Mask, including the districts of Connemara, Jarconnaught, and Joyce's Country, being one of the most rugged and wildest portions of Ireland. The other portion of the co., or the whole lying to the E. of way town and of the above-mentioned lakes, is comparatively flat and fertile. After the Shannon, which bounds the co. on the S.E., the most considerable rivers are the Suck and the Black River. Agriculture is very backward. A great extension of tillage has taken place of late years; but it is doubtful whether this be any improvement, and whether it be not wholly ascribable to the improvident breaking up of old pasture land. Principal crops, oats and potatoes; but a good deal of wheat is now also raised. Estates mostly very large. Tillage farms mostly very small, and very generally let on the village or partnership system, which is destructive alike of agriculture and of the interests of the occupiers. A good deal of work is performed by the loy or spade. Excellent long-horned cattle are met with in this co., which, indeed, is much better fitted for grazing than for tillage. Average rent of land, 12s. 1d. an acre. The farm-houses and cottages are, generally speaking, wretched in the extreme; and the cottiers are quite as badly off as in most other parts of Ireland. Manufactures can hardly be said to exist; and, with the exception of limestone and marbles, the minerals are of no importance. In many districts the Irish language is in all but universal use. Galway is the only considerable town. The co. is divided into 16 baronies and 116 parishes, and returns 4 mems. to the H. of C., viz. 2 for the co., and 2 for the bor. of Galway. Registered electors for the co., 1838-39, 2,074. In 1831, Galway (inc. town) had 67,114 inhab. houses, 72,224 families, and 414,684 inhab., of whom 204,691 were males, and 209,993 females.

GALWAY, a town and sea-port of Ireland, on its W. coast, prov. Connaught: it is a co. of itself, but is locally situated in the above co. on both sides the river flowing from Lough Corrib to the sea, at its mouth, and at the N.E. extremity of Galway Bay, 113 m. W. Dublin; lat. 53° 28' 30" N., long. 9° 13' W. The co. of the town, extends over a space of 23,000 acres, and had in 1831 a pop. of 33,120, of whom 21,467 were resident in the town, and 11,653 in the

country; 32,117 being, at the same time, R. Cath., and 1,003 Protestants, including 81 Presbyterians. Galway, from a remote period, has been a place of considerable importance, both as a military station and a commercial mart. It underwent various vicissitudes during the civil war of 1691, when it was taken by the parliamentary army, and in that of 1688, when it surrendered to the forces of King William. The town is situated principally on the E. side of the river: that portion of it which was included within the old walls is built chiefly in the Spanish fashion, the houses being of stone, in a quadrangular form, with an open area in the centre, to which the entrances from the street are through arched gateways. In this part the streets are narrow, ill paved, and dirty. The river is crossed by two bridges, one built in 1343, and still in excellent condition, the other of modern construction. The walls were taken down in the beginning of last century, with the exception of the N. bastion, which has been preserved in its original state. The New Town, E. from the Old Town, built according to the modern fashion, contains a square and several wide streets. The extensive suburb of Claddagh, inhabited exclusively by fishermen, lies on the W. side of the river. The town, with the surrounding district, comprising the parish of St. Nicholas and seven others in the vicinity, constitutes the wardenahip of Galway, a separate ecclesiastical jurisdiction exempted from that of the bishop, and subject to the archbishop of Tuam in a nominal visitation. According to the R. Cath. arrangements, the town is the head of the newly erected see of Galway, comprising 12 parishes. The parish church of St. Nicholas is a large and venerable cruciform structure in the pointed Gothic style, of considerable antiquity, having been founded in 1320. The R. Cath. chapel of the same parish, which is also the bishop's cathedral, is a spacious modern edifice. The Franciscans, Dominicans, and Augustines, have monasteries here, to each of which a chapel is attached, as is one to the nuns of the order of the Presentation. Protestants have also a meeting-house. Near the E. extremity of the town is a classical school, on the endowment of Erasmus Smith; there is also a large parochial school for boys and another for girls, under the care of the nuns of the Presentation, and several private schools, in all which about 700 children receive instruction. The Amicable and Commercial Societies, each of which has a reading-room for newspapers and other periodical publications, are the only literary institutions: two newspapers are published in the town. The charitable establishments are the house of industry, a friendly visitation, the Protestant poor-house, the widows' and orphans' asylum, and the Magdalen asylum. There are two barracks, capable together of accommodating 600 men.

The corporation, which holds its rights from a charter of Charles II. in 1673, consists of a mayor, two sheriffs, a recorder, and an indefinite number of burgesses and freemen. The mayor and recorder are justices of the peace for the co. at large, as well as for that of the town, and there are 8 other magistrates. A court of record for pleas to any amount is held on Mondays and Fridays. The assizes, both for the co. and the town, are held here, as are the general sessions of the peace for the co., in April and October, and those for the town 4 times a year. The bor. sent 4 mems. to the Irish H. of C., and 1 to the Imperial H. of C., down to the passing of the Reform Bill, which conferred on it the privilege of sending 2 mems. The parl. bor. includes the entire co. of the town, and had, in 1828-9, 2,064 registered electors. The court-houses for the co. and for the town are elegant buildings of modern construction. The co. prison, a handsome building in the form of a crescent, has only 33 sleeping cells for an average number of 160 prisoners: that of the town, which has been lately much improved, has 33 cells for an average of 35. A tread-mill in the former of these is used to work machinery for turning and polishing marble, and for sawing wood.

Galway is not a manufacturing town. The linen manufacture was attempted, but failed. Its trade at present consists almost exclusively in the export of agricultural produce, fish, kelp, and marble. It has several flour-mills, a foundry, a brewery, and 2 distilleries. The salmon fishery is valuable; the fishery of cod, hake, haddock, &c. is less valuable than it might be, in consequence of the poverty of those engaged in it, and their pertinacious adherence to rules devised by themselves for the exclusion of strangers from the business. The progress of Galway has been checked by the insufficiency of its harbour, which dries at low water, so that vessels of any considerable burden were obliged to anchor between the town and Mutton Island, where they are exposed to the S.W. gales. To obviate these defects, an extensive dock has been constructed at Galway, which admits vessels drawing 14 ft. water, and is of the greatest advantage to the trade of the town and of the surrounding district. A lighthouse has been erected on Mutton Island; and it would be easy, by running out a breakwater of two cables' length from the S. end of this island, to make an excellent roadstead. We subjoin an

account of the quantity and value of the exports from Galway in 1835:—

Articles.	Quantity.	Estimated Value.
<i>Exported.</i>	<i>Number.</i>	<i>£.</i>
Wool	515	263
Corn, meal, and flour	1,195,573	217,519
Bees and honey	34,000	50,000
Fine salt tow	60	150
Woolen and half-woolen	1,500	1,000
Other articles	Value	2,418
		251,864

The gross customs' duty collected at Galway in 1839 amounted to 25,068*l*. Post-office revenue, in 1830, 2,498*l*.; in 1836, 2,707*l*. In 1836, 572,198 galls. of spirits were produced in the town, on which duty was paid to the extent of 43,540*l*. Branches of the Prov. Nat., and Agric. Banks have been established at Galway. Markets are held on Wed. for corn, and on Sat. for corn, provisions, and live cattle, chiefly pigs. Fairs on May 31. and Sept. 21.

Until of late years, Galway had but little connection, owing to the want of roads, with the extensive country W. from it. This defect is now, however, in a great measure obviated by the carrying of roads into Connemara, Joyce's Country, and other wild districts, affording an easy transit for their produce to Galway.

The inhabs. of the Clough suburb constitute a separate community; their number is from 5,000 to 5,500, and they are ex-clusively fishermen that their cottages have scarcely even a potato-garden attached to them. The community is governed by a mayor, elected by themselves, whose authority is so highly respected that appeals from his decisions to the constituted authorities are almost unknown. Their dress is comfortable and substantial, but of a peculiar make. When at home, the men are wholly unemployed. They leave the entire superintendence of their pecuniary affairs to the women, who receive the cargoes of fish on the arrival of the boats, dispose of the produce, and supply the male part of their families with washing, food, and spirits. The men indulge in whiskey; but riots or tumults originating in excess are notwith-standing infrequent, and when they go to sea, which they do in a body, commanded by a leader to regulate their movements, they strictly prohibit any whiskey being brought aboard their boats. Their strong religious feeling is evinced by the erection of a large chapel out of their earnings, and by the liberality of their contributions to the support of its officiating clergymen; as also from the custom, undeviatingly adhered to, of having a prayer offered up by a clergyman, according to a specified form, previously to the sailing of their fleet of fishing craft. In 1836 there belonged to the village 105 open sail boats, and 80 row boats navigated by 820 hands. Still, however, as already stated, their exclusion of strangers from all participation in the fishery, their poverty, and their adherence to routine practices, oppose all but invincible obstacles to the extension of what might otherwise be an advantageous source of employment. (*Railway Report, &c.; Private Information.*)

GANDIA, a town of Spain, Valencia, distr. Denia, in a plain 24 m. S.S.E. Valencia. Pop. 6,049. (*Milano*, 1836.) It is an agreeable town, and is noted for the industry of its inhabitants. It has a large and fine collegiate church, convent, college, cavalry barracks, and a palace of the duke of Gandia. It is in the centre of one of the best cultivated districts of Spain.

GANGES, the principal river, or, as it has been expressively termed, the Nile, of Hindostan, through the N. and E. parts of which it flows, watering its most fertile regions, and extending through 18 degrees of long. and nearly 10 degrees of lat. from the central chain of the Himalaya to the Bay of Bengal. Its course is almost wholly comprised within the British presidencies of Bengal and Bihar. It rises in two principal heads, the Bhagirathi and Alencanda, about lat. 21° N. and between long. 79° and 80° E. The Bhagirathi, or W. branch, though neither the longest nor largest, is considered by the Hindus as the "true Ganges." It issues about 13 m. above Gangourat, and 200 m. N.N.W. Delhi, from under a low arch called the "Cow's Mouth," at the base of a mass of frozen snow, about 13,800 ft. above the level of the sea; with a mean breadth of 37 ft., and a medium depth of 14 inches. It forms a junction with the Alencanda at Deopur, about 9 m. S.W. Serinagar; lat. 30° 30' N., long. 78° 30' E. The resulting stream, with a width of about 60 yards, assumes the name of the Ganges; and at Hurdwar enters the great plain of Hindostan at an elevation of only 1,034 ft. above the sea. It flows thence, with a smooth navigable stream, to the ocean, a distance of about 1,350 m., diffusing abundance on all sides by its waters its produce, and the facilities it affords for intercommunication. As far as Hurdwar its course is mostly S. 20° E.; thence to its confluence with the Jumna, in lat. 26° 30', long. 81° 10', it runs generally S.E.; from

Allahabad to Rajmahal its course is mostly E.; and it then turns S.E., and lastly S., till it enters the Bay of Bengal, by numerous mouths, between lat. 22° and 21° 30' N., and long. 89° and 90° 40' E. Its entire course may be about 1,500 m. The chief tributaries of the Ganges are the Jumna, Ramganga, Gomty, Goggra, Sone, Ghinduck, Coli, Mahamunda, Teesta, &c. They vary in length from 200 to 600 m.; and, except the Sone, flow towards the Ganges from the N.

About 200 m. from the sea, the Delta of the Ganges (which is twice as large as that of the Nile), begins to be formed. Of its two principal arms, which form the outermost of the whole series, the E. is the larger, and preserves the original direction of the main stream, together with the name of the Ganges; but the W. arm, or Cosimbazar branch, called afterwards the Hooghly, is considered by the natives the true Bhagirathi, and invested by them with the greatest portion of sanctity. The whole of the delta between the two principal arms is a vast alluvial fan nearly 200 m. in width, intersected by numerous rivers interlacing each other in all directions, and which enter the sea by from 12 to 20 mouths. The region round the mouths of the Ganges, termed the Sunderbunds, is a pestiferous tract, covered with jungle, and swarming with tigers and other beasts of prey.

Between Hurdwar and Allahabad the course of the Ganges is tolerably straight, the breadth of its bed generally being from 1 to 1½ m. Thenceforward it winds more; and having received the Goggra, Sone, and Gunduck, attains its greatest magnitude. For the last 600 m. of its course its bed varies from ½ m. to 3 m. in width, and at the lowest season the mean breadth of its channel is about 2-4ths of a m. Above its confluence with the Jumna it is sometimes fordable; below that confluence it is generally of considerable depth, for the additional streams bring a greater accession of depth than width. At 500 m. from the sea the Ganges is 30 ft. deep, and it continues of that depth, at the least, till it approaches very near its mouth. The rate of descent from Hurdwar to the sea averages about 9 inches a m., but nearly 2-3ds of the entire fall takes place before reaching Cawnpore. The mean rate of the current in the dry month is less than 3 m. an hour; but in the wet season it is often from 5 to 6 m., and in particular situations from 7 to 8 m. The banks of the Ganges are commonly precipitous on the side on which the current impinges, and shelving on the other side. The force of the stream, when the river is at its height, sometimes breaks down the banks, which are composed of a loose and yielding soil, with such rapidity that an acre of land has been seen to disappear in less than half an hour! From the great quantity of mud brought down by the river in the latter season, and other causes, its mouths are encumbered with bars and shoals. The Hooghly is less so than the E. arm, but no ship drawing more than 15 ft. water can navigate the latter with safety; and the E. I. C.'s ships, that were usually from 1,000 to 1,200 tons burden, and drew above 22 ft. water, loaded and unloaded at Saugor Island. (*Crawford's Memo. to Stam, &c.* 1.3.) The Cosimbazar branch, also, is almost dry from Oct. to May; and the Chundna, which enters the sea by the Hooringottah mouth, is the only branch that is at all times navigable.

The annual inundation of the Ganges is owing chiefly to the tropical rains. These prevail successively throughout all the countries through which the Ganges flows; and in this respect its inundation differs from that of the Nile, whose waters are augmented by rains falling along the upper part of its course only. The Ganges, and other rivers in Bengal, begin to rise in consequence of the rains in the mountains at the end of April, their rate of increase for the first fortnight being about an inch a day; this gradually augments to 3 or 5 inches a day, and the total rise amounts, by the end of June, to between 15 and 16 ft., or half the entire height it attains, before any quantity of rain falls in Bengal. But from the latter period, when the rains there become general, the medium increase of the water is about 5 inches a day; and by the end of July all the lower parts of Bengal are contiguous to the Ganges and Bramaputra, are under water. The progress of the inundation, in consequence of the fatness of the country, is very slow, being no more than half a mile an hour. Owing to this and other physical causes, the difference in the height of the waters adjacent to, and at a distance from, the sea, is very considerable, but increases in proportion to the distance. In the lower part of the Sunderbunds, the influence of the inundation is at ordinary times little or not at all felt; at Luckimpore, about 10 m. inland, it is when highest about 5 ft. in elevation; at Decca 14 ft.; at Cuttee 31 ft.; and at Jellingee, near the apex of the delta, 32 ft. The total increase at the latter place may, however, in medium years, be set down at 31 ft. The rise of the inundation continues till nearly the middle of Aug. For a few days preceding the 15th of that month, its height is nearly stationary; but it then begins to decrease, notwithstanding that great quantities of rain continue to fall for the next six or seven weeks. During the latter

half of Aug., and the whole of Sept., the decrease is from 3 to 4 inches a day; from Sept. till the end of Nov. it gradually lessens from 3 in. to 1½ in. The decrease of the inundation, however, does not uniformly keep pace with that of the river, by reason of the height of the banks; but after the beginning of Oct., when the rains have nearly ceased, the remainder of it goes off quickly by evaporation, leaving the lands highly manured. The Ganges decreases at the average rate of half an inch a day, from the end of November to the latter end of April, when it is lowest in Bengal, though the rains in the mountains have already begun to augment it in the upper part of its course. Major Rennell estimated the quantity of water discharged by the Ganges per second in the dry season at 80,000 cubic ft., and in the rainy season at 405,000 cubic ft.; being for the average of the year 180,000 cubic ft. per second. But, according to some observations made at Ghazipore, above Calcutta, by Mr. Everest, in 1831, it would appear that in the 4 months of the flood season (June to Sept.) about 500,000 cubic ft. per second are discharged; while the average for the remainder of the year is only 100,000 cubic ft. per second. The quantity of earth brought down by the river is very great. According to Mr. Everest, the solid matter subsided in the water during the rains weighs about 1.428th part of the water, and occupies about 1.856th part of its bulk; giving a discharge of about 577 cubic ft. of mud per second, or 6,089,041,500 cubic ft. for the discharge in the 122 days of rain. The total annual discharge of mud is estimated at 6,368,777,440 cubic ft., the weight of which, according to Mr. Lyell, would exceed 60 times that of the great pyramid of Egypt! (*Journal of the Asiatic Society*, No. 6. p. 238.; *Lyell's Geology*, i. 361—364.)

A very striking effect of the inundation of the Ganges is the change produced by it, year after year, in the bed of the stream. This happens in numerous parts of its course through the lower portion of the great plain of Hindostan; but particularly in Bengal, where the soil is the most loose and yielding. The different branches of the river constantly shifting their places, a number of extensive *fleets*, or marshes, are continually being produced; and the geographical face of the country, the condition and extent of private properties, &c., change in the same proportion. In consequence, also, of the looseness of the soil through which it flows, the river is alternately forming and destroying islands in its bed, some of which are 4 or 5 m. in extent, yet formed or removed in the space of a few years. Certain tracts are preserved from the inundation by being surrounded by dykes, the collective length of which was estimated in Rennell's time at upwards of 1,000 m. The policy of their erection has been considered very doubtful, for the land has to be irrigated at certain periods, when the dykes must be cut; besides which, they do not always answer their purpose, owing to the want of tenacity in their materials; and they are maintained at a great expense. The country has, however, been brought by them into so artificial a state, that there is now no alternative but to persist in keeping them up.

The Ganges, like the Brahmaputra, the Amazon, several European rivers, the Gulph of Cambay, on the opposite side of Hindostan, &c., is subject to the phenomenon of the *bore*, or a rapid rush of the tide in a perpendicular face, up the river to a considerable distance. It is especially strong at spring tides. This occurs in all the mouths of the Ganges, and particularly in the Hooghly, through which branch it ascends as far as Culna, or even Nudda, 300 m. from the sea. The column of water is sometimes a dozen feet in height near the mouth of the river, and often 5 ft. high opposite Calcutta. Its appearance is that of a monstrous billow in a storm, the surface of a foaming surf; its sound resembles that of a steam-boat, but is infinitely louder. Sometimes it takes one side of the river, sometimes the other: it never extends over the whole basin. "The time of its approach being well known, hundreds of boats may then be seen rowing, as for life, towards the middle of the river, the crews urging on each other with wild shouts or shrieks, though at the moment no danger appears; but soon afterwards the spectator is made sensible how necessary was the precaution, as the *bore* foams by with tremendous noise and velocity." (*Heber, in Mod. Trav.* ix. 108.)

But, in the words of Mr. Crawford,—"With all the difficulties and dangers of the Ganges, the English, if their Indian conquests be of any advantage to them, owe almost as much gratitude to the Ganges as the Hindoos themselves, for unquestionably to it they are indebted for their Indian empire. It is the great military highway which enabled us to conquer the richest provinces of Hindostan,—the acquisition of which enabled us eventually to conquer and maintain the rest of our possessions." (*Embassy to Shaw, &c.* i. 74.) Its value to the natives of Hindostan is immense. It is, and always has been, the grand route of communication and traffic in that country, throughout which the roads adapted for the conveyance of goods are very few. Not only the main stream, but all its tri-

butories from the N. are navigable for large or small boats, to the very foot of the mountains, for more than half the year; thus forming a most extensive system of inland navigation. Sixty years ago, Major Rennell estimated the number of boatmen employed on the Ganges, in Bengal, &c., at 30,000, and the value of the commercial exports and imports conveyed by its means at 2,000,000*l.* a year. But ten times the above number of boatmen would apparently be nearer the mark in such a region of rivers, where almost every cultivator and fisherman is also occasionally a navigator. And at present the gross amount of the imports and exports embarked on its waters varies between 10,000,000*l.* and 12,000,000*l.* annually (*see CALCUTTA*), independent of the inland trade, which has, doubtless, not a little increased with the increase of the pop., and the greater degree of security afforded to commerce under the English rule.

Perhaps no river in the world has on its banks so many populous cities. On different branches of the delta are placed Calcutta, Moorsheadbag, and Dacca, the three great cities of Bengal, with a united pop. of little short of a million; besides Chinsura, Chandernagore, Hooghly, Cutwa, Boorhampore, Cossimbazar, Kishenagur, Jassore, &c. Proceeding up its course, we find on its banks Rajmahal, Monghrir, Patna, Ghazipore, Benares, Allahabad, Cawnpore, Furruckabad, &c.; with myriads of villages, temples, and bungalows.

There are no bridges over this river after it has emerged from the mountainous region; and the natives, who attempt to cross it where boats are not used, do so by means of empty water-jars. The native craft used in the Ganges vary greatly in different parts of its course. The flat clinker-built vessels of the W. districts give way about Patna to lofty, deep, and heavy boats, which navigate the river thence to Calcutta. In the Sunderbunde, again, the shallowness of the streams requires that the vessels should be without keels; and the banks there being impracticable for the tracking-rope, rowing is the chief method of propulsion. The boats on the main arm of the Ganges, and others in the E. part of the delta, are better than those on the Hooghly, though all are of a very rude and cheap kind.

The Ganges, from Gangoutri to Sangor Island, is considered holy by Hindoos of all castes, though in some places much more so than in others. Hindoo witnesses in British courts of justice are sworn upon the water of the Ganges, as the Christians and Mussulmans are upon their sacred books. The Ganges water is believed by the Hindoos to purify from all sins; many ablutions and suicides accordingly take place in it; and the feet of the dykes, when they are sufficiently near residents, are in most instances immersed in it. (*Rennell's Memoir on a Map of Hindostan*, pp. 335—355.; *Hamilton's Hindostan and E. I. Gaz.*; *Ritter's Erdkunde von Asien*, iv. part 2. pp. 1100—1248.; *Asiat. Researches*; *Colebrooke*; *Heber*; *Prinsep*, &c., *passim*.)

GANJAM, a distr. of British Hindostan. *See* CIRCARS, NORTHERN.

GANJAM, a town of Hindostan, cap. of the above distr., near the coast of the Bay of Bengal, 84 m. S.E. Cuttack, and 533 m. N.E. Madras. It formerly was a considerable pop., as well as numerous and excellent private houses belonging to British civil officers, a fort, cantonments, &c.; but it has now, in great part, been deserted and fallen into decay. (*Hamilton's E. I. Gaz.*.)

GANNAT, a town of France, dép. Ailier, cap. arrond., on the Ardolet, 33 m. S. Moulins. Pop. (1836) 5,109. It is ill built. It was formerly fortified, and the remains of its ancient castle still serve as a prison. It has an hospital, and a tribunal of primary jurisdiction.

GAP (an. *Papier-mont*), a town of France, dép. Hautes Alpes, of which it is the cap., in a wide valley, nearly 2,500 ft. above the sea, surrounded by sterile Alpiques ranges, and on the road from Paris to Marseille by way of Grenoble, 44 m. S.E. Grenoble; lat. 46° 33' 37" N., long. 5° 52' E. Pop. (1836) 5,561. It is a very ill-built and generally disagreeable town. Its principal public edifices are, the cathedral, prefecture, town-hall, bishop's palace, hall of justice, and barracks, some of which are good buildings. The cathedral is in the Gothic style, and richly ornamented; it contains the tomb and effigy of the celebrated comble de Lesdiguières. The tomb is a sarcophagus of black marble, surrounded with bas-reliefs in alabaster, representing the principal actions of that warrior. It has several other churches, a communal college, a society of emulation, a museum of natural history, collections of paintings, sculpture, antiquities, and physical objects, and a small theatre. The town is supplied with water by two small rivulets; but these often fail, and in 1833 a public edifice, capable of holding 30,000 hectolitres of water, was constructed for the general use of the inhab.

Gap is the seat of tribunals of primary jurisdiction, linen commerce; it has manufactures of woollen cloth, linen fabrics, silks, charnols and other kinds of leather, and cotton yarn. Its immediate vicinity is very fertile; there are in it many marble quarries known to the ancients

Romans, and many mineral springs. This town is of very great antiquity: it was the cap. of the *Tricoriti*, under the name of Vap. It became the seat of a bishopric in the 4th century, and belonged for a lengthened period to its own prince or count bishops. It suffered greatly in the middle ages, from the devastations of the Lombards and Saracens, and from repeated sieges, fires, the plague, religious wars, &c., but, more than all, from the revocation of the edict of Nantes. Previously to 1680, Gard is said to have had 16,000 inhab. (*Hugo, art. Hautes Alpes; Guide du Voyageur, &c.*)

GARD, a dep. of France, in the S. part of the kingdom, formerly comprised in the prov. of Languedoc; between lat. 43° 27' and 44° 27' N., and long. 3° 17' and 4° 50' E.; having N. the depts. Lozère and Ardèche; E. the Rhone, separating it from Vaucluse and Bouches-du-Rhone; W. Aveyron; and S. Hérault, the Mediterranean, and the Isle de Camargue. Area, 592,108 hect. Pop. (1836) 265,359, about 140,000 of whom are Protestants. The N. and W. parts are occupied by ramifications of the Cévennes, the general slope of the dep. being from N.W. to S.E., in which latter part of its surface there is a considerable extent of level country, with numerous and extensive pools and marshes. Most of the rivers have a S.E. direction; the principal are the Gard or Gardon (whence the dep. derives its name), the Cèze, and the Vidourle. The Gard, which rises in the Cévennes from several sources, runs through the centre of the dep., and falls into the Rhone not far from Beaucaire, after a course of about 50 m. It at first passes by Vough, a succession of deep mountain forges; and when the snows in the Cévennes begin to melt, it subjects the lower parts of the country through which it passes to extensive and often very destructive inundations. Its bed sometimes increases in width to nearly a mile; and its waters not unfrequently rise from 18 to 20 ft. in a few hours. The Hérault has its source in this dep. Climate variable, but for the most part hot and dry. The N. wind, or *bise*, blows sometimes with great impetuosity, and the *sereno* is by no means rare. The arable lands comprise about 137,500 hectares; vineyards about 71,000 do.; forests 104,472 do., and meadows about 158,000 do. Though the arable land is in general pretty fertile, the produce of corn, owing to the extremely backward state of agriculture, is estimated at only 650,000 hectolitres, being about half the quantity required for home consumption. It is principally wheat, oats, and barley. A good many potatoes are also grown, and in the mountain region chestnuts go far to supply the place of corn; the Cévennes being covered with chestnut woods. The plough described by Virgil, drawn by 2 mules, is in common use. The annual produce of wine is estimated at 1,120,000 hectolitres, a third part of which is consumed in the dep.; the wines of St. Gilles and Favel are those most esteemed. The date, jujube, pistachio, pomegranate, &c., flourish in the open air; oranges and lemons are grown, but a good deal of care is required in their culture. Olive trees are grown on low hills with a S. aspect; but they suffer severely from cold winters, and their number has decreased of late. Gard is the principal dep. in France for the culture of the mulberry; in 1834, there were estimated to be nearly 5,710,000 trees, being more than double the number in 1820. The quantity of cocoons collected in 1835, amounted to 2,695,230 kilog. In 1830 about 500,000 sheep belonged to this dep., yielding about 900,000 kilog. of wool. Many of the flocks are sent to feed on the Alps in the summer. In 1835, of 114,393 properties subject to the *contribution foncière*, 51,363 were assessed at less than 5 fr., and 19,554 between 5 and 10 fr.; the number of considerable properties is greatly below the average of the kingdom. Gard is rich in minerals; and mining, though ill-conducted, constitutes one of the chief sources of its wealth. Iron, argentiferous lead, antimony, zinc, manganese, &c., are found in the mountains; and gold is met with in the sands of some of the rivers. Iron is particularly abundant; the forges of the arrond. of Alais alone employ from 1,000 to 1,300 hands. In 1835, 13 coal mines were wrought, employing about 800 hands, and yielding about 460,000 metrical quintals. Great quantities of salt are obtained from the salt mines on the coast, which altogether occupy a surface of 96 hectares. In the salt pans of Peccalis, during June and July, as many as 2,000 hands are employed to wash the produce. About 1,200 workmen are employed in the gypsum, mill-stone, and other quarries. The value of the mineral products was estimated, in 1835, at 2,593,000 fr. Gard may be placed near the head of the depts. in the S. of France for manufacturing industry: it is especially distinguished for its manufactures of silk. The principal seat of these is Nîmes, where they employ about 15,000 hands. The *États des Grains* &c. *Monsieur* estimates the value of the silk fabrics annually produced in the dep. at 18 million fr. The other manufactures are those of cotton and woollen fabrics, hats, paper, pasteboard, brandy, leather, glass, earthenware, &c.; there are besides many tawing and dyeing esta-

blishments. In the neighbourhood of the coast canals are numerous, and include those of Beaucaire, Siveréal, Grand Rouhine, &c. There is, however, but one seaport, Aigues Mortes, and this is 4 m. from the Mediterranean, with which it communicates by the last-named canal. 102 fairs are annually holden in the dep.; among them is the celebrated one of Beaucaire (which see). Gard is divided into four arrond.: chief towns, Nîmes, the cap., Alais, Uzès, and Le Vigan. It sends 5 mems. to the ch. of dep. No. of electors (1838-39), 2,730. Total public rev. (1831), 11,891,796 fr.; expenditure, 6,276,356 fr. The antiquities in this dep. belong principally to the Roman period. The principal is the amphitheatre (*see Nîmes*), and the *Pont de Gard*. The latter is an aqueduct, and one of the most splendid relics of the Roman power, built over the Gardon, about 10 m. N.E. Nîmes. Ingalls thus describes it (*Switzerland, &c.*, ch. xxii.): "The aqueduct is formed upon three bridges, one above another; the total height, from the level of the river to the top of the aqueduct, being 156 ft. The undermost of the bridge consists of 6 arches through the largest of which the river passes. The middle bridge has 11 arches; and the uppermost has 35 arches (but these are much smaller than those of both the other tiers). Above this is the aqueduct, which is 4½ ft. high and 4 ft. wide. The arches both of the lower and middle bridge are unequal; which, if it does not increase the architectural beauty of the structure, certainly adds to its picturesque effect. The two lower stories of the bridge are formed of hewn stones, placed together without the aid of any cement; but the masonry underneath the aqueduct is of rough stones cemented, by which all filtration was of course prevented." After the decline of the Roman power, the Vandals, Visigoths, Saracens, and Franks successively possessed this dep. (*Hugo, art. Gard; Official Tables; Dict. Geog., &c.*)

GARDA (LAKE OF), an. *Lacus Benacus*, a famous lake of Austrian Italy, bounded by the provs. of Mantua, Brescia, and Verona, and the circ. of Rovereto in the Tyrol. From Peschiera, at its S.E. extremity (16 m. W. Verona), it stretches N.N.E. to Riva, a distance of about 35 m. Its lower or S. portion is about 13 m. across where broadest; but its upper or N. portion is not more than from 3 to 4 m. across. It is every where enclosed by ramifications of the Alps, except on the S., where the luxuriant plain presents a striking contrast to the magnificent mountain scenery that clothes round its upper waters.

On the S. shore of the lake, between Peschiera and Rivoltella, the narrow peninsula of Sirmione projects about 4 m. into the lake. It is joined to the mainland by a low slender neck, but behind this it rises into a hill covered with olives, at the extremity of which are some ruins, said to be those of the villa of Catullus. But whether this be so or not, it is, at all events, certain that the poet had a country-house in this singularly beautiful situation; and he has expressed his admiration of and attachment to it in some fine verses:—

*Peninsulam Sirmio, insularumque stagna
Ocellis, quasque in lacinisque stagnis
Mœque vasto fert uergetur Neptunia stans
Quamvis liberet, quamvis letus in visio!*

Catull. 32.

"The soil of this peninsula," says Eustace, "is fertile, and its surface varied; sometimes shelving in a gentle declivity, at other times breaking in craggy magnificence; and thus furnishing every requisite for delightful walks and luxurious baths; while the views vary at every step, presenting rich coasts or barren mountains, sometimes confined to the cultivated scenes of the neighbouring shore, and at other times bewildered and lost in the windings of the lake and the recesses of the Alps." (*4. 208. 5vo.*)

The surface of this lake is elevated about 320 ft. above the Mediterranean; it is generally deep; its waters are remarkably pure and limpid; and it is well stocked with fish. In the beginning of summer the level of its surface is raised 4 or 5 ft. by the melting of the snow on the Alps. It receives the waters of the Sarco at its N. extremity near Riva; but none of its other feeders are of such importance as to merit any special notice. Its surplus waters are carried off by the Mincio, which issues from it at Peschiera. A great number of towns and villages are built upon its banks, of which the principal, besides Peschiera, are Desenzano, Salò, Gargnano, Riva, Garda, whence the lake has its modern name, &c. The greater number of these towns have safe and commodious harbours, and a good deal of trade is carried on upon the lake. Like all Alpine lakes, it is subject to violent storms and gusts of wind, a peculiarity to which Virgil has alluded—

Fœdibus et frœnitibus emurgens, Seneca, met. 3.

Geogr. line 160.

GARLIESTOWN, a village and sea-port of Scotland, co. Wigton, at the head of a small bay. W. coast of Wigton Bay. Pop. 560. The main street is in the form of a semicircle, facing the sea. The harbour, which is tolerably safe and commodious, is the centre of a good

deal of coasting trade; and it is the only port in Wigtownshire at which the steamer that piles between Galloway and Liverpool touches. Galloway House, the seat of the noble family of Galloway, is in the immediate vicinity of the village. Patrick Hannay, a poet of the 17th century, whose works are now so rare that a copy recently brought, at a public sale, £21.10s. 6d., was born at Sorbie Place (of which his father was proprietor), near Gartshore. (*Murray's Lit. Hist. of Galloway*, 2d. edit. p. 268.)

GARMOUTH, a sea-port of Scotland, co. Elgin, at the mouth of the Spey, 35 m. N.W. Aberdeen, and 64 m. N.E. Elgin. Pop. 675. The harbour was injured by Morayshire floods in 1829, by the deposition of gravel in the bay; but it is still the principal shipping place in the co. The chief exports are timber, grain, and salmon. The value of timber (which is floated down the Spey from forests in the interior) exported here, was, at one time, estimated at 40,000*l.* a year; but it now seldom exceeds 1,100*l.* About 20,000 qrs. of grain, chiefly oats and wheat, are annually exported. The Spey Fishing Company's salmon smacks do not come into the harbour, but load in the bay. From 8 to 12 such smacks are employed in conveying salmon, chiefly to the London market. In 1854, 73 cargoes were shipped; each cargo contained, at an average, 280 boxes, or 280 cwt. of fish, worth 3*l.* per cwt., or, in the aggregate, 102,240*l.* But this produces above the general average. (*New Stat. Acc. of Scotland*, *Speymouth*.)

GARONNE, a river of France, which see. See also GIRONDE, DEP.

GARONNE (HAUTE), a dep. of France, region S., formerly comprised in the prov. of Languedoc, between lat. 42° 40' and 43° 55' N., and long. 0° 37' and 2° 3' W., having N. the dep. Tarn-et-Garonne, E. those of Tarn and Aude, S.E. Ariège, W. Gers and Hautes Pyrénées, and S. the Pyrenees. Area, 618,556 hectares. Pop. (1836) 454,727. Its S.W. portion is covered with lofty mountains, the highest of which, M. Maladetta, is 11,190 ft. above the level of the sea; and among which there are numerous glaciers. In the N.E., there are some plains of considerable extent. The Garonne rises a little beyond the Spanish border; but most of the upper part of its course is in this dep., which hence derives its name. The other chief rivers are the Tarn, Ariège, and Salat, all of which have a N. course, and are tributary to the Garonne. Climate generally temperate; but none of the Pyrenean depts. suffers so much from hail-storms. These, according to Hugo, have, within a period of 20 years, destroyed 3,000,000 quintals of standing corn. This is an essentially agricultural dep., and is reckoned one of the most productive of grain. The arable land amounts to about 352,000 hectares; and the produce of corn is, in general, nearly double what is required for home consumption. In 1833, the crops of all sorts were estimated at 2,119,398 hectolitres, of which wheat made about a half; the rest consisting principally of maize, millet, and oats. Vineyards occupy 48,908 hectares, and about 470,000 hectol. of wine are made annually; the best kinds are those of Fronton, Villandrie, Montesquiou, &c. Garden cultivation is well attended to. Near Toulouse, Mr. Inglis says, "corn-fields, vineyards, gardens, and country-houses, occupy every inch of land; and the appearance of the country people bespeaks a healthy and happy condition." Orange trees are grown for the sake of their flowers; the culture of the mulberry tree is very little pursued. The mountains and valleys afford good pasturage; but there is very artificial meadows; and the number of cattle is smaller than in the contiguous depts. Near Toulouse, a fine breed of horses was formerly raised for the dragoon service, but it has been suffered to degenerate. Poultry are plentiful: the *pâtés de Toulouse*, made of ducks' livers, enjoy a high reputation. In 1835, of 122,226 properties subject to the *contribution foncière*, 59,453 were assessed at less than 5 fr., and 22,291 at from 5 to 10 fr. The number of considerable estates is, however, above the average of the depts. Mines numerous, especially those of iron; but there are others of copper, antimony, blismuth, zinc, lead, &c.; and some important marble quarries. The value of the mineral products, in 1835, was officially estimated at 1,539,845 fr. Mineral springs are abundant: many of them are visited by invalids; among which may be specified those of Bagneres de Luchon. Manufactures various, but not extensive or flourishing; the chief are of tools and other metallic articles, coarse woollens, cotton and linen fabrics, leather, sail-cloth, hats, watches, mathematical instruments, &c. The trade is greatly augmented by the Canal du Midi, which commences in this dep. Toulouse is also the entrepôt for supplying the N. of Spain with the products of central and N. Europe. The dep. is divided into 4 arrondis.; it sends 6 mems. to the ch. of dep. Number of electors (1838-39), 3,185; chief towns, Toulouse, the capital, Muret, St. Gaudens, and Villefranche. Total public revenue (1831), 13,178,204 francs. (*Hugo*, art. *Haute Garonne*; *Encyc. des Grms. du Monde*.)

GASCONY, the name of one of the old provs. of France, which comprised previously to the revolution the country now included in the depts. of the *Hautes Pyrénées*, *Gers*, and *Landes*, and portions of the country now included in the depts. of *Basses Pyrénées*, *Haute Garonne*, and *Lot et Garonne*.

GATEHOUSE, a bor. of regality, river-port, and market-town of Scotland, stewartry of Kirkcubright, on the Fleet, a little above where it falls into Fleet Bay, and on the high road from Dumfries to Portpatrick, 28 m. S.W. Dumfries, and 64 m. W. by N. Kirkcubright. Pop. 3,000. It is beautifully situated in a romantic valley opening on the S. to the sea, and bounded on both sides by finely wooded, picturesque hills. The town, which is principally situated in the par. of Girthon, on the E. side of the Fleet, that is here crossed by a bridge, consists principally of three parallel streets, and is remarkably neat, clean, and well built. The par. church, erected in 1817, adjoins the town on the N.; and it has also a secession meeting-house, and a place of worship for Independents. There are 4 schools in the parish, one of which is parochial, and the expense of one for young girls is wholly defrayed by Lady Anne Murray. The Fleet is navigable to Gatehouse by vessels of 180 tons burden; and within these few years it has been deepened, straightened, and its navigation greatly facilitated through the exertions, and at the same expense, of Mr. Murray, M.P. Gatehouse had formerly 3 cotton mills; but of these only 2 are now at work: they employed, in 1840, 200 hands. It has also a brewery, 2 tan-works, and a branch of the Com. Bank of Scotland. It was created a bor. of barony in 1795; and is governed by a provost, 2 bailies, and 4 councillors. A bor. court for the recovery of debts not exceeding 5*l.* is held once a fortnight. Market-day, Saturday; and a rural fair 4 times a year.

Gatehouse is mainly indebted for its existence and prosperity to the public spirit, liberality, and intelligence of the late Mr. Murray of Broughton, and his son, the present Mr. Murray, M.P. for the stewartry of Kirkcubright, on whose estate it is built. Calyhouse, the magnificent seat of the Murray family, lies about 1 m. S. from the town. It is wholly of granite, finely polished: it was constructed after a design by Adams, but has been modernised and signally improved by its present proprietor. It is beautifully situated; and whether we regard the variety and extent of the grounds, or the classical appearance and magnificence of the house, it is certainly surpassed by very few residences in any part of the United Kingdom. It has a good collection of pictures; and in its unrivalled marble vestibule are some fine pieces of sculpture, including a noble head of Napoleon, by Thorwaldsen.

GATESHEAD, a parl. bor., town, and par. of England, E. div. of Chester ward, co. Durham, on S. bank of river Tyne, which divides it from Newcastle, of which it is a suburb, and with which it is connected by a bridge across the river. Area of par. and old bor. (a small part of Heworth chapelry is included in the new bor.), 3,320 acres. Pop. of do. in 1831, 11,767; 1831, 15,177. "It consists of only one good and wide street, and which is the high road to the N. The several narrow streets and lanes which compose the remainder of the town branch off on each side of the principal street, and the pop. on the different sides is not very unequal. There is not any appearance of wealth or houses belonging to the richer classes; the town is densely populated with the families of the manufacturers and pitmen; the master manufacturers or proprietors of the coal pits reside in Newcastle or in the neighbourhood of the two Fells, where they can enjoy a better atmosphere than in the town." (*Municipal Board Rep.*) The best street runs in a curve by the church to the river, saving the steep descent of the High Street. The par. church is a spacious cruciform structure, regularly built, having a handsome and lofty tower; the interior was wholly repaired, at great expense, in 1836. The rectory, which was until lately close to the church, is situated in the suburbs. In Gateshead-fell, which was made a separate par. in 1809, is a well-built church, opened in 1825. The patronage of both is vested in the Bishop of Durham. St. Edmund's chapel, which stands S. of the town, was rebuilt in 1810; the chaplain is appointed by the rector of Gateshead. There are several places of worship for various denominations of Dissenters, of whom the Wesleyan Methodists are the prevailing body. The number of schools in the bor. (according to the *Durham Par. Schools' Report*) is 42, educating about 2,000 children; there are 11 Sunday-schools, attended by 1,053. Of these, the anchorage school, founded in 1664, held in the church-yard, is free, and endowed with a principal sum of 400*l.* St. Edmund's hospital, founded in 1264, was in early times a considerable monastery; it was re-established by James I. in 1611, and now consists of a master, chaplain, and ten brethren, who divide the funds, about 450*l.* annually. The rector for the time being is the

master, who appoints the brethren. There are also almshouses for old women.

"Gateshead is a place of considerable importance, not only from its proximity to, and commercial connection with, Newcastle, from which it is separated only by the river Tyne, but more particularly from the numerous glass manufactories and iron-works within the town, and from the coal pits in its immediate neighbourhood. High and Low Fell, which are hamlets in the S. part of the par., are rural districts." Here are large quarries for grindstones, which are much esteemed, and sent to all parts of England. (*Municip. Bound. Report.*) The old bor. of Gateshead is supposed to have been incorporated in very early times; but there is no charter extant, "the ancient deeds and papers having been surreptitiously removed many years ago." Without doubt, the jealousy of the more powerful town of Newcastle, and the long-continued disputes respecting the privileges of the Tyne navigation, deeply injured the interests of this bor. It was originally governed by a bailiff appointed by the Bishop of Durham, and subsequently by two stewards, who managed the borough property, subject to the borough-holders' and freemen's control; but, under the Municipal Reform Act, it is divided into three wards, and is governed by 6 aldermen and 18 councillors. The Reform Act conferred on this bor., for the first time, the privilege of sending 1 mem. to the H. of C.: it includes, as already stated, part of Heworth chapel within the limits of the non-par. bor. Registered electors, in 1838-39, 534. The bor. rev., including rates, amounted, in 1839, to 509*l.* The local act 54 Geo. III. regulates the leasing of property, the lighting, cleansing, and improvement of the town. The assessed taxes of Gateshead in 1835 were 1,300*l.* Rental in 1835, 19,400*l.*; and the rates produced 3,470*l.* Fairs, chiefly for hiring servants, are held on the second Monday in April, and the first Monday in Nov.

GATTON, a bor. and par. of England, co. Surrey, hund. of Reigate, 17 m. S. London. Area of par., 1,140 acres; pop. of do., in 1831, 145. The bor. is quite considerable, and was formerly one of the most perfect specimens in England of a nomination or rotten bor. It sent 2 mems. to the H. of C. from 1451 down to the passing of the Reform Act, by which it was disfranchised. The right of voting was nominally in the inhab. paying *scot and lot*, but really in the lord of the manor.

GAUDENS (ST.), a town of France, dép. Haute Garonne, cap. arrond., on a hill near the Garonne, 48 m. S.W. Toulouse. Pop. (1836) 4,875. It consists principally of one spacious well-built and well-kept street. It has several churches, one of which is among the oldest in France, several convents, tribunals of primary jurisdiction and commerce, a communal college, and a society of agriculture. It has manufactories of coarse serge and tape, water-mills for sawing, &c.; and a brisk trade in the natural produce of its neighbourhood. (*Hugo, &c.*)

GAWELGHUR, a fortress of Hindostan, in the N. part of the Nizam's dom., cap. of a distr. of the same name, on a high and rocky hill, 11 m. N.W. Ellichpoor. It is very elaborately fortified, and was formerly considered very strong, but it was taken by storm in 1803, by the forces under General Wellesley (now Duke of Wellington) and Colonel Stevenson, after a siege of only 2 days.

GAYA, a town or city of British Hindostan, presid. Bengal, prov. and distr. Bahar, of which last it is the modern cap., on the Phalgua, a tributary of the Ganges, 46 m. S.W. Bahar, and 86 m. S.W. by S. Patna. It is estimated to contain nearly 7,000 houses, most of which are densely inhabited; but the pop. is very variable and uncertain. Gaya is frequented by great numbers of pilgrims and devotees, often amounting to several thousands. It consists of two parts, the old town of Gaya, and the modern one of Sahebunge. The former, which is the residence of numerous Brahmins and others, and considered by the natives as a place of great sanctity, stands on a rocky eminence; the latter, chiefly laid out by the British, and the seat of trade as well as of the European residents, is situated in a plain between the former and the river. "The old town of Gaya is a strange looking place, but its buildings are much better than those of the quarter named Sahebunge, the greater part of the houses being of brick and stone, and many of them two or three stories high. The architecture is very singular, with corners, turrets, and galleries, projecting with every possible irregularity. The streets are narrow, dirty, crooked, uneven, and encumbered with large blocks of stone, or protruding angles of rock."

Gaya is uncommonly hot, and in spring obscured by perpetual clouds of dust. The streets in Sahebunge are wide, perfectly straight, and kept in good order, though not paved, with a double row of trees, leaving in the middle an excellent carriage road, with a footpath on each side.

In the immediate vicinity are the ruins of Buddha-Gaya, traditionally supposed to have been the place of

the residence and apotheosis of Buddha (the Gautama of the Indo-Chinese nations). These ruins consist mostly of irregular and shapeless heaps of brick and stone. The number of vaulted caverns cut out of lumeneous masses of solid granite is incredible, as is the number of images scattered around to the distance of 15 or 20 m. Among the latter is a gigantic figure of Buddha, in the usual sitting posture; there are now, however, no Buddhists at Gaya, the worship of the Brahminical deities,—many groups of which are sculptured on the rocks—having entirely superseded that of the rival divinity. The present town of Gaya contains no ancient monuments whatever, and appears to have derived all its sanctity from its contiguity to the site of the ancient city. (*Hamilton's E. I. Gazetteer*; *Buchanan*; *Hamilton's Mod. Trav.*, &c.)

GEFLE, a sea port town of Sweden, cap. of a Län, and at the mouth of a river of the same name, on the Gulph of Bothnia, 98 m. N. N.W. Stockholm; lat. 60° 29' 45" N., long. 17° 8' 30" E. Pop. (1836) 8,049. It is divided into four quarters by the river, which separates itself into three branches, and forms two islands, on which, as well as on either bank, the town is built. The houses, somewhat more than 1,000, are well built, some of stone, others of wood, and the streets, though irregular, are wide and well paved. The market-places are remarkable in point of size. The chief buildings are the church, the government-house, the town-hall, and the hospital. There are, besides, a gymnasium of some celebrity, 2 schools, an orphan asylum, and some unimportant manufactories of linen cloth, leather, and tobacco. The excellence of its harbour, defended by a long jetty, and having a depth of 18 ft. a little from the shore, gives it great advantages for trade. Its exports are fir-timber, pitch, tar, and iron; and its chief imports, wheat and salt.

GENEVA (CANTON OF), the smallest canton of Switzerland, at the S.W. extremity of which, and of the lake which bears its name, it is situated; but the canton Vaud and the canton de Vaud, W. France, are 913 square miles. Pop. (1838) 58,666, of whom 11,833 were strangers, 28,305 males, and 30,361 females. This canton, which ranks 22d in the confederacy, is composed of the territory of the ancient republic of Geneva, together with some communes formerly belonging to Savoy and France, annexed to it in 1815. Its surface is flat, or but slightly uneven. It is enclosed between the Jura mountains on the N.W., and some Alpine ranges in the opposite direction. The Rhone and Arve are the principal rivers. The climate is mild, but the land is not very productive. The cultivable soil comprises about 56,680 acres; of which the lands in crop make about a half, grass lands somewhat less than 1-5th, and woods about 1-10th. In average years from 29,000 to 32,000 imperial quarters of corn may be produced; but, as neither this nor any other species of agricultural produce is grown to an extent sufficient for home consumption, considerable quantities are imported.

Geneva is essentially a manufacturing canton; but as its manufactures and trade belong to the town, they will be more properly noticed in the following article. The legislative power is exercised by a body of 278 members, elected by such citizens above 25 years of age as pay direct taxes to the amount of about 15 fr. a year. Four *syndics* preside over this body, and are mems. of the executive council, or council of state; which is composed of 28 mems., elected from among the council of representatives, usually for life, but subject to a vote of censure, and removable at pleasure. The magistrates of the different judicial courts are appointed for a certain number of years by the former council. The canton is divided into 3 districts, in each of which there is a court of audience; besides these, there are in the cap. a court of appeal from the foregoing, a tribunal of commerce, and a supreme court of justice, composed of 9 judges. All trials are public. The French code of laws is generally operative. The press is free. As respects religion, 35,562 of the inhab. were (in 1838) Protestants; 24,996 Rom. Catholics; and 109 Jews. Education is in a flourishing state. The canton furnishes a contingent of 880 men to the army of the Swiss confederation, and a contribution of 32,000 Swiss fr. a year to its treasury. The public revenue in 1835 amounted to 33,555*l.* the expenditure to 33,250*l.*; but, according to Dr. Bowring's report, the receipts in that year were below the average of recent years. Except Geneva, the cap., this canton contains no town of importance. (For further details, see succeeding article.)

GENEVA (Germ. *Genf*), the most populous city of Switzerland, cap. of the above canton, situated in a picturesque country, abounding in the most enchanting and magnificent prospects, at the S.W. extremity of the lake of Geneva, 61 m. S.W. Berne, and 70 m. N.E. by E. Lyon; lat. 46° 13' N., long. 6° 39' E. Pop. (1838) 38,008. The Rhone divides Geneva into 3 parts: the city on the right bank, the quarter of St. Gervais on the left, and the island between them, enclosed by two arms of the

river. The city, or upper town, is the largest portion, and is in part built on an eminence, rising to nearly 100 ft. above the level of the lake. Its streets are narrow, crooked, and steep; but many of its private edifices are good: it consists almost entirely of the residences of the burgher aristocracy. The lower town, or quarter of St. Gervais, is the chief seat of commercial activity. It has narrow streets, and lofty houses. Some of the latter are furnished with a shed or pent-house, called a *dome*, which projects from the roof over the street, supported by wooden props reaching from the pavement; twenty-five years ago these appendages to the houses were almost universal. The island is upwards of a furlong in length, by about 900 feet broad, and connected with the other quarters by several bridges. The aspect of Geneva from the lake has been greatly improved of late years. An entirely new quarter has sprung up on the right bank of the Rhone, called the *Quartiers des Bergues*, displaying a handsome front of tall houses, among which is the *Hôtel des Bergues*, lined with a broad and fine quay, towards the lake. The unsightly houses that formerly lined the margin of the lake in the lower town, have been repaired and beautified; and a broad belt of land has been gained from the water to form a quay. This is connected with the *Quai des Bergues*, on the opposite bank, by a handsome suspension bridge, and another bridge communicating with a small island, situated at the point where the Rhone leaves the lake, is ornamented with a bronze statue of Rousseau. Geneva is surrounded on the land-side by ramparts and bastions, constructed about the middle of last century: these are of little use as fortifications, the city being commanded by some adjacent heights; but they serve as public promenades, and 3 iron suspension bridges have been thrown over them to facilitate intercourse between the city and the surrounding country. The gates of Geneva are closed from midnight to day-break; and after sunset a toll of 24 centimes (about 2½d.) is levied on all horses or carriages going out or in, and 10 centimes on foot passengers after 10 o'clock P.M.

Geneva has but few fine public buildings. The principal is the cathedral or church of St. Peter: it is in a conspicuous situation, has three steeples, and is an interesting specimen of the Gothic style of the 11th century; but a Corinthian portico, in imitation of that of the Pantheon at Rome, has been inconsiderately enough added to it. This church contains the tombs of Agrippa d'Aubign, the friend of Henri IV., and of the Count de Rohan, a leader of the French Protestants in the reign of Louis XIII. There are, besides, 3 Calvinist and 2 Lutheran churches, a Catholic church, and a synagogue. The town-hall and general hospital are almost the only other edifices worth notice. The last is an extensive and spacious building; in the chapel belonging to it the service of the English church is performed on Sundays. The *Musée Rath*, so named after its founder, is a neat building, containing a collection of paintings by native and other artists. The museum of natural history contains the geological collections of Saussure, Brongniart, and Decandolle, the collections of M. Necker, a cabinet of antiquities, and a reading-room well supplied with the best European journals. The academy, founded by Calvin, has faculties of jurisprudence, theology, natural science, and literature, and 39 salaried or honorary professors. It has attached to it a library of 40,000 vols., including many valuable MSS. Geneva has also a college for classical education; a school preparatory for the academy; a school of manufactures, established 1839; schools of watchmaking, drawing, music, &c., and many private schools. It has a public observatory; a society for the advancement of arts; societies of medicine and natural history, and other learned associations; lunatic and deaf and dumb asylums; and various other charitable institutions. About 26,000 hours a year are spent by the city in aid of the poor. The working classes have united in several benefit societies for mutual assistance, and a savings' bank was established in 1816, which had in 1835 a capital of 5,136,171 florins. The ancient palace of the bishops of Geneva has been converted into a prison; but in 1825 a new prison was established on the panoptical system, the first of the kind founded on the Continent. The prisoners on arriving are detained in solitary cells for a longer or shorter period, and afterwards set to regular work, during which, as well as at all other times, they are obliged to observe a profound silence. Each occupies a chamber by himself, and solitary confinement is the usual punishment for refractory behaviour. The prisoners have books distributed to them from the prison-library. A part of the produce of their labour is put aside for their own use; and when they finally leave the prison, a committee furnish them with employment. Geneva has an arsenal and a theatre; it is well lighted, and is supplied with water by a hydraulic machine situated in the island. There are various public walks within as well as without the walls, which command noble views of the Alps, the lake, &c.; amongst them are the Terrace

de la Treille, the squares of St. Antoine and Maurice, and the fine botanic garden, laid out in 1816. Geneva is a favourite place of resort of the English.

In the *Inhabitants*, Mr. Inglis remarks, "the stranger will find it difficult to discover any trace of the puritanism and severity of manners for which that city was renowned in earlier times. I never was among a livelier or gayer population. Amusement seemed to be the reigning passion, and religion little less a matter of form than it is in France on Sunday. After listening to a favourite preacher, the Genevese flock to the theatre. The shops also are open on a Sunday, and every man plies his trade as usual." (*Switzerland*, p. 177.)

The main source of the prosperity of this city consists in its manufactures; the principal of these are watches, jewellery, musical boxes, and objects of taste in the fine arts. In 1834, there were 274 master, and 1,333 working, watchmakers; and 117 master, and 663 working, jewellers. The number of watches annually made is estimated at upwards of 70,000, and of these at least 60,000 are of gold. In watchmaking and jewellery, it is estimated that between 70,000 and 80,000 oz. of gold, and about 50,000 oz. of silver, are used annually. The gems (most of which are pearls) used in jewellery and the embellishment of watches may be worth perhaps 20,000 £ a year.* The watchmaking business is divided into two branches; that of *haute horlogerie*, comprising chronometers, stop-watches, and other articles in which the perfection of the machinery is the highest merit; and that of *horlogerie de commerce*, in which the beauty of the work is its chief recommendation. The articles of the latter class are by far the most numerous. "The great advantage which the Swiss possess in competition with the watchmakers in England is the low price at which they can produce the flat cylinder watches, which are at present much in request. The watches of English manufacture do not come into competition with those of Swiss production, which are used for different purposes, and by a different class of persons. Notwithstanding all the risks and charges, the sale of Swiss watches is large, and it has not really injured the English watchmaking trade. The English watches are far more solid in construction, fitter for service, and especially in countries where no good watchmakers are to be found, as the Swiss watches require delicate treatment. English watches, therefore, are sold to the purchaser who can pay a high price; the Swiss watches supply the classes to whom a costly watch is inaccessible." (*Houring's Report*, p. 38.) The works or machinery of the watches are made principally at Fontainemelon and Beaucour in France. The unfinished work is called an *ébauche*, and is polished and perfected by the Genevese artisan. It is difficult to form a correct estimate of the wages earned by the latter, for, in the manufacture of watches, jewellery, and goldsmiths' work, almost everything is done by the piece, and not by daily wages. Watchmakers may generally, however, earn from 22. 8s. to 74. 12s. a month; makers of musical boxes, from 47. 18s. to 111. the engine-turners about the same; some of the workmen who make the movements may earn from 2s. 6d. to 4s. 8d. a day; others from 20 to 50 sous a day: the works which fall to the share of the women are of the latter class. In some kinds of work, skillful hands will earn no less than from 20 fr. to 25 fr. a day. In occupations unconnected with the manufacture of watches or jewellery, working locksmiths may earn from 3 fr. to 5 fr. (French), and cabinet-makers from 30 to 65 sous a day. The other manufactures of Geneva and its canton are principally horn and tortoiseshell combs, carriages, saddlery, agricultural implements, tools of all kinds, cutlery, fire-arms, enamel, musical instruments, printing types, and philosophical instruments of a very superior description. Lithography and engraving medals and vignettes are flourishing branches of art. Some factories of woollen cloth have been rather recently established; the produce of various spinning establishments finds consumption in Switzerland; and printing would form a very important and very productive branch of industry, were it not for the impediments thrown in the way of exportation to neighbouring countries. In 1816, as many as 30 tanneries were in existence. At present, however, tanning is carried on to but a small extent, though the very superior quality of the leather always insures it a preference in foreign markets, particularly in Italy. At the beginning of the 17th century the Genevese also carried on an extensive trade in silk stuffs, lace, &c.; and before the French revolution there were many extensive establishments for the manufacture of printed cottons besides factories of various other kinds. These no longer exist, most of them having been crushed by the system of prohibitions and high duties established by the continental powers during the embuing period. The watches and

* According to Pictet (*Statistique de la Suisse*, 1850), 100,000 watches are made or finished annually in the canton, most of which are of gold; half of them are ladies' watches, and a fourth part pocket-watches. The consumption of gold in good years is, he says, 75,000 oz.; of silver, 5,000 marcs; and of precious stones to the value of 1,000,000 fr. (50,000 £) a year.

jewellery, however, of Geneva still bid defiance to custom-house regulations, and are very extensively smuggled into France. A committee of master-workmen, with a syndic at their head, and the *consistoire de surveillance*, are appointed by the government to inspect every workshop, and the articles made in it, to guard against fraud in the substitution of metals not of the legal standard. By a law of 1815, the manufacture of any gold work of a lower standard than 780 is forbidden; and the legal standards for silver are fixed at 800, 875, and 900. The watch-makers of Great Britain buy largely in Geneva; the annual export of watches to England being from 8,000 to 10,000, of the average value of 10*l.* each. The jewellery sent from Geneva to England may be worth about 60,000*l.* a year; but owing to our prohibitions, and high duties upon foreign goods, a large proportion of the trade in Swiss watches and jewellery is contraband: the articles come through France, and the English consumer pays, of course, the costs and profits of the French smuggler. The imports from England are chiefly colonial produce, dyes, drugs, spices, bar and wrought iron, and woollen, cotton, silk, and other kinds of manufactured articles. The value of the British manufactures sold in the canton may, perhaps, be estimated at about 300,000*l.* a year, which no doubt would be greatly augmented, did we admit Genevese watches, and other manufactures, at a moderate duty. The accounts of the imports and exports are given by weight, which, of course, renders them good for little or nothing. It is said, for example, that in 1834 the imports into the cant. amounted to 300,830 quintals; and the exports, exclusive of watches and jewellery, to 120,000 quintals! If we adopted a criterion of this sort, the export trade of Newcastle would seem to be three or four times as great as that of London! Geneva is the seat of the council of state; the supreme court of justice for the cant.; a court of appeal from the district courts; and a chamber of commerce. The last has a very extensive jurisdiction; every commercial transaction, of whatever description, may be brought before it; and a private individual, who may have bought more of an article than he requires, and sells the surplus, becomes responsible to it.

Geneva is very ancient. *Extremum oppidum Allobrogum, est, proximumque Helvetiorum finibus, Geneva, seu, the winds of Caesar in speaking of this city. (De Bello Gallico, l. 6.)* Many Roman antiquities have been discovered in and near it; and in the island traces may still be discovered of a Roman structure, supposed to be foundations of one of the towers erected by Caesar to prevent the Helvetians crossing the river. In 426 Geneva was taken by the Burgundians, and became their cap.; it afterwards belonged successively to the Ostrogoths and the Franks, and formed a part of the kingdom of Arles, and the second kingdom of Burgundy. On the fall of the latter it fell under the sole dominion of its bishop, between whom and the counts of the Genevois, in Savoy, there existed incessant contests for its possession. At the Reformation the bishop was expelled, and the town, with its territory, became a republic. Calvin, having sought refuge in Geneva in 1536, was solicited to settle there, and was soon afterwards raised to the highest rank in the state, which he in a great measure governed for 25 years, with a severity and strictness that impressed deep and abiding traces on its jurisprudence and manners. In 1538 the famous Michael Servetus, who had been arrested at Geneva, at the instigation of Calvin, was accused of blasphemy in regard to the Trinity, and being tried and convicted, was ordered to be committed to the flames, which barbarous sentence was immediately carried into execution. The conduct of Calvin in this deplorable affair, though in part excused by the spirit and temper of the times, was directly hostile to every principle for which he had been contending against the church of Rome, and will ever remain a dark blot upon his character, and that of the early reformers. In 1782, in consequence of internal dissensions, Geneva was occupied by the troops of France, Sardinia, and Bern. In 1798 it was taken by the French revolutionary forces, and subsequently became the cap. of the *dép. Léman*. It was, with its territory, united to Switzerland as an independent canton in 1814. Few cities have produced more eminent individuals; amongst others may be specified J. J. Rousseau; Casanbon, the critic; Lefort, the friend of Peter the Great; Necker, and his daughter, Mad. de Staël; the naturalist Saussure, De Luc, Bonnet, and Jurine; Desmoulins and Huber; Dumont, the friend and editor of the best works of Bentham; the philosopher Abauzit; J. B. Say, the political economist; Simonde de Sismondi, the historian, &c. (*Swiss Rep. on Switz.*; Schütz, *Allg. Erdkunde*, vol. xxi.; *Ébel*; *Picot*, *Statist.*; *Engel's Switzerland*, &c.; *Encycl. des Gens du Monde*, &c.)

GENEVA (LAKE OF), or LAKE LEMAN (Germ. *Gonfersee*, an. *Lacus Lemanus*), the largest lake of Switzerland, near the S.W. extremity of which it is situated. It has N., E., and S.E. the canton of Vaud

or Leman; S.W. that of Geneva; and S. Savoy. It fills up the lower portion of a somewhat extensive valley enclosed between the Alps and the Jura. It is crescent-shaped, the convexity being directed N. W., and the horns facing S.E. Its greatest length—a curved line passing through its centre from Geneva at its W. extremity, to Villeneuve at its E.—is about 45 m.; but along its N. shore, the distance from end to end is about 55 m., while along its S. it is no more than about 40 m.; its breadth varies from 1 to 9 m.; its area is estimated at about 940 sq. m. Its greatest depth, near Meillerie, towards its E. extremity, is said to be 1,012 (950 Fr.) ft.: its level is about 1,500 ft. above that of the Mediterranean. In Aug. when its waters are the highest, its surface is often 4*ft.* above its level in March, when it is lowest. It is divided, in common parlance, into the Great and Little lake; the latter is more exclusively called the Lake of Geneva, and extends from that city for a distance of 14 m., but with a breadth never more than 2*½* m., to Point d'Yvoire; beyond which, Lake Leman widens considerably. The Rhone enters it near its E. extremity, bringing with it so much alluvial soil, that considerable encroachments are continually made on its upper end. Formerly, the lake was formerly on the margin of the lake, the basin of which it is said to have originally extended upwards as far as Bex! The Rhone emerges from the Lake of Geneva at its S.W. extremity, where its waters, like those of the lake itself, are extremely clear, and of a deep blue colour, circumstances which have been often adverted to by Byron. (See *Child Harold*, l. iii. c. 38. 35.) Lake Leman receives upwards of forty other rivers; the principal of which are, the Venoge, from the N., and the Drause, on the side of Savoy. It seldom freezes, and has never been known to be entirely frozen over. It is subject to a curious phenomenon called the *schicks*. This consists in a sudden rise of its waters, generally for 1 or 2*ft.*, but sometimes as much as 4 or 5*ft.*, followed by an equally sudden fall; and this ascent and descent goes on alternately, sometimes for several hours.* This phenomenon is most common in summer, and in stormy weather; its cause has not been satisfactorily ascertained, but it would seem to depend on the unequal pressure of the atmosphere upon different parts of the lake.

Lake Leman abounds with fine fish. Its banks are greatly celebrated for their picturesque beauty and salubrity. Their scenery is the most imposing at its E. extremity; but the whole of the S. shore exhibits great boldness and grandeur. The N. shore is of a softer character; it is adorned with a succession of low hills covered with vineyards and cultivated fields, and interspersed with numerous towns, villages, and habitations. Nyon, Rolle, Morges, Ouchy (the port of Lausanne), Vevey, Clarens, and the Castle of Chillon, are on the N. bank; on the S. or Savoy side, are Meillerie; Ripaille, the place of retirement of Pope Felix V.; Hionon and the *Château de Diodes* in the Genevese territory (the residence of Lord Byron in 1816). The first steam vessel in Switzerland, the William Tell, was launched on the Lake of Geneva in 1823; in 1838, there were four steam boats plying on it, two of which usually went daily from one extremity to the other and back in eight hours and a half. (*Picot*; *Ébel*; *Cannaligh*; *Murray's Handbook*, &c.)

GENOA (Ital. *Genova*, an. *Genoa*), a celebrated marit. city of N. Italy, once the cap. of an indep. repub., and now of a prov. division of the k. of Sardinia, at the head of the Gulf of the same name, 75 m. S.E. Turin, and 90 m. N.W. Leghorn; lat. 44° 24' 30" N., long. 8° 59' 55" E. It had, in 1838, a pop. of 97,631, exclusive of the garrison (6,000) and the merchant seamen, and those belonging to the royal navy, in all 17,636, making its total pop. 115,237. Genoa is built round, but principally on the E. side of its port, which is semicircular, the cord being about 1 m. in length. Two gigantic moles (*Molo vecchio* and *Molo nuovo*), project into the sea from either angle, and enclose and protect the harbour. The land on which the city is built rises amphitheatrically round the water's edge, to the height of 500 or 600*ft.*, so that its aspect from the sea is particularly grand and imposing. The white showy houses form streets at the lower part of the acclivity, while the upper part is thickly studded with detached villas. Behind all, the Appennines are seen towering at the distance of, perhaps, 10 or 15 m., their summits during a part of the year covered with snow. Genoa has a double line of fortification. The inner one encloses merely the city itself on the N. and E. sides of the port; the outer walls extend from either angle of the port back to the summit of the hills, on the declivity of which the city is built, and are 8 or 10 m. in length. The old or E. portion of the city consists of a labyrinth of excessively narrow, crooked, and dark streets, their breadth being generally no more than from 6 to 12*ft.* They run between a succession of lofty houses, 3, 4, and even 7 stories high, each story

* *Engel, del Golf de Monte. Murray (Handbook)* says,—"It never lasts longer than 25 minutes, but is generally less."

being from 12 to 15 ft. deep, the cornices under the roof of which sometimes project so far as to meet, and thereby exclude all daylight. "In these streets you meet with vast numbers of mules and some asses, carrying all sorts of articles, bricks, firewood, &c., on their backs; for wheeled carriages are only used in the broad streets, which are rare, except in the suburbs. The streets are paved with broad flags of lava, which are laid in mortar, and have the smoothness and durability of good masonry. In the middle of this pavement there is a pathway laid with bricks set on edge, about 2 or 3 ft. broad, and a little higher than the lava. This is for the accommodation of the mules, the lava being considered too smooth to afford their feet a sufficient hold." (*MacLaren's Notes on France and Italy*, p. 46.) The streets, narrow and steep as they are, are very clean, cool, and quiet. The newer part of the city, which stretches along the N. side of the port, is more regularly laid out, and contains some broad and very handsome streets, in particular that running from the *Piazza delle Fontane* to the *Piazza dell'Acquaverde*, near the W. gate, and including the *Strada Nova* and *Novissima*, the *Piazza del Vastato*, and the *Strada Balbi*. The last of these, says M. Simond, is entirely formed of palaces, more magnificent than those of Rome, and neater in their interior. Each is built round a court, and the best apartments are on the third floor, for the benefit of light and air. The roofs, being flat, are adorned with shrubs and trees, as myrtle, pomegranate, orange, lemon, oleanders, &c., 35 ft. high, growing not in boxes only, but in the open ground several feet deep, brought hither and supported on arches. Fountains play among these artificial groves, and keep up their verdure and shade during the heat of summer. In Italy, Genoa has acquired, and deserves, the title of *la Superba*. It exhibits fewer remains of ancient splendour than Venice, but more actual wealth and comfort. Its architecture is grand in its style, and admirable in its materials. Its palaces are numerous, and many of their principal gates 40 ft. high, with marble columns, courts paved with various coloured marbles in mosaic, broad staircases all of marble, rooms 30 ft. high with arched ceilings, adorned with gilded columns, large mirrors, superb crystal lustres, mosaic floors, the roofs paneled, and the panels filled with finely executed frescoes or paintings in oil, and divided by sculptured figures. Behind are orangeries. I visited four or five of these palaces; but there are multitudes." (*MacLaren's Notes*, p. 46.) The common houses are of stone plastered with stucco, the floor of marble. Of its palaces, that of Doria, built by and still belonging to the illustrious family of that name, is the largest and finest: it opens into large gardens which extend along the shore; but it is said not to be well kept, and to be falling into decay. It has a noble colonnade supporting a terrace facing the gardens, the whole in white marble: its interior is very richly ornamented. The emperors Charles V. and Napoleon both made this palace their residence during their stay in Genoa. Another *Palazzo Doria* is now a residence of the king of Sardinia.

There are two palaces originally belonging to the Durazzo family. That on the *Strada Balbi* is now a royal mansion; its front is about 250 ft. in length; it has a court, rich in architectural embellishments, and a famous gallery 100 ft. long, ornamented with frescoes, and containing a curious collection of statues and sculptures ancient and modern, numerous portraits of the Durazzi, historical paintings, and others by Carlo-Dold, Titian, Vanduyck, A. Durer, Holbein, &c. In another room is the *chapel-fewer* of Paul Veronese, "Mary Magdalen at the feet of our Saviour." The other Durazzo palace is scarcely less rich; its gallery contains some fine works by P. Veronese, L. and A. Caracci, Guercino, Titian, Domenichino, several by Guido, Rubens, &c. The ancient palace of the Doges was almost wholly destroyed by fire in 1777; but the modern building, on its site, is a fine structure, and contains the city council-hall, 125 ft. by 45, and 65 ft. high. The *Genoa*, *Spicola*, *Balbi*, *Brignole*, *Carega*, *M. St. Paley*, &c. palaces are amongst the most remarkable of the others. But if the palaces of Genoa be superior to those of Rome, its churches are generally inferior; though some of them would be beautiful, if less profusely ornamented. That of the *Annunziata*, founded in the 13th century, is the finest, and contains some good paintings. The cathedral or church of St. Lorenzo, built in the 11th century, is of Gothic architecture; its exterior has a strange appearance from being cased with black and white marble in alternate horizontal stripes. The church of St. Carlo, the old cathedral, is very ancient; that of St. Stefano has a famous altar-piece, the joint work of Raphael and Julio Romano. The church of *San Filippo Neri*, and the chapel of the Carmelite nuns, are both greatly admired for their chaste style. The church of *Santa Maria Carignano* is also a structure in the best taste, erected by one of the princely citizens of Genoa; whose son, in the 16th century, united two elevated parts of the town by a bridge, the *Ponte di Carignano*, 100 ft. in height, and

which passes, "with three giant strides, over houses six stories high, that do not come up to the spring of the arches." (*Simond*, p. 388.) There are said to be, altogether, 32 par. churches, and 69 convents and monasteries. There are 2 large hospitals richly endowed; the principal of which, the *Albergo di Poveri*, is a large quadrangular edifice immediately N. the inner city walls. In this institution 1,500 or 1,600 individuals, orphans and old people, are provided for; the children are brought up to different trades, and some otherwise educated; at a proper age, they are allowed half the produce of their labour, with which they in part provide for themselves. The establishment is generally well conducted; the building is handsome, spacious, and clean; it contains numerous busts and statues of its benefactors, and a "Dead Christ," in *alto rilievo*, by Michael Angelo; probably the finest piece of sculpture in Genoa. Among the other chief public buildings, are the exchange, the old bank of St. George, and one of the three theatres, — that of *Carlo Felice*, recently built. The opera in Genoa is said to be indifferent. The university in the *Strada Balbi* (founded in 1812) is a fine edifice, and has a large library and botanic garden; but it is not otherwise remarkable. Around the port is a rampart, affording an excellent promenade. On the N. side of the harbour is the *Darsena*, a double basin enclosed by piers, and destined for a refitting dock; adjoining it is the arsenal.

From the centre of the city, several quays and jetties stretch into the port, bounded on the S.E. by the old mole, projecting into the sea W. by S. about 280 fathoms; it has a battery near its middle. The new mole, on the W. or opposite side of the port, adjoins the S. extremity of the suburb of S. Pietro d'Arena, and projects from the shore E.S.E. about 210 fathoms. The mole heads bear from each other N.E. by E. and S.W. by W., the distance between them, forming the entrance to the harbour, being about 350 fathoms. A conspicuous lighthouse is erected without the port on its W. side, on a high rock at the extremity of a point of land contiguous to the bottom of the new mole. There is no difficulty in entering the harbour; the ground is clean, and there is plenty of water, particularly on the side next the new mole; care, however, must be taken, in coming from the W., to give the light-house point a good offing. Moderate sized merchantmen commonly anchor inside the old mole, contiguous to the *porto-franco*, or bonded warehouses. Men-of-war, and the largest class of merchantmen, may anchor inside the new mole, but they must not come too near the shore. Ships sometimes anchor without the harbour, in from 10 to 25 fathoms, the lighthouse bearing N. $\frac{1}{2}$ W., distant 2 or 3 m. The S.W. winds occasion a heavy swell, but the bottom is clay, and holds well. Public fountains are few in Genoa, but the city is well supplied with water brought by an aqueduct from the little river Bisagno immediately E. of the outer walls. The atmosphere is pure; and the climate of the city and its neighbourhood is healthy, and appears to be particularly favourable for the rearing of silkworms.

Genoa is the entrepôt of a large extent of country; and her commerce, though inferior to what it once was, is very considerable, and has latterly been increasing. She is a free port; that is, a port where goods may be warehoused, and exported, free of duty. The exports consist partly of the raw products of the adjacent country, such as olive oil (an article of great value and importance), rice, fruits, cheese, rags, steel, argol, &c.; partly of the products of her manufacturing industry, such as silks, damasks, and velvets (for the production of which she has long been famous); thrown silk, paper, soap, works in marble, alabaster, coral, &c.; the printed cottons of Switzerland, and the other products of that country, and the W. parts of Lombardy, intended for the S. of Europe, and the Levant; and partly of various foreign products brought by sea, and placed in *porto franco*. The imports principally consist of cotton and woollen stuffs; cotton wool, mostly from Egypt; corn from the Black Sea, Sicily, and Barbary; sugar, salted fish, spices, coffee, cochineal, indigo, hides, iron, and naval stores from the Baltic; hardware and tin plates from England; wool, tobacco, lead (principally from Spain), wax, &c. Corn, barilla, Gallipoli oil, cotton, valloons, sponges, galls, and other products of the countries adjoining the Black Sea, Sicily, the Levant, &c., may in general be had here, though not in so great abundance as at Leghorn. The various duties and custom-house fees formerly charged on the transit of goods through Genoa and the Sardinian territories have recently been abolished. This will have a very beneficial influence on the trade of this port, particularly as regards the importation of raw cotton for Switzerland and Milan, as well as of the different descriptions of colonial produce.

The bank of St. George, in Genoa, was the oldest bank of circulation in Europe, having been founded in 1407. It was conducted by a company of shareholders; and having gradually advanced immense sums to the govern-

ment, a large proportion of the public revenue was assigned to it in payment of the interest. On the invasion of Genoa by the Austrians, in 1746, a part of the treasure of the bank was carried off. Finally, on the union of Genoa with France, the bank was suppressed; the government of France becoming responsible for an annual dividend of 3,400,000 Genoese livres payable to its creditors.

Genoa is the residence of a general-commandant, and an archbishop, and the seat of the superior judicial court for the prov., an admiralty-council, and a tribunal and chamber of commerce. It has a royal college; a naval school, the first established in Italy; an excellent deaf and dumb establishment; a public library, with 50,000 vols. and 1,000 MSS. (*Dict. Geog.*); several learned societies, and various schools; though education is said not to be very generally diffused. House rent is cheap, and provisions good; beggars are fewer than in many other large Italian cities; the tone of society is said to be agreeable; and Genoa, with a few drawbacks, is considered by most travellers a desirable place of residence. Most ladies wear the *mantilla*, a piece of thin white muslin, or gauze, which covers the head and shoulders, and comes down to the waist. This piece of costume is also in common use at Leghorn, and Civita Vecchia.

Genoa is of great antiquity. After a variety of vicissitudes she became, in the 11th century, the cap. of an independent republican state; and was early distinguished by the extent of her commerce, and by her settlements and dependencies in various parts of the Mediterranean and of the Black Sea. Their conflicting pretensions and interests involved the Genoese in long-continued contests with the rival republics of Pisa and Venice. The struggle with the latter, from 1376 to 1382, is one of the most memorable in the Italian annals of the middle ages. The Genoese having defeated the Venetians at Pola, penetrated to the lagoons which surround Venice, and took Chioggia. Had they immediately followed up this success, the probability is that they would have taken Venice; but having procrastinated, the Venetians recovered from the consternation into which they had been thrown, and the Genoese were ultimately compelled to retire. The ascendancy of Venice dates from this epoch. (*Koch, Tableaux des Révolutions*, i. 263.)

The government of Genoa was long the most turbulent that can be imagined, and the city was agitated by continual contests between the nobility and the citizens, and between different sections of the nobility. The mischiefs arising from these struggles were such, that to escape from them, the citizens not unfrequently called in the aid of foreigners; and placed themselves, at different periods, under the protection of France, the Marquis of Montserrat, and the dukes of Milan. Indeed, from 1464 down to 1528, Genoa was regarded as a dependency of the latter. In the latter year, however, it recovered its independence; and was, at the same time, subjected to a more aristocratical government. But the republic continued to be agitated by internal dissensions down to 1576. At that period further modifications were made in the constitution, after which it enjoyed a lengthened period of tranquillity. (A very full account of the revolutions of Genoa is given in the *Modern Universal History*, xxviii. 353—383; see also *Sismondi, Républiques Italiques*, *passim*.)

The conquest of Constantinople, and of the countries round the Black Sea by the Turks, and the discovery of the passage to India by the Cape of Good Hope, proved destructive of a great part of the trade of Genoa. She was, also, successively stripped of all her foreign possessions. Corsica, the last of her dependencies, revolted in 1730, and was ceded to France in 1768. In 1797 Genoa was taken by the French. After the downfall of Napoleon, the congress of Vienna, in 1815, assigned Genoa and the adjacent territory to the king of Sardinia, of whose dominions they now form a part.

GEORGIA (*Pers. Gurjistan*, Russ. *Grusia*, an. *Iberia*), a country of W. Asia, and formerly the centre of a monarchy of some extent, but now a government of the Russian empire. It occupies a considerable portion of the isthmus, between the Black Sea and Caspian; extending from lat. 40° to 49° 30' N., and long. 42° 30' to 46° 30' E.; separated on the N. by the central chain of the Caucasus from Circassia; E. by the Alazan and Kizil, two tributaries of the Kur, from Shekhi and Gulistan; S. and S.W. by the Kapan mountains from Armenia; and W. from Imeritia, by a transverse Caucasian range. Thus surrounded on three sides by mountain ranges, Georgia is in a great measure shut out from communication with the neighbouring countries, there being but one pass either across the Caucasus into Circassia, or across the W. range into Imeritia. (*See CAUCASUS*, pp. 567, 568.) The length of Georgia N.W. to S.E., measured on the best maps, is about 176 m.; its average breadth from 100 to 110 m., and the pop. has been estimated at about 18,000 sq. m., and the pop. at between 300,000 and 400,000.

The surface is mostly mountainous, consisting of

table-lands and terraces, forming a portion of the S. and more gradual slope of the Caucasus. The country, however, slopes from the S. and W., as well as the N., to the centre and S.E., which are occupied by the valley of the Kur, an undulating plain of considerable extent and great fertility. Between the mountain ranges there are also numerous fertile valleys covered with fine forests, dense underwood, and rich pasturages watered by an abundance of rivulets. All the rivers have more or less an E. course. The principal is the Kur, or Mtiwari (an. *Cyrus*). This river rises in the range of Ararat, a little N.W. of Kars. It runs at first N., and afterwards N.E. to about lat. 40° N., and long. 44° E., from which point its course is generally S.E. to its mouth, on the W. shore of the Caspian. It is in many places of considerable breadth, and sometimes several fathoms deep; but its great rapidity prevents its being of much, if any, service for navigation; and only rafts are used upon it. Its principal affluents are the Aragwi from the N., which unites with it at Mtskethi, the ancient capital of Georgia, and undoubtedly the *Agathene* of Strabo, about 10 m. N.W. Tiflis; and the Aras (an. *Araxes*) from the S., which joins it not far above its mouth, where its course deflects southward. Tiflis, the cap. of Georgia, is situated on the Kur.

The climate of Georgia of course varies greatly, according to elevation; it is, however, generally healthy and temperate, being much warmer than that of Circassia, or the other countries on the N. slope of the Caucasus. The winter, which commences in Dec., usually ends with Jan. The temperature at Teflis, during that season, is said not to descend lower than about 40° Fahr.; and in the summer the air is excessively sultry, the average temperature at the end of July, 1830, having been, at 3 p. m., 79°, and at 10 p. m., 74° Fahr. (*Miss. Researches*, p. 124.) The soil is very fertile; and agriculture and the rearing of cattle are the chief employments of the inhab. Wheat, rice, barley, oats, maise, millet, the *hulcus sorghum* and *b. bicolor*, lentils, madder, hemp, and flax, are the most generally cultivated articles; cotton is found in a wild state, and is also cultivated.

Georgia is noted for the excellence of its melons and pomegranates; and many other kinds of fine fruits grow wild. Vineyards are very widely diffused, and the production of wine is one of the principal sources of employment. It is strong, and full-bodied, with more *bouquet* than Port or Madeira; but from having generally little care bestowed on its manufacture, it keeps badly; and casks and bottles being for the most part unknown, it is kept in buffalo-skins, smeared inside with naphtha, which not only gives it a disagreeable taste, but disposes it to acidity. Notwithstanding these drawbacks, and its extensive consumption in the country, considerable quantities are imported. Mr. Wilbraham says, that

the Georgians have the reputation of being the greatest drinkers in the world; and that, without which the labourer will not work, is four bottles; and the higher classes generally exceed this quantity; on grand occasions the consumption is incredible." (*Travels in the Caucasus, Georgia*, &c. p. 192.) According to Smith and Dwight, "the ordinary ration of an inhab. of Tiflis, from the mechanic to the prince, is said to be a *tonk*, measuring between five and six bottles of Bordeaux! The best wine costs but about four cents the bottle, while the common is less than a cent." The multiplied oppressions to which the inhab. have been long subjected, and the fertility of the soil, have gone far to extinguish all industry. The peasant thinks only of growing corn enough for the support of himself and family, and a small surplus to exchange at the nearest town for other articles of prime necessity. The plough in use is so heavy as to require six or eight buffaloes for its draught, and often double the number are used; the harrow is nothing more than a felled tree; and a great quantity of the produce is wasted owing to the corn being trodden out by buffaloes. Domestic animals of all kinds are reared; the horses and horned cattle are the best European breeds in size and beauty; and the long-tailed sheep afford excellent wool. Game, including the stag, antelope, wild boar, hares, wild goats, pheasant, partridge, &c., is very abundant; bears, foxes, badgers, jackals, lynxes, and it is said leopards, are common. The forests consist of oak, beech, elm, ash, linden, hornbeam, chestnut, walnut, and many other trees common in Europe; but they are of little or no use. The mineral products of the country, though nearly unexplored, are believed to be various; iron is plentiful on the flank of the Caucasus, and coal, naphtha, &c., are met with. The houses of the peasantry, even in the most civilized parts, are nothing more than slight wooden frames, with walls made of bundles of osiers covered over with a mixture of clay and cowdung, and a roof of rush. "A room 30 ft. long and 20 broad, where the light comes in at the door; a floor upon which they dry madder and cotton; a little hole in the middle of the apartment, where the fire is placed, above which is a copper cauldron attached

to a chain, and enveloped with a thick smoke, which escapes either by the ceiling or the door, is a picture of the interior of these dwellings." (*Maltz-Bron*.) In the houses even of the nobility, the walls are sometimes built only of trunks of trees cemented with mortar, and the furniture consists of a very few articles. The roads, except that across the Caucasus to Tiflis, which has been improved by the Russians, are in a wretched state. The vehicles in use are of the rudest kind, and all commodities, except straw or timber, are transported upon horses, mules, asses, or camels. The inhab. never ride, except on horseback. Coarse woolen, cotton, and silk fabrics, leather, shagreen, and a few other articles, are manufactured; the arms made at Tiflis have some reputation; but most of the other goods are very inferior, and only enter into home consumption.

Georgia composes one of the five Trans-Caucasian governments of Russia. Their government is wholly military; and how little soever it may square with our notions of what a government should be, it is not ill-fitted for the circumstances of the country; and there cannot be a question that its establishment has been most advantageous to the population.

The Georgian ladies have usually oval faces, fair complexions, and black hair; and though not generally reckoned handsome by Europeans, they have long enjoyed the highest reputation for beauty in the East: the men are also well formed, and handsome. (See *ante*, p. 183.) This superiority in the physical form of the Georgians, and other contiguous Caucasian tribes, and the low state of civilisation that has always prevailed amongst them, explains the apparently unaccountable fact, that these countries have been, from the remotest antiquity down to our times, the seat of an extensive slave-trade. Latterly the harems of the rich Mussulmans of Turkey, Persia, &c., have been wholly or principally supplied by female slaves brought from Georgia, Circassia, and the adjoining provinces; and they also furnished male slaves to supply the Mameluke corps of Egypt and various other bodies with recruits. In modern times the Georgians have been divided, with the exception of a few free commoners, into the two great classes of the nobles and their vassals or slaves. Previously to the Russian conquest, the latter were the absolute property of their lords, who, besides employing them in all manner of manual and laborious occupations, derived a considerable part of their revenue from the sale of their sons and daughters! Indeed, the daughters of the nobles not unfrequently shared the same fate, being sacrificed to the necessities or ambition of their unnatural parents. (*Tournefort*, ii. 303; *Missionary Researches*, p. 181.)

The Russians have put an end to this traffic; and they have also deprived the nobles of the power capably to punish their vassals, and set limits to their demands upon them for labour and other services. There cannot therefore be, and there is not, a doubt with any individual acquainted with the circumstances, that the Russian conquest has been of signal advantage to the bulk of the Georgian people. We believe, however, that the Russians are quite as much disliked by the nobles of Georgia as by those of Circassia; and those travellers who live with them, and credit their stories, will be amply supplied with tales of Russian barbarity and atrocity.

With a settled state of affairs, Tiflis might again become, as in the days of Justinian, a thoroughfare for the overland commerce between Asia and Europe. The Georgians belong to the Greek church, and since becoming subject to Russia, have been subordinate in ecclesiastical matters to a Russian archbishop at Tiflis, who has three suffragans in the Caucasus. The clergy are generally very ignorant. A high school in the capital has been recently erected into a gymnasium; and in addition to it, there are a few small schools, in which, however, very little is taught. No serf is, or at least used to be, instructed in reading, but all the nobility are more or less educated; the females of this class teach each other, and are commonly better informed than the males. The Georgian language is peculiar, differing widely from the languages spoken by the surrounding nations.

Georgia was annexed to the Roman empire by Pompey the Great, anno 65 a.c. During the 6th and 7th centuries it was long a theatre of contest between the E. empire and the Persians. In the 8th century a prince of the Jewish family of the Bagradites established the last Georgian monarchy, which continued in his line down to the commencement of the present century. The last prince, George XI., before his death in 1795, placed Georgia under the protection of Russia; and in 1802, it was incorporated with the Russian empire. (*Tournefort*; *Klaproth's Wilberham*; *Letters from the Caucasus*; *Smith and Dwight*; *Missionary Researches*.)

GEORGIA, one of the U. States of N. America, and, with the exception of Florida, the most S. territory in the Union; between lat. 30° 22' and 35° N., and long. 81° and 85° 30' W.; having N. Tennessee and a small portion of N. Carolina; N.E. and E., S. Carolina and the Atlantic;

S. Florida; and W. Alabama. Length, N. to S., 300 m.; breadth variable. Area, 58,000 sq. m. Pop. (1838) 661,702, of which 293,190 were whites, and 268,512 coloured. Along the coast lies a range of low, flat, sandy islands. The mainland for about 50 m. towards the interior is perfectly level; and, for several miles from the shore, consists of a salt marsh of recent alluvion; the whole of the flat country is intersected by swamps, which are estimated to constitute 1-10th part of the whole state. Beyond the swamps which line the coast occurs an extensive range of pine barrens, similar to those of S. Carolina. The Okefenokee swamp, 50 m. long by 30 broad, lies at some distance inland, upon the borders of, and partly within, Florida. This swamp is regularly inundated during the rainy season. At the extremity of the low country there is a barren sandy tract of rather greater elevation, which extends N. as far as the river falls, and is generally regarded as dividing the upper from the lower country. Farther N. the surface becomes gradually more hilly and broken, and the N. extremity of the state comprises some of the most S. ridges of the Appalachian mountain chain, which here rise to about 1,500 ft. above the level of the Atlantic. There are only three harbours on the coast capable of receiving vessels exceeding 100 tons burden, viz. those formed by the mouths of the rivers Savannah, Altamaha, and St. Mary's. The first of these is navigable by large ships as far as the city of Savannah, 17 m. from its mouth. Three of the principal rivers form the boundaries between Georgia and adjoining states: the Savannah rises in the S. declivity of the Appalachian mountain, and running along the N.E. border of the state, separates it from S. Carolina. The Chattahoochee has its source near that of the Savannah, runs chiefly S., and forms for a considerable distance the boundary between Georgia and Alabama. At the S.W. angle of the state it unites with the Flint, and, on its entrance into Florida, is called the Apalachicola. On the S. the St. Mary's, with a tortuous course of 110 m., forms the boundary of the state for about 80 m. The Altamaha, formed by the junction of several streams which traverse the centre of the state, falls into the Atlantic after a course of about 280 m.

Soil, for the most part, very productive. In the low country and the islands, it consists of a light grey sand, gradually becoming darker and more gravelly towards the interior; farther N. it is a black loam mixed with red earth, called the mulatto soil; this is succeeded in the more remote districts by a rich black mould of great fertility. As the elevation of the N. part of the state is estimated at from 1,300 to 1,500 ft. above the level of the islands on the coast, a difference of more than 7 degrees is estimated to exist between the mean temp. of the two extreme points. The N. parts are very healthy, the winters mild; frost and snow frequently occur, but are not severe or of long continuance. In the low country the usual tropical diseases are prevalent. Hurricanes and thunder storms frequently occur in the autumn, at which season the cultivators with their families generally remove either to the islands, or the most N. districts of the state. In the low region the thermometer usually ranges during the summer from 75° to 90° (Fahr.); but it has been known to stand as high as 102° (Fahr.).

Principal agricultural products, cotton, wheat, and other European grains, maize, tobacco, the sugar-cane, indigo, and rice. The coast islands were formerly covered with extensive pine barrens; but they now yield large quantities of sea-island cotton, which is not only far superior to that grown on the mainland, but is, in fact, superior to, and fetches a higher price than, any other description of cotton to be found in the market. (See CAROLINA, S.) Wheat and other corn are grown chiefly in the central parts, along the bottom of the rivers, and on the slopes of the hills near to their summits. The proportion of productive land is much greater in the hilly country than in the plains. The tops of the hills are mostly crowned with forests, composed chiefly of the pine, palmetto, oak, ash, sycamore, hickory, black walnut, mulberry, and cedar trees. Bears and deer inhabit the forests; alligators infest the swamps and mouths of the rivers; honey bees are very numerous in the S.

Gold has been found in considerable quantities in the N. part of the state; iron and copper exist in different parts; and there are several valuable mineral springs: good millstone is met with in the central districts. The total value of the gold transmitted to the U. S. mint at Philadelphia, from the mines of Georgia, amounted, down to 1838 inclusive, to 1,799,900 dollars; but the supply seems to be declining, and only 35,000 dollars were furnished during the last-mentioned year, being less than had been sent in any of the preceding years.

Cotton is the great staple; and rice, and tobacco, indigo, cane, timber, deer skins, and mules, form the chief exports; the sugar-cane has hitherto been cultivated mostly for home consumption only. From the distance between the N. part of Georgia and its ports, and the difficulty of communication by water, the corn and other produce of the interior have a very limited outlet.

The imports consist chiefly of manufactured goods, E. India produce, wines from the S. of Europe; butter, cheese, fish, &c. from the N. states; and slaves, especially from Virginia. The value of the exports during the year ending 30th of Sept., 1839, was \$5,638,839 doll., and that of the imports in the same year only 776,068 doll. In 1837 the state contained 50 banks, and 3 branch banks, with an estimated capital of about 11,790,573 doll. The state is divided into 76 counties: Millidgeville, near the centre, is the cap.; Savannah, Augusta, Washington, and St. Mary's, are the other chief towns.

The University of Georgia, called Franklin's College, at Athens, was founded in 1789-90. It was intended to embrace the whole system of public education in the state, including the establishment of an academy in each county; but this project has never been accomplished. It was re-organized in 1802, and possesses two edifices, a philosophical and chemical apparatus, a cabinet of minerals, a good library, and a botanic garden. Number of students in 1839, 137. There is a medical college at Augusta. The state has a school fund, and there are numerous and flourishing academies in Savannah, Augusta, and the other chief towns. Several manual-labour schools have been successfully established in different parts. A railroad 200 m. in length, between Savannah and Macon, is in course of construction; a canal 16 m. in length, from Savannah to the Ogeechee river, was completed in 1829; another, 12 m. in length, between Brunswick and the Altamaha, is in active progress. The legislature consists of a senate of 93 members, and a house of representatives of 207 members, chosen by all the citizens and inhab. of the state of full age who have resided in it for the year preceding the election, and paid taxes. The governor is elected by the people, and holds office for 2 years; the senators and representatives are chosen annually. For the administration of justice the state is divided into 10 circuits, each of which has a superior court, and a judge elected by the legislature, with an annual salary of 2,100 doll. There is an inferior court in each county, presided over by five justices, chosen by the people every four years; the justices have no salary. There are courts of oyer and terminer at Savannah and at Augusta. The militia of the state comprises 12 divisions, having, in 1838, a total number of 47,006 men. In 1839, 33 periodical publications were regularly issued in the state.

Georgia was the last settled of the present U. S. founded by the British. It was first colonized by them in 1733, in which year the city of Savannah was commenced by General Oglethorpe. It suffered much during the early period of its settlement from the incursions of the savages, and it was not until 1835 that the Cherokees, the last remnant of the Indian pop., had entirely disappeared. In 1776, it united in the struggle for independence, but continued in the occupation of the British until 1783. It has rapidly gained in importance and wealth upon the earlier established states of the Union. The state sends 9 mems. to the house of representatives, and 2 to the senate in congress. *Darby's View, &c.; Mitchell's United States; Encyc. Americana; American Almanac, 1834-40.*

GERA, a town of central Germany, principality of Rouss (younger branch), cap. of the lordship of the same name, on the Elster, 29 m. N.E. Schleitz, and 34 m. S.W. by S. Leipzig. Pop. 9,100. It is well built, is surrounded with walls, and has several suburbs. It possesses 6 public squares, a fine town-hall, 3 churches, 3 hospitals, an orphan asylum, a house of correction, a richly-endowed gymnasium with a library and cabinet of natural objects, a teachers' seminary, some good citizens' schools, evening and Sunday schools, &c. It has been long noted for its commercial activity; and has manufactures of woollen and cotton fabrics, hats, leather, tobacco, soap, oil-cloth, porcelain, and other earthenware, coaches, and other vehicles; and many cotton-printing and dyeing establishments, breweries, and brick kilns. In its immediate neighbourhood there are some greatly frequented baths. In 1780 Gera was almost wholly destroyed by fire; but it has since been laid out and rebuilt in a much better manner than previously. (*Bartholomew's Gazetteer*.)

GERACE (an. *Loeri*), an inland town of S. Italy, kingd. of Naples, prov. Calabria Ultra, cap. distr. and cant., on a hill within 4 m. of the Ionian Sea, 464 m. S.S.W. Catanzaro, and 39 m. N.N.E. Cape Spartivento. Pop. 4,000. Though rebuilt since the earthquake of 1783, its streets are narrow, mean, and filthy. It has the remains of a castle, a cathedral, 9 par. churches, an hospital, and a founding asylum; its public edifices were greatly injured by the earthquake alluded to. The ruins of its castle, demolished at a posterior period, show it to have been a fortress of great size and strength. It is said to have been built by the Saracens; and to have been capacious enough to contain a garrison of 10,000 men. The cathedral was formerly a

handsome Gothic edifice, but it is now so dilapidated that only a portion of its crypt remains available for public worship. Its ruins contain many fine marble columns, which originally belonged to the ancient city. Gerace is generally supposed to stand either upon or near the site of *Loeri Epitaphyri*, so called from its founders being Locrians, and its situation adjacent to Cape Zephyrium. This was one of the oldest, largest, and most prosperous of the Greek cities in S. Italy or *Magna Græcia*. It was mainly indebted for its prosperity and fame to its great legislator Zaleucus, one of the most illustrious of the Grecian political philosophers. Some ruins still remain to attest its former grandeur, among which are those of an aqueduct, of a celebrated Greek temple of Proserpine (sacked by Pyrrhus), and of a temple of Castor and Pollux. Locri never recovered from the injuries inflicted on her by Pyrrhus. In the second Punic war she sided with the Carthaginians; and having been conquered by the Romans she continued progressively to decline. The present town is supposed to have been founded in the 8th or 9th century. (*Switzerland*, i. 240, 4to. ed.; *Cramer's Ancient Italy*, ii. 404.)

GERMAIN-EN-LAYE (ST.), a town of France, dép. Seine-et-Oise, cap. cant., on a hill adjoining the Seine, 6 m. N. Versailles, and 9 m. W. by N. Paris. Pop. (1836) 10,634. Though laid out without any fixed rule, it is well built, and its streets are wide, and well paved. It has several large hotels, a public library with 3,900 vols., a theatre, a new corn-market, with manufactures of horse-hair goods, leather, &c.; and an active retail trade. It is, however, chiefly noted for its royal residence, originally built by Charles V. in 1370; reconstructed by Francis I.; and embellished by many succeeding sovereigns, especially Louis XIV., who added to it 5 extensive pavilions, and constructed the fine terrace which extends from it with a breadth of nearly 90 feet for a distance of 1½ m. between the forest of St. Germain and the Seine. That sovereign expended in all upon St. Germain the sum of 4,455,561 livres; but it is said that he afterwards became disgusted with, and abandoned, the palace, because he could see St. Denis, the burial-place of the kings of France, from its windows! Charles IX. and Henri II., as well as Louis XIV., were born in this palace; it was the residence of Madame de la Vallière; and James II. of England, with most of his family, passed their exile, and died in it. It is now used as barracks, and a military prison. Henri IV. constructed a palace, called the *Palais Neuf*, about 3 m. distant from the above; of this there now remains only the ruins. A castle, built here in the 11th century by King Robert, was destroyed by the English in 1346.

The Forest of St. Germain, one of the finest of its kind in France, extends N. of the town, enclosed W., N., and E. by the Seine. It is 9 m. in length by 3 m. in breadth; covers an extent of 8,865 English acres; and is traversed by roads, the aggregate length of which is said to be as much as 1,180 m. (*Hugo, art. Seine-et-Oise; Guide du Voyageur*.)

GERMANY (ST.), a bor., market-town, and par. of England, in Cornwall, hund. East, on the Tidd, near Lynher creek, 19 m. E.S.E. Bodmin, and 196 W. by S. London. Area of par., 10,050 acres (being the largest par. in Cornwall). Pop., in 1831, 2,586. The town is built on a slope, and consists chiefly of one street. The par. church, formerly conventual, and now containing an episcopal choir and prebendal stalls, is a fine old specimen of Saxon architecture, consisting of 2 aisles and a nave: the W. front has 2 towers, between which is an ancient arched doorway, the entrance to the church. The living is in the gift of the dean and chapter of Exeter. A free grammar-school and a parochial library have been founded and endowed by the Eliot family, whose seat, Port Eliot, near the church, occupies the site of the ancient priory, and is surrounded by delightful grounds watered by the Tidd. The inhab. chiefly gain their livelihood by fishing and agriculture. Previously to the Reform Act, by which it was disfranchised, this bor. sent 2 mems. to the H. of C.; the right of election was vested in the proprietors of burgage tenements; but of these there were very few, so that the mems. were, in fact, nominated by Lord St. Germans. Markets on Friday: fairs, May 28th, and August 1st, for cattle.

GERMANY (Germ. *Deutschland* or *Teutschland*; Fr. *Allemagne*; It. *Germania*, *Slavonia*). The word Germany is as uncertain in its derivation, as it is often vague and indefinite in its application. The Germans call themselves *Deutsche*, or *Teutsche*, and their country *Deutschland*. The first syllable of this name is derived by those who use this orthography from the verb *deuten*, signifying to interpret or explain; so that *Deutsche* means the people who were intelligible to one another, in contradistinction to the *Welche* (Welsh), or Celtic nations, whose language they did not understand. Those who write *Teutschland* derive the name of the country from the god *Tulsoo* or *Teut*, mentioned by Tacitus.

The Latin denomination of the country, which we have adopted, is supposed to be derived from the Roman manner of pronouncing the word *Wichmann*, which signifies soldier, — the character in which the Germans were mostly known to the Romans.

The extent of country comprised under the term Germany has varied in every century since it first became known to the Romans; but our limits preclude our attempting to lay before the reader any account of these variations, or of the growth of that complicated and peculiar system of policy under which the country was placed, at a comparatively early period.

At present Germany comprises all the countries of central Europe, and is bounded N. by Denmark and the Baltic; E. by Prussian Poland, Galicia, and Hungary; S. by the Tyrol and Switzerland; and W. by France, Belgium, Holland, and the German Ocean. Its surface is much diversified; but its mountain tracts lie chiefly in the S.E. and E., while W. and N. the land spreads in spacious sandy plains, intersected by the rivers which run in the same direction from the higher lands towards the sea. The mountains, which may be considered as a N. branch of the great Alpine system of Europe, bear no comparison with the Alps in point of height, for the loftiest summits are only 5,000 ft. high; but they occupy a great space, and diversify in so many various directions through the country, that it is difficult to trace them without the aid of a map. The *Fichtel-gebirge*, however, in the N. part of Bavaria, may be considered as the centre and nucleus of the mountains in central Germany; and from it branch, in four directions, the ranges composing the watershed that divides the rivers of the Black Sea from those of the Baltic and German Ocean.

1. The *Erz-gebirge*, diverging N.E. forms the boundary between Saxony and Bohemia, and has its scarped side S. towards the Eger. Its E. continuations, called the *Sudeten-gebirge*, join the Carpathian ridge, near the sources of the Oder and Vistula. 2. The Bohemian Forest range separates Bohemia from Bavaria. It runs S.E. about 160 m., and then turning N.E., joins the *Sudeten-gebirge*, near the sources of the March, in long. 16° 40' E. These ranges, by their re-union, enclose an elevated plain, constituting the kingdom of Bohemia, and drained by the Elbe and its branches, the Eger and Moldau. 3. The Saxonian Alps are a low range, branching off S.W. from the central point, and forming the watershed between the affluents of the Rhine and those of the Danube. S. they join the Black Forest range, the connection of which with the Alps is effected by a low chain skirting the Lake of Constance, and joining the main ridge at Mount Septimer. 4. The Thuringian range runs N.W. from the *Fichtel-gebirge*, and after a

course of 50 m., divides into two chains, one running N. into Hanover, and forming the Harz chain which divides the waters of the Weser from those of the Elbe; the other running W. under various names nearly as far as the Rhine, and separating its waters from those of the Weser and its affluents. The hills W. of the Rhine are continuations of the Vosges system. (See FRANCE.)

The rivers of Germany are many and important. The largest of these is the Danube (1,800 m. long), which rises in the Black Forest, and is navigable from Pesh to its mouth in the Black Sea. The chief tributaries of the Upper Danube are the Altmühl, the Naab, and the March, on its N. bank, rising on the S. slopes of the German mountains; and the Iller, the Lach, the Isar, and the Inn, on its S. bank, all rising in the Tyrolean Alps. The Rhine, which rises on Mont St. Gothard, flows through the Lake of Constance, and thence W. to Bâle; navigable from this place, it turns N., in which general direction it runs as far as Bingen, whence it pursues a course N.N.E. into the German Ocean. Its chief affluents, with the exception of the Moselle and the Maas, are on the E. bank: of these the Neckar, and the Main rise in the Saxonian Alps, the Lahn, the Ruhr, and the Lippe in the hills of W. Germany. The Weser is formed by the junction, at Münden, of the Werra and Fulda, which rise in the *Erz-gebirge*; its course is N. by W. till the junction of the Allar, at which point it turns N.E., and falls into the German Ocean about 40 m. below Bremen. The Elbe rises on the N. side of the plateau of Bohemia, which, after receiving the Moldau and the Eger, it leaves at Schandau, and enters the great N.W. plain of Germany, which it traverses to the German Ocean; its largest affluents from the S. are the Mulde and Saale from the *Erz-gebirge*, and its chief N. tributary is the Havel. The Oder rises on the N. side of Carpathian range, near its W. termination, and after a general N.N.W. course, and receiving many affluents, falls through the Great Haffe into the Baltic Sea. Besides these rivers, which of themselves constitute a most extensive water-system, there are numerous lakes connected with the rivers: such are the lakes of S. Bavaria and Austria, and the many sheets of water lying on the low plain of N. Germany, between the Oder and the Elbe.

The climate of Germany is far less variable than the nature of its mountain-system, and the range of latitudes in which it lies, would lead us to suppose. If the small strip of Illyria, which borders on the Adriatic Sea, near Trieste, be excepted, scarcely any diminution of warmth is observable between the southern and northern parts, as may best be seen from the following table, which is given by Berghaus:—

Names of Places.	Latitude.	Elevation above the Sea.	Mean Temperature, according to Reaumur's scale.				
			Year.	Winter.	Summer.	Cooldest Month.	Hottest Month.
Stralsund	54° 19'	Twice.	8-90	-1-10	+17-10	-5-90	+17-70

Mean	50° 0' 30"	175	8-5	-1-	+17-2	-2-7	+18-1

These results, taken along a line drawn through the middle of Germany, show the temperature of the far greater part of the countries of which it is composed; but there are warmer tracts, especially on the western fall, towards the Rhine and the sea. The same author has given another interesting survey along a line drawn

through this portion of Germany, in which a similar equality is observable in the extremes of temperature between the N. and the S.; there being only two degrees difference between the mean temperature of Vienna and that of Hamburg.

The vegetation of Germany resembles, in its general character, that of the N. of France. In the S. river valleys the vine flourishes, and walnuts, chestnuts, plums, &c. grow abundantly; but the severity of the winter injures the growth of garden-shrubs and flowering plants. Only hollies and some of the hardier species of junipers thrive, as even the rivers in the

warmest parts freeze, and the Rhine, near Mannheim, as well as the Danube, near Vienna, are usually covered with a coat of ice, notwithstanding their great breadth and the rapidity of their currents. The extreme cold of the winter, although it only lasts in all its violence, in common winters, for a few days, is rendered often very destructive, from the continuance of a less, but still

considerable, cold, which often lasts uninterruptedly for months. The thermometer usually falls once or twice in the course of the winter as low as -50° Fahr., but seldom continues at that figure during twenty-four hours successively. A few degrees below the freezing point is the temperature which frequently lasts for months together in the winter season.

The fall of rain is stated by Berghaus to be, in the four principal regions of Germany, as follows:—

In the region of the Rhine	25 in. 3^{rd} Paris meas.
Weser	25 - 4 - —
Elbe & Oder	22 - 2 - —
Danube	30 - — —

The quantity of rain which falls in summer is more than double the fall of the winter, throughout Germany. The number of rainy days averages 150, that of thunderstorms averages 19 for all Germany; but the latter are very unequally divided. The greatest number of thunderstorms is said to take place in Silesia, where the average amounts to 28 in the year. The smallest number is found in Lower Austria, where their annual number does not exceed 8. The prevailing winds are the W. and N.W.

The first Carolingian sovereigns of Germany were hereditary monarchs; but, so early as 887, the states, or great vassals of the crown, deposed their emperor, Charles the Great, and elected another sovereign in his stead. And from that remote period the emperors of Germany continued to be elected, down to our times. Several of the great vassals of the empire had thus early attained to all but unlimited power; and it consisted of vast aggregations of states of every different grade, from large principalities down to free cities and the estates of earls or counts. The federal tie by which these different states were held together was exceedingly feeble. Their interests and pretensions were often conflicting and contradictory, and they were frequently at war with each other and with the emperor. There was, in consequence, a great want of security; and the wish to repress the numerous disorders incident to such a state of things led, at an early period, to the formation of leagues among the smaller states, and the institution of secret tribunals. The privilege of voting in the election of emperor was restricted to a few of the most powerful vassals, being confined, by the Golden Bull issued by Charles IV., in 1356, to the archbishops of Mayence, Treves, and Cologne, the duke of Saxony, the count palatine of the Rhine, the margrave of Brandenburg, and the king of Bohemia. The sovereigns of Bavaria, Hanover, Hesse, &c. did not acquire a right to vote till a much later period. Most of the great offices in the empire were hereditary; and the public affairs were transacted in diets or assemblies of the great feudatories and of the representatives of the free cities. But as the diet had no independent or peculiar force to carry its decisions into effect, they were very frequently disregarded. At length, in the reign of Maximilian I., an attempt was made to introduce a more regular system of administration and a better police into the empire.

The progress and object of this change have been described as follows by Mr. K. F. Eichhorn: "A resolution was taken in the year 1500, in which a yearly assembly of the estates of the empire was not numerously attended, to transfer the authority which they exercised to a court to be established in Nuremberg, named the *Reichsregiment*. This court was to consist, under the presidency of the emperor or of his delegate, of members of all classes of members of the diet. The whole empire, with the exception of Austria, Burgundy, and the territories of the electors, who were represented by special counsellors, was divided into six circles, for the convenience of electing deputies. The circles were—Franconia, Bavaria, Upper Rhine, Lower Rhine, Westphalia, and Saxony. But this arrangement gave satisfaction to no party. For the emperor, this court was too independent, and it was too active in its proceedings to please those members of the diet who did not sit in it. It only remained assembled two years; and the diet evaded the establishment of a new court more dependent on the emperor. The division into circles was, however, found very convenient as a point of union for the members of the diet, whenever it became necessary to enforce the execution of decrees and sentences, as well as for the purpose of appointing members of the Aulic Chamber. In 1512, two new circles were, therefore, formed out of the territories of the electors (the circles of the Palatinate and Upper Saxony), and as many more out of the lands of Austria and Burgundy. Each of these six circles chose, according to ancient custom, at its meetings a captain and delegates, who arranged and conducted the public force."

As this political division was independent of the territorial subdivisions which the changes in families produced, it lasted as long as the empire itself preserved its unity as a political body; and even after the assumption of independence by the king of Prussia, that part of the kingdom of Prussia which previously formed a part of the

empire was still included, nominally, at least, in the circles to which it belonged. By their refusal to join in this arrangement of internal police, and to become amenable to the decrees of the Aulic Chamber (*Reichs-Ratsgericht*), the Swiss cantons finally severed the last tie which united them to the empire. The influence of the kings of Poland caused a similar separation between the empire and the lands belonging to the Teutonic order, on the right bank of the Vistula.

At the period of the outbreak of the French revolution, in 1789, the ten circles of Germany were subdivided into the following territories:—

- I. The circle of Austria, belonging entirely to the house of Austria.
 1. The duchy of Lower Austria.
 2. Inner Austria, or the duchies of Styria, Carinthia, and Carniola, with Friuli and the district of Trieste.
 3. Upper Austria, or the county of Tyrol, with the bishoprics of Trent andrixen.
 4. Fore-Austria, containing the Austrian Breisgau, the margraviate of Burgau, the landgraviate of Nettenburg, the city of Constance, the manors of Aharf and Ravensburg, the towns of Riedlingen, Mengen, and the lordships of Vorarlberg.
- II. The circle of Burgundy, belonging to Austria:—
 1. The duchies of Brabant, Limburg, Luxembourg, and Gueldres.
 2. The counties of Flanders, Hainault, and Namur.
- III. The circle of Westphalia, divided between clerical and lay princes:—
 1. The bishoprics of Münster, Paderborn, Liege, and Osnabrück.
 2. The abbeys of Corvey, Stablo, and Malmedy, Werden, St. Corbelle-Münster, and Münster and Herford.
 3. The duchies of Cleves (Prussian), Jülicher and Berg (to the elector palatine), Oldenburg (to the bishop of Lübeck).
 4. The principalities of Minden (Prussian), Werden (elector of Hanover), Neuen (count of Dietrichstein), Dillenburg, and Hadamar, belonging to the stadtholder of Holland; East Friesland, Mörn, and Gueldres (Prussian).
 5. The counties of Mark, Ravensberg (Hesse-Cassel and Lippe); Bentheim, Steinfurt, Hoya, and Diepholz (Hanover and Cassel); Meiningen (Prince Kaunitz); Pyrmont (Count Waldeck); Wildeshausen, Völsingen, Spiegelberg, Grunfeld, Reckheim, Molzappel, Blankenheim and Geroldstein, Kerpen, Lohmar, Schielden, Hallermund.
 6. The lordships of Anhalt, Witten, Winneberg and Heilsenstein, Gommern, Glinzow and Nebelsdorf, Wickerad, Myndrich, Reichenstein.
 7. The free imperial cities Cologne, Aix-la-Chapelle, and Dortmund.
- IV. The circle of the Palatinate, divided between one lay and three clerical princes:—
 1. The electorate of Mayence, the archbishop of which ranked as the first elector and primate of the German empire. The electorate consisted of the archbishopric of Mayence, the city of Erfurt, the district of Bachfeld, and of the town and district of Fritlar.
 2. The electorate and archbishopric of Treves.
 3. The archbishopric of Cologne and the duchy of Westphalia, which constituted the electorate of Cologne.
 4. The palatinate of the Lower Rhine.
 5. The principalities of Arenberg.
 6. The landgraviate of Coblenz (Teutonic order).
 7. The lordship of Helldorf.
 8. The burgraviate of Isenach.
 9. The county of Lower Isenach.
- V. The circle of the Upper Rhine, divided amongst a number of territorial lords, the most powerful of whom was the landgrave of Hesse-Cassel:—
 1. The bishoprics of Worms, Spire, Strasbourg, Basle, and Friburg.
 2. The abbey of Weissenburg.
 3. The principality of Hildesheim.
 4. The abbeys of Irmin and Odenheim.
 5. The principalities of Simmern, Lautern, Veldenz, and Deuxponts.
 6. Landgraviate of Hesse, in two lines, Cassel and Darmstadt.
 7. Principality of Hunsrück (Hesse-Cassel).
 8. The county of Sponheim (Palatinate and Baden-Baden), Salm and Nassau; Alsdorf, Hunsrück-Bismberg, Solms, Könnigstein (elector of Mainz and Count Stol.); Upper Isenach; the possessions of the count of the Rhine and the landgrave, viz. the county of Halm, the lordship of Grumbach, &c. the counties of Hungen, Wittgenstein, Falkenstein (belonging to the emperor), Neipoltskirchen, Krieselringen, Wetzlar.
 9. The lordships of Lichtenberg, Breitenbach, Dachsuhl, and Olfersbach.
 10. The free imperial cities Worms, Spire, Frankfurt-on-the-Main, Friburg, and Wetzlar.
- VI. The Saxon circle. Amongst the many princes of this circle, the duke of Württemberg and the margrave of Baden were the most powerful:—
 1. The bishop of Constance and Augsburg.
 2. The abbeys of Ellwangen, Kempten, Lindau, and Buchau.
 3. The duchy of Württemberg.
 4. The margraviate of Baden.
 5. The principalities of Hohenzollern (Hechingen and Sigmaringen).
 6. The county of Thengen, the counties of Heiligenstadt and Boar (prince of Fürstberg), lordships of the princes and counts of Oetting, the landgraviate of Kleinfeld (Prince Schwarzenberg), and the principality of Lichtenstein.
 7. The domains of 17 abbots and 4 abbesses.
 8. The lordships of 18 counts and barons.
 9. Thirty-one free imperial cities: viz., Augsburg, Ulm, Esslingen, Reutlingen, Nördlingen, Schwäbisch Hall, Uerdingen, Reutlingen, Heilbrunn, Heilbrunn, Murrhardt, Ludau, Dinkelsbühl, Eberbach, Ravensburg, Kempten, Kaufbeuren, Weißenburg, Wangen, Isny, Leutkirch, Wangen, Gengen, Pfaffenhofen, Buchhorn, Aalen, Bopfingen, Buchau, Oeffelburg, Gengenbach, and Zoll-am-Hammersbach.

VII. The circle of Bavaria, in which the elector of Bavaria and the bishop of Salzburg took the lead:—

1. The archbishop of Salzburg.
2. The bishoprics of Freising, Ratibos, and München.
3. The abbies of Tegernsee, and
4. Meder and Ober-Münster.
5. The duchy of Bavaria, with the Upper Palatinate.
6. The principality of Neuburg and Sulzbach.
7. The landgraviates of Leuchtenberg and Bismarck.
8. The counties of Haag and Ortenburg.
9. The lordships of Ehrenfels, Halsburg, Pymbaum, Hohenwaldsee, and Breitensee.
10. The free imperial city of Ratisbon (Regensburg).

VIII. The circle of Franconia included—

1. The bishoprics of Bamberg, Würzburg, and Eichstätt.
2. The master of the Teutonic order's territories at Mergentheim (Deutschmeister).
3. The principalities of Baireuth and Anspach.
4. The counties of Henneberg and Schwarzburg.
5. The principality of Hohenlohe.
6. The counties of Castell, Wertheim, Rieneck, and Erbach.
7. The lordships of Limburg, Seinsheim, Reichelsberg, Wiesentheid, Weisheim, and Hausen.
8. The free cities, Nürnberg, Nuremberg-on-the-Tauber, Windolstein, Schweinfurt, and Weissenburg.

IX. The circle of Lower Saxony:—

1. Duchy of Magdeburg (Prussia).
2. Duchy of Bremen, principalities of Lüneburg, Grubenhagen, and Kalenberg (elector of Hanover).
3. Duchy of Wolfenbüttel, principality of Blankenburg.
4. Principality of Halberstadt (Prussia).
5. Duchy of Mecklenburg-Schwerin and Stralsund.
6. Duchy of Holstein, with the county of Ratzeburg, and the lordship of Pinneberg (king of Denmark).
7. The bishopric of Hildesheim.
8. The duchy of Saxe-Lauenburg (Brunswick).
9. The bishopric of Lübeck.
10. The principality of Schwerin (duke of Mecklenburg-Schwerin).
11. The principality of Ratzeburg (duke of Mecklenburg-Schwerin).
12. The free imperial cities, Lübeck, Hamburg, Bremen, Goslar, Mühlhausen, and Naumburg.

X. The circle of Upper Saxony:—

1. The duchy of Pomerania (of which that part beyond the Preme belonged to Sweden, the remainder to Prussia).
2. The mark of Brandenburg (belonging to the king of Prussia).
3. The principality of Anhalt, divided amongst four princes:—Desau, Bernburg, Zerbst, and Köthen.
4. The electorates of Saxony (Saxon-Albertine line).
5. Principalities of Weimar, Eisenach, Coburg-Gotha, Altenburg (dukes of Saxony), of the Ernestine line.
6. The abbey of Quedlinburg.
7. The county of Schwarzburg (Sondershausen, and Rudolstadt), Mansfeld (Prussia and Hesse), Stolberg, and Verneburg.
8. The lordships of Renss and Schönbürg and the county of Hohenstein.

The Slavonic countries, which were not included in any circle, were—

- The kingdom of Bohemia.
- The margraviate of Meissen.
- The duchy of Silesia, so far as it was Austrian, the margraviates of Upper and Lower Lusatia, the duchy of Silesia (Prussian), and the county of Glatz.
- The lands held directly of the emperor, and not included in any circle, were—
- The counties of Mumpelgard and Hornburg.
- The lordships, Asch, Leisnig, and Meissen, Rheda, Jever, Dyck, Schöna, Wythe, Reichold, Stein, Dreyse, Landkron, Rheda, Naffenberg, Schaumburg, Oberstein, Schauen, Kniphausen, and Hörden.
- The abbies and convents, Elten, Kappenberg, and Burscheid.
- The free imperial towns, Alchenhausen in Buxia, Althausen in Franconia, Sulzbach and Roden near Frankfurt-on-the-Maine, with the free towns on the banks of Leutkirch.

Such were the territorial divisions of the German empire at the period of the outbreak of the French revolution; according to Berghaus, from whom the following statements are likewise taken:—

Every circle had its diet, in which the clerical and secular princes, the prelates, the counts and barons, and the free imperial cities, formed five benches or colleges.

Affairs of general importance to the empire at large were treated by the imperial diet, which the emperor had the power of summoning wherever he pleased; but which, since 1653, has been constantly assembled at Ratisbon. In 1789, the members of the diet were as follows:—

1. The college of electors: Mayence, Trèves, Cologne, the Palatinate, Brandenburg, Saxony, Bavaria (since 1635), and Brunswick-Lüneburg (since 1693).

2. The college of the clerical and secular princes, bishops, margraves, counts, &c.; the numbers of the clerical members being 36, and of the secular lords, 63.

3. The college of the free imperial cities, then 54 in number.

In 1791, began the memorable contest with revolutionary France, which ended in the overturn of the old Germanic constitution, which was tottering with age and too far gone in decay to bear regeneration. The treaty of Campo Formio, the first that history records in which the Rhine was acknowledged as the frontier of France, decreed an indemnification to those princes who lost by the cession and this indemnification could only be obtained by the spoliation of some others whose rights were equally indefeasible, in the heart of the empire itself. On the 25th of January, 1803, a decision was come to by the plenipotentiaries assembled for the arrangement of this matter, the import of which was as follows:—

The Holy Roman Empire, as that of Germany was styled, remained as it was divided into circles, but which, with the total loss of the circle of Burgundy, and of the lands on the left bank of the Rhine, were reduced to nine, whose boundaries it was proposed to regulate anew. This regulation was, however, prevented by the wars which so quickly succeeded each other. The right to

sit and vote in the diet remained, as formerly, attached to territories held directly as fiefs of the empire; and the place of the convocation of the diet remained at Ratisbon. The colleges remained also three in number; the first being the College of Electors, who were ten in number; one clerical,—the elector archchancellor; and nine secular,—Bohemia, Bavaria, Saxony, Brandenburg, Brunswick-Lüneburg, Salzburg, Wirtemberg, Baden, and Hesse-Cassel. The electorate of Mayence had merged into that of the archchancellor, and the Palatinate into the electorate of Bavaria; Trèves and Cologne had disappeared, and four new electorates had been created.

The second College—of Princes—counted 131 votes.

The College of Towns was composed of six with votes: Hamburg, Lübeck, Bremen, Frankfurt-on-the-Maine, Augsburg, and Nuremberg. The other territories, enumerated above as not being included within the circle, remained as they were, nor did any change take place in the extent or position of the Slavonic countries.

Berghaus gives the following comparative statement of the extent of the empire and of its circles before the year 1799, and in 1803, shortly before it was finally dissolved.

Circles and Districts.	Area, in Germ. sq. m.		Population.	
	1791.	1803.	1791.	1803.
Austrian circle	2,145	2,438	4,500,000	4,932,000
Burgundian do.	469	—	1,850,000	—
Westphalian do.	1,250	825	2,360,000	1,885,000
Palatinate do.	458	—	1,000,000	—

Napoleon, who, since 1799, had directed the foreign policy of the French, not satisfied with this reduction of the power of the empire, now conceived the design of effecting its final dissolution. The treaty of Presburg, in 1805, which followed the battle of Austerlitz, gave him the means of carrying this project into effect, by forming a confederation of German princes, called the Confederation of the Rhine, who, uniting into a corporate body, in 1807, placed themselves under the protectorate of the emperor of the French. The wars which followed, with Prussia, in 1807, and with Austria, in 1805, gave Napoleon the power of altering the territorial distribution of Germany at pleasure. He accordingly created for his brother Jerome the new kingdom of Westphalia, and for his brother-in-law Joachim Murat, the grand duchy of Berg, and raised those members of the Confederation of the Rhine who supported his cause to new dignities and an openly recognised independence as sovereigns. Under these circumstances, the emperor, Francis II., by a solemn act, renounced the style and title of Emperor of Germany, on Aug. 6, 1806. In the following year, Napoleon incorporated the coats of the German Ocean with the French empire, and divided them into departments; thus separating from Germany a district peopled by more than 1,100,000 inhab. It might have been expected that the ancient distinction, to which allusion has before been made, between high and low German countries, would, on this occasion, have been made the basis of new political divisions; but the circumstance seems to have been altogether overlooked, and can, at most, only explain the indifference with which the people of the north of Germany allowed themselves to be transferred from one hand to another.

The extent of the confederate states, united under the protectorate of Napoleon in 1811, is given by Berghaus as follows:— [See top of following page.]

The termination of the war with Russia, or, as it is called in Germany, "the war of liberation," restored Germany to its geographical and political position in Europe, but not as an empire acknowledging one supreme head. A confederation of 35 independent sovereigns and 4 free cities has replaced the elective monarchy, that fell under its own decrepitude. In the choice of the smaller princes, who were to become rulers, as well as of those who were obliged to descend to the rank of subjects, more attention was paid to family and political connection than to the old territorial divisions under the empire. The clerical fiefs, and the greater part of the free imperial cities, were incorporated into the states of the more powerful princes, upon the dissolution of the empire, and were not re-established. Only four cities remained in the enjoyment of their political rights.

The signing and ratification of the Act of Confederation took place, after long discussion, on 8th June, 1815. The following are the principal stipulations of the treaty.

1. The sovereigns and free cities of Germany, including their majesties the emperor of Austria, and the kings of Prussia, Denmark, and the Netherlands; the emperor and king of France, for the whole of their territories, formerly belonging to the German empire; the king of Denmark, the king of the Netherlands, for Luxembourg, agree to unite to form an eternal league, to be denominated the German Confederation (der Deutsche Bund).
2. The object of this confederation is the maintenance of the security of Germany, internally and externally, and the assertion of independence and integrity of the respective Germanic states.
3. All members of the confederation have, as such, equal rights. They all bind themselves equally to observe inviolably the act of union.
4. The affairs of the confederation are managed by the diet, in which every member is represented, either by a separate or by a joint vote, in the order of the annexed list, but without prejudice to the rank of the sovereigns. In the committee, the members are represented by 17 electors.
5. A member enjoys the right of proposing in the diet. Every member of the diet has the right of making propositions, and of bringing forward measures for discussion; and the president is bound to submit them to consideration within a certain term, to be hereafter fixed.
6. Propositions relating to the adoption or alteration of the fundamental laws of the confederation, or which concern its organization, or the extension of the confederation in any way to be generally advantageous to the members, must be submitted to a full assembly of the diet, in which every individual member has one or more votes, according to the size of each state.

It remains a matter for future discussion whether any joint vote shall be allowed to the mediatised nobles of the empire, which shall be considered when the organization of the diet is under consideration.

7. The committee decides by a majority of votes in how far a subject is adapted for the consideration of the full assembly.

The propositions to be subjected to the decision of the full diet must be referred and brought to maturity in the committee. The decision in both assemblies is by a majority of votes, but in the plenum, the majority must amount to two thirds of the votes.

When the votes are equally divided in the committee, the president has the casting vote.

But where the adoption or alteration of fundamental laws is concerned, or the rights of individual members, or in religious matters, no resolution can be adopted by the committee alone, nor can the full assembly decide by a mere majority of votes.

The committee of the diet is constantly assembled, but may adjourn its sittings when the affairs that have been submitted to its consideration are disposed of.

8. Respecting the order in which the votes of the members are collected, no discussion shall take place during the organization of the diet, nor shall any accidental order which may arise during this period be prejudicial to the rights of the members, or be considered as establishing a precedent.

When the organization of the league is concluded, the diet will take up the question of precedence for diplomatic arrangements, and will then adhere as closely as possible to the usage of the former diet of the empire, but especially to that fixed by the decree of the imperial deposition (of 1813). But this order of voting is to have no influence in the election of the individual members, nor upon their order of precedence, on other occasions than that of voting in the diet.

9. The place of assembly for the diet is Frankfurt-on-the-Maine.
10. The first subject which shall take up the attention of the diet

upon its opening must be the drawing up of the fundamental laws of the confederation, and its organization in respect to its relations with foreign powers, its military and internal arrangements.

11. All the members bind themselves for the protection of Germany against the attacks of any foreign power, as well as for the security of each individual state; and guarantee to each other mutually the possessions of each state which are comprehended within the confederation.

When war has been declared by the confederation, no member of the confederation can enter into separate negotiations with the enemy; nor can separate truces or treaties of peace be concluded by individual members.

The members of the league reserve to themselves the right of making alliances of every kind, but bind themselves not to enter into any which could be prejudicial to the security of the confederation, or of any of its members.

12. The members further bind themselves under no pretence to declare war against one another, nor to pursue their mutual differences by force of arms, but engage to submit them to the diet.

The diet is in such cases competent to attempt a reconciliation, by the appointment of a select committee, and should this not prove successful, to procure a decision from a well-organized court of arbitration, whose sentence is implicitly binding upon the disputing parties.

13. In all the states of the confederation, a constitution based on representation by estates shall be introduced (*Landständische Verfassung*).

The labours of the committee for the organization of the confederation having terminated and received the approbation of the diet, a further and more detailed declaration of the objects of the league, as well as of the mode of conducting the affairs of the confederation, was published on the 15th May, 1830. This document, together with the original act, as given above, and the resolutions of the diet, principally relating to affairs of internal police, published in 1832, may be regarded as the fundamental laws of the confederation.

Since the publication of these decrees, some modifications have taken place in the territorial divisions of the confederated states. Saxo-Gotha — has been taken from the list, in consequence of the extinction of the reigning house and the division of its territories amongst the other Saxon houses. A new member has been admitted, in the landgrave of Hesse-Homburg, and an exchange has taken place of a portion of the grand duchy of Luxembourg, ceded to Belgium, for an equal portion of the duchy of Limburg, which that power gave up to Holland. In the preceding table, these alterations are noted, and the number of votes is annexed which each power has in assemblies of the full diet, and in the standing committee, which annually assembles at Frankfurt.

German Customs' League. — Until a very recent period, every one of these states into which Germany is divided had its own custom-houses, and its own tariff and revenue laws; which frequently differed very widely indeed from those of its neighbours. The internal trade of the country was, in consequence, subjected to all those vexatious and ruinous restrictions that are usually laid on the intercourse between distant and independent states. Each petty state endeavoured either to procure a revenue for itself, or to advance its own industry, by taxing or prohibiting the productions of those by which it was surrounded; and customs' officers and lines of custom-houses were spread all over the country! Instead of being reciprocal and dependent, every thing was separate, independent, and hostile: the commodities admitted into Hesse were prohibited in Baden, and those prohibited in Württemberg were admitted into Bavaria. It is admitted on all hands that nothing has contributed so much to the growth of industry and wealth in Great Britain, as the perfect freedom of internal industry we have so long enjoyed, and that intimate correspondence among the various parts of the empire, which has rendered each the best market for the products of the other. How different would have been our present condition had each county been an independent state, jealous of those around it, and anxious to exalt itself at their expense! But, until within these few years, this was the exact condition of Germany; and, considering the extraordinary obstacles such a state of things opposes to the progress of manufactures, commerce, and civilisation, the wonder is, not that they are comparatively backward in that country, but that they should be so far advanced as they really are.

But, thanks to the intelligence and perseverance of Prussia, this selfish anti-social system has been well nigh suppressed; and the most perfect freedom of commerce is now established among the great bulk of the Germanic nations. The disadvantages of the old system had long been seen and deplored by well-informed men; but so many interests had grown up under its protection, and so many deep-rooted prejudices were enlisted in its favour, that its overthrow seemed to be hopeless, or, at all events, exceedingly distant. The address and resolution of the Prussian government have, however, triumphed over every obstacle. Being fully impressed with a strong sense of the many advantages that would result to Prussia and Germany from the introduction of a free system of internal intercourse, they pursued the measures necessary to bring it about with an earnestness that produced conviction, and with a determination, *cœcæ qui cœcæ*, to carry their point.

The first treaties in furtherance of this object were negotiated by Prussia with the principalities of Schwarzburg-Sonderhausen and Schwarzburg-Rudolstadt, in 1818 and 1819, on the principle that there should be a perfect freedom of commerce between these countries and Prussia; that the duties on importation, exportation, and transit, in Prussia and the principalities, should be identical; that these should be charged along the frontier of the dominions of the contracting parties, and that each should participate in the produce of such duties in proportion to its population. All the treaties subsequently entered into have been founded on this fair and equitable principle; the only exceptions to the perfect freedom of trade in all the countries comprised within the league or tariff alliance being confined, 1st, to articles constituting state monopolies, as salt and cards, in Prussia; 2d, to articles of native produce, burdened with a different rate of duty on consumption in one state from what they pay in another; and, 3d, to articles produced under patents, conferring on the patentees certain privileges in the dominions of the states granting the patents. With these exceptions, which are not very important, and are daily decreasing, the most perfect freedom of commerce exists among the allied states.

Since 1818, when the foundations of the alliance were laid, it has progressively extended, till it now comprises more than four fifths of the Germanic states, exclusive of Austria. Ducal Hesse joined the alliance in 1838, and electoral Hesse in 1831; the kingdoms of Bavaria, Saxony, and Württemberg joined it afterwards, as have Baden, Nassau, and almost all the smaller states by which it had not been previously joined, with the exception of Hanover, Mecklenburg-Schwerin, Mecklenburg-Strelitz, Oldenburg, and Brunswick.

Throughout the whole extent of this immense country, from Aix-la-Chapelle, on the confines of the Netherlands, eastward to Tilsit, on the confines of Russia, and from Stettin and Danzig, southwards, to Switzerland and Bohemia, there is nothing to interrupt the freedom of commerce. A commodity, whether for consumption or transit, that has once passed the frontier of the league, may be subsequently conveyed, without let or hindrance, throughout its whole extent. Instead of being confined within the narrow precincts of their own territories, the products of each separate county, the alliances may now be sent to every one else; each will, in consequence, apply itself, in preference, to those departments in which it has some natural or acquired advantage; and each will have to depend for its success, not on the miserable resource of customs' regulations, but on its skill and industry. The competition thence arising will be most salutary; and, should the peace of Europe be preserved, we run little risk in saying, that all sorts of industry will make more progress among the states comprised within the tariff alliance, during the next ten years, than they have done during the previous half century.

An assembly of representatives from the allied states meets annually, to hear complaints, adjust difficulties, and make such new enactments as may seem to be required. The Prussian tariff has been adopted, with certain modifications, and is now the only one in force. The duties are received into a common treasury, and are apportioned according to the population of each of the allied states. In addition to its other advantages, the new system has reduced the cost of collecting the duties to a mere trifle, compared with its former amount; and has enabled hundreds of custom-houses, and thousands of customs' officers, to be employed in the different departments of industry.

The existing discrepancy in the weights and measures used in different parts of Germany occasions considerable inconvenience; and we are glad to observe that the equalisation of weights and measures, and their reduction to a common standard, in all the allied states, is declared to be one of the objects of the league.

It is also expressly provided, that the tolls, or other charges in lieu thereof, shall, in all cases, whether they belong to the public, or to private individuals, be limited to the sums required to keep the roads in a proper state of repair; and that the tolls existing in Prussia shall be considered as the highest that are to be levied, and shall not in any case be exceeded.

It was at first supposed by many persons in this country, and the opinion is not yet entirely abandoned, that the Prussian league was in some degree directed against us, and that, at all events, it threatened to be very injurious to our trade with Germany; we do not, however, believe that there is any foundation whatever for either of these opinions. The alliance was planned, and brought to its present advanced state, in the view, and with the intention, of putting down the galling and innumerable restraints by which the intercourse of the German states with each other was formerly interrupted; and not with the intention of throwing any obstacles in the way of the trade of the alliance with foreign countries: it is, indeed, quite absurd to suppose that it should have this effect. The freedom of internal commerce will do ten

times more to promote the industry and prosperity of the allied states than any other measure, or system of measures, that their governments could have adopted; and, as population increases, and the inhabitants become more industrious and wealthy, there will, no doubt, be an augmented demand for foreign products. The league is now no new thing. It was formed several years since, and has been progressively augmented; but, hitherto, it has not had the slightest influence in diminishing our intercourse with Germany; our exports to it, including Holland and Belgium, being greater at present than at any former period! Generally speaking, the duties on imports are reasonable; at least, on all the finer descriptions of goods. It never, in fact, can be the policy of the alliance to make them oppressive; for, though certain states might erroneously suppose that their interests would be promoted by such means, others would undoubtedly be of a different opinion, and would resist any attempt to carry them beyond a reasonable amount. It is a mistake to suppose that Prussia has an overwhelming influence in the assembly. She must conciliate the other states, and carry them along with her; and this can only be done by acting on liberal principles, and with a view to the common interest of the alliance.

Besides, if any of the existing duties be exorbitant, or if any of them, that are at present moderate, should be subsequently raised to an exorbitant pitch, does any one suppose that the over-taxed articles would not be immediately smuggled into all parts of the league? We, who occupy an island, and have revenue cruisers and coast-guards on all the seas and shores most accessible to the smuggler, know from experience that it is not possible to hinder over-taxed commodities from making their way, in immense quantities, into our markets. But the facilities for smuggling into the territories of the league are incomparably greater. It has a land frontier of several thousand miles; and though the whole Prussian army were employed for that purpose, it would be found that it was utterly impotent to prevent the territories of the league from being deluged with such over-taxed commodities as were in demand by the inhabitants.

It must be admitted that we have done not a little to provoke Prussia, and that we had no reason to be surprised had she manifested symptoms of irritation. She has only three great staple articles of export—corn, timber, and wool. Now, of these, we admit only the last on anything like fair terms; in ordinary years, we entirely exclude corn, and we lay a duty of no less than 55s. a load on Prussian timber, while we admit the inferior timber of North America on payment of duty of only 10s. Had, therefore, the Prussian tariff been levelled against us, we should have had but slender grounds for complaint; but such is not really the case. It may, indeed, be fairly inferred that, by agreeing to lower the oppressive duties on timber and corn, we might prevail on Prussia to use her influence to get the alliance duties on cotton stuffs, hardware, &c. abated; but, till we consent to moderate our duties on the articles in question, it is not to be supposed that Prussia will pay much attention to the exceptions we may take to any of the duties.

We are glad to be able to strengthen our view of the influence and objects of the Prussian commercial league, by laying before the reader the following extract from a work printed by order of the House of Representatives of the American States. "Prussia," it is there said, "has evidently taken the lead in this wise and important measure, to which the smaller states have gradually acceded. The whole commercial policy of this enlightened power has been distinguished for its liberality, being founded on the desire of placing her intercourse with all nations on the basis of reciprocity. The commercial league of Prussia is intended to put out this principle, and not to be directed, as has been supposed, against any particular nation; as it is well known that Prussia, in her treaties with maritime powers, has invariably adopted the system of reciprocity, to whatever extent those with whom she negotiates are willing to carry it. The establishment of this community of commercial interests forms a part of the fundamental compact by which the new Germanic confederation was created, after the dissolution of the Confederation of the Rhine; to be subsequently adopted, however, at the option of such of the co-states as should choose to accede to it. Its effects cannot fail to promote commerce, and every other branch of industry, as it removes all those vexatious and endless difficulties which previously obstructed the freedom of intercourse. Navigable rivers and highways are now opened to the unfettered use of the German people; the customs and toll-houses, with their officers and barriers, have been withdrawn from the interior, and the whole intercommunication resembles that of the subjects of any one of the states within its own territories. To these benefits may be added the assured prospect of improvement in the finances of the great and smaller sovereignties composing the league. This advantage will grow out of the simplicity or unity of the new system, a saving

in the cost of collection, and from the increased consumption which renovated industry and progressive prosperity so invariably cause." (*Digest of Customs' Laws*, vol. iii. p. 227.)

GERONA (an. *Gerunda*), a fortified city of Spain; Catalonia, cap. corrég. of same name; on the declivity, and at the foot of a steep mountain, on the Ter, 50 m. N.E. Barcelona. Pop. 6,832. (*Milano*, 1826.) The plan of the city is nearly triangular. At the commencement of the Peninsula war, during which it suffered greatly, Gerona was an important fortress; being surrounded with old walls in good repair, and further defended by the citadel of *Monjuïc*, a square fort 720 ft. in length on each side, with bastions, outworks, &c., placed on an eminence about 60 fathoms distant, commanding the city; besides which there were four forts, with redoubts upon the high ground above it. It is still partly surrounded by walls; but *Monjuïc* is its only outwork remaining. It is now, says *Ingla*, chiefly noted for the number of its religious edifices; there are no fewer than 13 churches, besides the cathedral, and 11 convents. The principal buildings are the cathedral and the collegiate church of San Felice. The former, built on the ridge of the mountain, "displays a majestic front at the top of three grand terraces ornamented with granite balustrades. The ascent to it is by a superb flight of 81 steps, of a breadth the whole extent of the church. The front is decorated in bad taste with three orders of architecture—Doric, Corinthian, and Composite, and flanked with two hexagon towers. The interior is large and handsome; it has only a nave in the Gothic style." It contains the monuments of Raymond Berenger, count of Barcelona, and his consort. The treasury of this church afforded a rich spoil to the French, on their gaining possession of Gerona. The collegiate church is of Gothic architecture, consisting of a nave and 2 aisles divided by pillars; connected with it there is a very lofty and ancient tower. In the Capuchin convent there is an Arabian bath of elegant construction. The streets of Gerona are narrow, filthy, but clean and well paved; and the houses are tolerably well built. There are 3 squares, one of which is of considerable size; 2 hospitals, a seminary, college, with a good public library (formerly belonging to the university founded 1521 by Philip II., and abolished 1715 by Philip V.), a Beguine seminary for poor girls, and several other schools. The place wears, however, a dull and melancholy look. "The inhabitants have no theatre, no public amusements, no common rendezvous. Every one seems to live alone. One fourth of the pop. are priests, monks, nuns, and students. They carry on very little trade. The only manufactures are a few looms for weaving coarse woollens and cotton stuffs and stockings, which have been established in the asylum within the last twenty years." (*Mod. Trav.* xviii. 57.)

Gerona is the seat of a bishopric, which is richer than that of Barcelona; of an ecclesiastical tribunal; a sub-deleg. of police; and a military governor. It is of great antiquity, and formerly gave the title of prince to the son of the king of Aragon. It has sustained numerous sieges, and been famous for the brave defence it has always made; but especially for that it sustained under Mariano Alvarez, in 1809, for upwards of seven months, against the French. (*Milano*; *Dict. Géog.*; *Southerly*; *Switzerland*; *Ingla*, &c.)

GERS, a dep. of France, reg. S.W., between lat. 43° 17' and 44° 4' N., and long. 0° 18' W. and 1° 11' E.: having N. the dép. Lot-et-Garonne, E. those of Tarn-et-Garonne and Haute Garonne, S. the latter and the Hautes and Basses Pyrénées, and W. Landes. Length, E. to W., 74 m., by about 54 m. in breadth. Area, 626,399 hect. Pop. (1836) 312,982. The last ramifications of the Pyrenees cover most of this dep., the slope of which is mostly from S. to N. Rivers numerous: most of them have a S. or less a N. direction, and are affluents of the Garonne or Adour. There are many ponds and small lakes. Gers, like the neighbouring dep., is subject to violent storms; its soil is, however, in general fertile. It has 333,600 hect. of arable land, 60,800 hect. meadows, and 87,800 hect. vineyards. Agriculture is very backward, but it has been much improved of late years. Only about 2-4ths of the corn required for home consumption is raised in the dep.; it is chiefly wheat, maize, and oats. Garlic, onions, various other vegetables, hemp, fax, &c., are plentifully cultivated. Fruit is good. About 500,000 hectol. of wine are produced in ordinary years, but it is mostly of mediocre quality: about a half is consumed at home, and the other half converted into brandy, which ranks next after that of Cognac. In 1830 there were estimated to be about 388,000 sheep, and 141,350 oxen, in the dep.; considerable attention has been paid to the improvement of the breed of the former, which yield annually about 340,000 kilog. wool. Poultry are plentiful; and, as well as hogs, fattened, or killed and salted, they form an important article of trade. Manufactures unimportant: there are a few fabrics of glass and earthenware, leather, starch, linen, woollen and cotton cloth, and thread, cream of tartar, &c. The trade

is, however, chiefly in the products of the soil, with which this dep. supplies the neighbouring ones and Spain. Gerv. is divided into 5 arronds, and sends 5 mem. to the Chamber of Dep. Number of electors (1838-39), 3,108. Chief towns, Auch, the cap., Condom, Lombes, and Mirande. Total public revenue (1831), £877,807 fr. t. surplus over expenditures, £217,807 fr. But, notwithstanding this apparent prosperity, the number of large properties is much below the average of the dep., and the people are generally impoverished. "*La vie des femmes n'est pas moins laborieuse que celle des hommes. Les femmes mariées ont soin du ménage, de la volaille, &c. Les jeunes filles, tant qu'elles sont enfans, gardent les bestiaux et les troupeaux. Dès qu'elles grandissent, elles partagent tous les travaux de l'agriculture, et toutes les fatigues des hommes.*" (Hugo, art. Gerv., &c.)

GHAZIPOOR, or GHAZEPORE, a distr. of British Hindostan, presid. Bengal, prov. Allahabad; between lat. 25° 10' and 26° 30' N., and long. 82° 40' and 84° 30' E.; having N.W. and N. the distr. Astringhur and Gorumkora, N.E. Barun, S.E. Shahabad, and W. Benares and Jaunpore. Area, 2,850 sq. m. Pop. and land revenue not specified in the Parl. Report. The Ganges runs through its S. part; the Goggra bounds it on the N. It is one of the most fertile divisions of Hindostan, and the sugar-cane, corn, and fruit trees &c., it contains cultivated. It has long been celebrated for the excellence of its rose-water and attar. "The roses of Ghazepore are planted, in large fields, occupying many hundred acres of the adjacent country. They bloom sparingly, upon a low shrub, which is kept to a dwarfish size by the gardener's knife, and the full-blown flowers are carefully gathered every morning. The first process which the roses undergo is that of distillation. They are put into the alembic with nearly double their weight of water. The rose-water thus obtained is poured into large shallow vessels, which are exposed, uncovered, to the open air during the night. The jars are skimmed occasionally; the essential oil floating on the surface being the attar. It takes 300,000 flowers to produce the weight of a rupee in attar. This small quantity, when pure and unadulterated with sandal oil, sells upon the spot at 100 rupees (10*l.*); an enormous price, which, it is said, does not yield very large profits. A civilian, having made the experiment, found that the rent of land producing the above-named quantity of attar, and the purchase of attar, came to 6*l.*; to this sum the hire of labourers remained still to be added, to say nothing of the risk of an unproductive season. The oil produced by the above-mentioned process is not always of the same colour, being sometimes green, sometimes bright amber, and frequently of a reddish hue. When skimmed, the produce is carefully bottled, each vessel being hermetically sealed with wax; and the bottles are then exposed to the strongest heat of the sun during several days. Rose-water, also, when bottled, is exposed to the sun for a fortnight at least." (Robert's *Scenes, &c. of Hindostan*, ii. 118-115.) Rose-water which has been skimmed is reckoned inferior to that which retains its essential oil, and is sold at Ghazepore at a lower price; though, according to many, there is scarcely, if any, perceptible difference in the quality. A seer (a full quart) of the best may be obtained for 8 annas, or about 1*s.* It enters into almost every part of the domestic economy of the natives of India, being used for ablutions, in medicine and cookery, as presents, &c. The chief towns in this district are Ghazipoor, the cap., Asimpore, and Doorgahat. (Hamilton's *E. I. Gaz.*; Robert's *Hindostan*; Parl. Rep. on *E. I. Affairs*, &c.)

GHAZIPOOR, a large town or city of Hindostan, prov. Allahabad, cap. of the above distr., on the N. bank of the Ganges, 40 m. E.N.E. Benares, and 100 m. W. Patna; lat. 26° 35' N., long. 83° 33' E. From the river it has a very striking appearance, though, like other Indian cities, its noblest buildings turn out, on approach, to be ruins. "The native city is better built and better kept than many places of more importance. The bazars are neat, well supplied, and famous for their tallars, whose excellent workmanship is celebrated in the adjacent districts. A very considerable number of the inhab. are Mussulmans, though the neighbouring pop. is chiefly Hindoo; their mosques are numerous and handsome, and the former grandeur of Ghazipoor is evinced by a superb palace, built by the Nawab Cosim Ali Khan, which occupies a considerable extent of ground overlooking the Ganges. This noble building is now in a melancholy state of dilapidation, neglected by the government, who have turned it into a gatum-house, and have converted many of its suites of apartments into warehouses, and the residences of police peons belonging to the guard. Though thus rendered useful, it is not thought worthy of repair; its splendid banquetting-hall and cool verandah, so replete with architectural beauty, abutting into the river, are deserted, and left to the swift devastations of the climate. In a very short period the whole of this magnificent fabric will become a heap of ruins." (Ro-

bert's *Scenes, &c.* ii. 124.) At the other extremity of the town are the houses of the civil servants of the company. These are spacious and well-built, and surrounded by gardens. The military cantonments adjacent are, however, low, ugly bungalows, with sloping roofs of red tile, but deriving some advantage from being interspersed with trees. "A very different from the stately but squalid barracks of Dinapore." On the parade ground, a little N.E. the city, is the mausoleum of the Marquis Cornwallis, who died at Ghazipoor. This edifice consists of a dome supported upon pillars, and is entirely constructed of large blocks of Chunar freestone. It cost a lack of rupees, and 18 years were spent upon its erection; but its style and execution have been found much fault with; and it is insignificant when compared with the native sepulchral edifices of Hindostan. The goal of Ghazipoor is large, strong, airy, and commodious, and usually crowded with delinquents of all castes and denominations; this district being noted for the turbulence of its inhab., and their insubordination to the laws. The E. I. Company have a breeding stud of horses near the city. Ghazipoor is garrisoned by two or three companies of a native regiment; it is famous for its salubrity; and is well supplied with European and native products. Its environs are planted with fine forest trees, the haunts of innumerable monkeys and birds. (Robert's *Scenes, &c. of Hindostan*, vol. ii.; Heber's *Hamilton's E. I. Gaz.*, &c.) GHEENT (Ger. *Ghent*), a city of Flanders, cap. of Belgium, cap. of Flanders, at the confluence of the Scheidt and Lys, 30 m. N.W. Brussels, 30 m. W.S.W. Antwerp, and 23 m. S.E. by E. Bruges; lat. 51° 3' 19' N., long. 2° 43' 49' E. It is the seat of a bishopric, of a court of appeal, a tribunal of first resort, and a chamber of commerce; is a fortress of the second class, and the residence of a high military commandant for the provs. of E. and W. Flanders. The pop., which in the 16th century is reported to have amounted to 175,000, had, in 1838, sunk to 88,250 (*Herschling*); but, notwithstanding this decline in the number of its inhab., it is not characterized by the decayed and listless appearance of its neighbour Bruges. Under Charles V. this city probably covered more ground than any other in W. Europe, whence the boast of the emperor, "that he could put Paris in his glove" (*Gant*). At present the circ. of its walls is between 7 and 8 m.; but much of the enclosed space is occupied by fields, gardens, and orchards. The shape of the city is somewhat triangular; it is entered by 7 gates. The Scheidt and Lys, together with the Lieve and Moore, after having supplied the ditcher surrounding the fortified city, enter the city, and in conjunction with some artificial canals, divide it into 26 islands, most of which are bordered by magnificent quays. Of the bridges connecting these islands, 70 are of considerable size; and of these, 42 are of stone and 28 of wood. In general, the streets are wide, though a few of the most frequented are so narrow that two carriages cannot pass each other. There are numerous fine public edifices; and many of the private houses are well built and handsome. Their antique appearance, and the fantastic variety of the stair-heads, gables, and ornaments with scrolls and carvings, arrest the stranger's eye at every turn. There are 13 public squares. The principal is the *Marché au Vendredi*, or Friday Market, so called from its weekly linen market held on that day. In its centre was formerly a column, erected in 1600, in honour of the emperor Charles V. The greatest curiosity in the Friday Market is an enormous iron ring, upon which are exposed the pieces of linen, which, having been found defective on being brought to market, are confiscated by the authorities, and given to the hospital. The square of St. Peter is one of the largest in Belgium; it serves as a parade ground for the garrison. In the Place St. Phalaride is an old towered gateway, a relic of the castle of the counts of Flanders, built in 888, and doubtless one of the oldest existing remains in Belgium. This castle was, in 1388-39, the residence of the family of Edward III., whose son, John of Gaunt or Ghent, Duke of Lancaster, was born in it. Its existing remains form part of a cotton factory. The corn market and the *Place de Récollets* are the other chief squares.

The finest promenades in Ghent are, one along the *Couperie*, a canal cut in 1756, uniting the Lys with the Bruges canal; and the *Kouter*, or *Place d'Armes*. The boulevards, anciently the ramparts surrounding the city, and some of the quays, are also agreeable promenades. Ghent contains many churches worthy of notice, not only for their architecture, but for the *degl-d'eglises* of the Flemish school which they contain. The cathedral, or church of St. Bavo, near the centre of the city, was originally founded in 941, and the crypt, or *crypte*, or *terrace* of the original building, still exists. The modern edifice was commenced in 1330, and completed early in the 16th century. Its style is simple Gothic; it has no very striking beauty externally, if we except its tower, remarkable for its elegance and height, about 200*ft.* From its summit, which is ascended by 448 steps, the surrounding country may be seen in clear weather for a distance little

short of 40 m. The interior of this church is of almost unrivalled magnificence. It is entirely lined with black marble, with which the pillars of pure white Italian marble form a strong contrast. Adjoining the cathedral is the *Beffroi*, or belfry, a lofty square tower, founded in 1182. Its lower part is used for a prison; its summit is ornamented with a gilt copper dragon, carried off by the *Gentils* from Bruges in 1445, to which city it had been taken from Constantinople during the first crusade. The church of St. Michael, containing the celebrated "Crucifixion" by Vandeyck (now much injured), the "Annunciation" by Lens, and the finest organ in Belgium; that of St. Nicholas, the oldest church in Ghent; and those of St. Peter, St. Martin, St. James, St. Sauveur, the Dominicans, and the Augustines, all contain excellent paintings, and are well worth notice. There are in all 65 churches, including an English Protestant church and a synagogue. Ghent contains the only large nunnery that survived the dissolution of conventual institutions by the Emp. Joseph II. This establishment, called the Grand Béguinage, founded in 1234, is of great extent, forming almost a little town of itself, with streets, squares, and gates, surrounded by a wall and moat. It is inhabited by about 600 nuns. The Béguines are not bound by any vow; they may return into the world whenever they please; but it is said to be their boast that no sister has been known to quit the order after having once entered it. The sisters attend the sick as nurses in the hospitals and elsewhere.

The finest public building in Ghent is the palace of the university, founded by William I., king of Holland, in 1816, and attended by about 350 students. In front it has a fine portico raised upon eight Corinthian columns. It has a noble entrance-hall under a vaulted roof 91 ft. in height, a grand staircase, an amphitheatre capable of accommodating 1,700 persons, in which academic prizes are distributed; a court of classes, or square, surrounded by lecture rooms; and cabinets of natural history, comparative anatomy, mineralogy, and natural philosophy. The library, containing 60,000 vols. besides many valuable MSS., the royal college, and the botanic garden, occupy the ancient abbey of Bantloo and its grounds. Besides these institutions, Ghent has a museum and royal academy of drawing, the expense of which are defrayed by voluntary contributions; societies of rhetoric, the fine arts and literature, music, botany and horticulture, agriculture and commerce, and various clubs for gymnastic and other pursuits. The museum contains a good many paintings, though none are of first-rate excellence; but there are several private collections of great merit, the principal being that of M. Van Schamp, containing a fine "Annunciation," by Correggio; several paintings by Rubens, including portraits of himself and family; and others by Rembrandt, Vandeyck, Teniers, and other distinguished masters.

The town-hall is a large and, at first sight, an imposing building. It has a double front; one in the Moorish-Gothic, and the other in the classic style. The architecture of the latter is incongruous; it is a principal source being ornamented successively with Doric, Ionic, and Corinthian columns. This front has upwards of 70 windows, exclusive of those in the roof. In the interior is the throne-room, in which the treaty called the Pacification of Ghent was signed in 1576. This large and fine apartment is now used for the distribution of prizes given by the town to those who attain excellence in the arts, &c. There are 23 public hospitals. The principal, the *Dyke* (enclosure), founded 1226, is capable of containing 600 sick persons, and has attached to it a asylum for aged individuals of both sexes. There are some hospitals for aliens, 3 lunatic asylums, 3 deaf and dumb institutions, and many other charities. The great prison, remarkable for its size and admirable arrangement, has served as a model for several others in London, Prussia, and the U. States. It was begun under Maria Theresa in 1774, and finished in 1834; it stands on the *Couperie*. "Its form is that of a perfect octagon, in the middle of which is a large court-yard, communicating with the different parts of the prison. Each division has a yard, and in the centre of that appropriated to the women is a basin for washing linen. Each prisoner sleeps alone in a small room, looking into an extensive and well-lighted gallery. These apartments are kept very neatly, and are ventilated when the prisoners go to work. The annual expense of this establishment is about 50,000 florins, and the number of prisoners is 1,500; 1,100 of whom are occupied in manufacture and household work. One half of the produce of the prisoners' labour is reserved by the government for the expenses of the establishment, &c., and the remainder is divided into 3 portions, one of which is given to the prisoners for pocket-money, while the other two accumulations are given to them on leaving the prison." (*Anger's Belg. Traveller*.) The ruins of the Citadel, constructed by Charles V., are still to be seen near the Antwerp gate. The modern citadel, built between 1833 and 1830, the cavalry barracks, *Hôtel de l'Arme*, workhouse, *mout-de-pain*, fish-market, slaughter-

house and shambles, theatre, and the celebrated piece of cannon—the largest in Europe—18 ft. long, 104 in circumference, its bore 24 in. in diameter, and weighing 34,000 lbs., are the remaining objects most worthy of remark in Ghent. The climate of the city is healthy and temperate; the average heat of winter is 21°, of summer about 70° Fahr.

Manufactures and Commerce.—At the commencement of the 18th century, Ghent is said to have contained 40,000 weavers; but this, like most statements of the sort, is most probably much exaggerated. At the commencement of the present century, the manufacture of cotton yarn was introduced; and furnished employment, we are told, in a few years, to more than 80,000 workmen! In 1804, while united to France, Ghent was ranked by Napoleon as the chief manufacturing town in his dominions after Lyons and Rouen. In 1819, the importation of spinning-jennies and high-pressure steam-engines from England afforded an additional stimulus to the cotton manufacture. The separation of Holland from Belgium in 1830 gave a considerable shock to industry and trade; and several capitalists soon after removed their establishments into Holland. According to Vandermaelen, in 1834, there were in Ghent from 200 to 250 mills of different kinds wrought by steam; about 19,000 workmen were employed in bleaching, cotton printing, and cotton-thread factories, within a diameter of 3 leagues round the city; and the capital employed in the cotton manufactures (ex. thy. raw material) was estimated at about 21,000,000 florins. The manufacture has recently, however, been involved in the greatest difficulties; and it is doubtful whether it is ever destined to take firm root in the city, or to be able to withstand the competition of foreigners under a system of free competition. Previously to the French Revolution, lace was the staple manufacture of Ghent, great quantities of it being sent to Holland, England, France, Spain, and the colonies. Lace-making has now greatly diminished; but it still ranks, together with the manufacture of silk, linen, and woollen fabrics, amongst the principal branches of industry, after that of cotton. The sugar-refineries employ annually from 10,000,000 to 12,000,000 lbs. of the raw material. There are numerous gin-distilleries, soap-manufactories, breweries, tanneries, and salt-works. Sail-cloth, oil-cloth, gold and silver stuffs, masks, gloves, pins, bronze articles, mineral acids, white lead, Prussian blue and other colours, buttons, cards, paper, tobacco and tobacco-pipes, glue, surgical instruments, machinery, cutlery, articles of various kinds, in wood, stone, ivory, &c., are made in Ghent, and there are some good building docks. The city is admirably situated for commerce. It is connected by one ship-canal with Bruges; and by another, which passes by Sas Van Ghent, with the Scheldt at Terneuse. The latter gives the city all the advantages of a sea-port; vessels drawing 18 ft. water may unload in the basin under its walls. The country in the vicinity produces a great deal of corn, flax, tobacco, and madder; and besides its manufactured produce, Ghent has a large trade in these articles, especially the first, and a very extensive transit trade.

The origin of Ghent is involved in uncertainty; but it is tolerably well ascertained that it became a place of considerable importance early in our era. In 879-80, the Dames under Hastings, repulsed from England, plundered Ghent, and obtained an immense booty. Ghent belonged successively to the counts of Flanders, and the dukes of Burgundy; but the allegiance of its citizens appears to have been little more than nominal, since, whenever the seigniors attempted to impose an unpopular tax, the great bell sounded the alarm, and the citizens flew to arms, and killed or expelled the officers of the sovereign. The city became subsequently the cap. of Austrian Flanders; but having, in 1539, unwarily rebelled against the authority of its sovereign, the emperor Charles V., and even offered to transfer its allegiance to his rival, Francis I., king of France, it brought on itself a punishment, from the effects of which it never fully recovered. In 1578, it was taken by Louis XIV.; in 1706, by Marlborough. In 1793, it was again taken by the French, and was, till 1814, the cap. of the *Dep.* of the Scheldt. Ghent has given birth to many distinguished individuals, at the head of whom must be placed the emperor Charles V., born here on the 24th of February, 1500; among the others may be mentioned John of Gaunt, son of Edward III.; the popular leader, Jacques Van Artevelde, the "brewer of Ghent," and his son Philip; Heiniaus the critic; the sculptor Delvaux, &c. (*Vandermaelen, Dict. of E. Flanders; Gautier, Pays Bas*, pp. 320-330, &c.; *Murray, Belg.*, &c.)

GHILAN. Prov. of Persia, in N.W. part; between lat. 36° 25' and 37° 45' N. and long. 46° 25' and 50° 47' E.; having N.W. the Russian distr. of Talish, S.W. the Elbourz mountains, separating it from Azerbaijan and Irak, S.E. Masanderan, and N.E. the Caspian. Length, N.W. to S.E., about 130 m.; area, probably about 5,000 sq. m. Pop. uncertain. It is one of the

most beautiful portions of the Persian empire. Climate mild and healthy, except in certain districts in summer. It is well watered, and abounds with forests of oak, pine, box-wood, &c.; along the Caspian, there are extensive morasses. The soil is very rich, and yields hemp, hops, many kinds of fruit, corn, rice, &c. in great quantities. The vine grows with the greatest luxuriance; but the chief product of the prov. is silk of excellent quality, the culture and manufacture of which employs most of the pop. The only town of any consequence is Reshd, on the Caspian, which has a considerable trade in silk, &c. with Astrakhan. (*Kinneir, Pers. Emp. &c.*)

GHIZNI, or GHUZNEE, a fortified town or city of Afghanistan, and formerly the cap. of an empire reaching from the Tigris to the Ganges, and from the Jaxartes to the Persian Gulf: though now containing only about 1,500 houses, exclusive of suburbs without the walls, it is still considered throughout central Asia as a fortress of the highest importance. It stands on a slight elevation, in a plain nearly 7,000 ft. above the level of the sea, at the foot of a narrow range of hills, 84 m. S.W. by S. Caubul, and 156 m. N.E. Candahar. From its great height its climate is very cold; for a great part of the year the inhab. seldom quit their houses, and the snow has been known to lie deep on the ground long after the vernal equinox. It is surrounded by stone walls, sanked with numerous towers, and entered by 3 gates, outside which is encompassed by a *fosse*, *braye*, and wet ditch. On the W. side the walls are elevated to a height of 380 ft. above the level of the plain; and the rock on which they are built might be scarp'd so as to render it thoroughly inaccessible on that side. (*Vigne*) The Ghizni river, a pretty large stream, runs along its W. face; and previously to its capture by the British, a new outwork had been constructed commanding its bed. Ghizni has 3 bazars, of no great breadth, with high houses on each side; a covered *chaussee*, and several dark and narrow streets. A citadel, enclosing a palace, is the only edifice worth notice. About $\frac{1}{2}$ m. N. of the city stands a minaret, and about 400 yards farther, another of the same kind, erected by Sultan Mahmoud of Ghizni. Both are of brickwork, elegantly ornamented, and covered in many parts with Cufic inscriptions. Adjoining them is the site of Old Ghizni, a city which, in the 10th century, was, according to Ferishta, adorned beyond any other in the E. The adjacent plain is covered with ruins. About 3 m. from the modern town, in the midst of a village, is the tomb of Mahmoud, a spacious but not a magnificent building, covered with cupola. But of all the antiquities of Ghizni, the most useful is an embankment across a stream which was built by Mahmoud, and which, though damaged by the insane fury of the Ghoree kings, still supplies water to the fields and gardens round the town. (*Elphinstone, Caubul*, l. 141, 142.)

The empire of which Ghizni was the cap., was founded by Sebuctagh in 975, and lasted under 13 successive sovereigns till 1171, when the city was conquered by Mahmood Ghoree, and burned. Recently it has acquired some celebrity from having been taken by storm by the British, 23d July, 1839, after a siege of less than 48 hours; the town being garrisoned by about 3,500 Afghans, under the command of a son of Dost Mahomed Khan. Our loss on that occasion amounted to 17 men killed, and 182 wounded. Of the enemy, about 600 were killed, many wounded, and 1,600 taken prisoners, including the governor and his staff. (*Elphinstone, Caubul; Vigne; Osburn; Campaign in Afghanistan, &c.*)

GIANT'S CAUSEWAY, a basaltic promontory of Ireland, N. coast of Antrim, betw. Buncrana Bay and Head on the E., and the embouchure of the Bush river on the W. This extraordinary promontory consists of a vast mole or quay, formed of polygonal basaltic columns, projecting from the base of a steep promontory to a great distance into the sea. It is divided into three distinct portions: the first, which is seen at low water, is about 1,000 ft. in length, and the others not quite so much. The pillars are from 40 to 55 ft. in length, and have from 3 to 8 sides; but those having 6 sides are by far the most common. The surface formed by the summits of the pillars is so smooth, and the joints so close, that the blade of a knife can hardly be introduced into them. The pillars are divided into segments, admirably fitted to each other, varying from 6 in. to a foot in thickness. At Fair Head and Bencora Head, in the immediate vicinity, the columns are higher; but the angles are not so sharp, and they are altogether of a coarser texture than those of the Giant's Causeway. The same sort of basaltic columns, though of a less perfect form, extend along the coast for several miles, and being sometimes detached from the shore, have, at a distance, the most grotesque appearance. Raheen Island contains similar columns; and they extend a good way inland.

GLIAVENO, a town of N. Italy, k. Sardinia, prov. Suse, cap. mand., on the Sangone, 16 m. W. by S. Turin.

Pop., in 1838 (inc. commune), 8,968. It is encircled by an old wall, and has manufactures of silk and linen, with tanneries and iron forges, some transit trade, and a market for linens, &c. which is well attended.

GIBRALTAR, a town and very strong fortress belonging to Great Britain, in the S. part of Spain, adjoining the narrowest part of the strait joining the Atlantic and Mediterranean, to which it gives name; 61 m. S.E. Cadix, 93 m. S. by E. Seville, and 319 m. S.S.W. Madrid; lat. 36° 6' 30" N., long. 5° 31' 12" W. Pop. about 20,000, exclusive of about 3,000 troops. The fortress stands on the W. side of a mountainous promontory or rock (*the Moors Calpe* of the ancients), projecting into the sea S. about 3 m., being from $\frac{1}{2}$ to $\frac{3}{4}$ m. in breadth. The S. extremity of the rock, 11 $\frac{1}{2}$ m. N. Ceuta, in Africa, is called Europa Point. Its N. side, fronting the low narrow isthmus which connects it with the mainland, is perpendicular, and wholly inaccessible; the E. and S. sides are steep and rugged, and extremely difficult of access, so as to render any attack upon them, even if they were not fortified, next to impossible; so that it is only on the W. side, fronting the bay, where the rock declines to the sea, and the town is built, that it can be attacked with the faintest prospect of success. Here, however, the strength of the fortifications is such that the fortress seems impregnable, even though attacked by an enemy having the command of the sea. The town, which lies on a bed of red sand, at the foot of the rock, on its N.W. side, has a principal street, nearly a mile long, well built, paved and lighted; and of late years many of the narrow streets have been widened, the alleys removed, and the general ventilation improved. Still, however, "the houses are constructed for the latitude of England, not of Africa; for, instead of patios, fountains, and open galleries, admitting a free circulation of air, closed doors, narrow passages, wooden floors, small rooms, and air-excluding windows, keep out the fresh, and keep in the foul air." (*Ingis*, v. 121.) These circumstances seem, in part at least, to account for the contagious fevers by which the town is sometimes scourged. The principal buildings are the governor's house and garden, the admiralty, the naval hospital, the victualling-office, and the barracks. There is an excellent public library, founded in 1798, and a small theatre. A steam corn-mill has lately been erected. The Protestant church, situated on the Line-wall, will contain 1,048 persons, and the governor's chapel at the convent, 300 more; the Rom. Cath. church, when full, contains about 1,500. The Wesleyan Methodists have a place of worship, and there is a Jews' synagogue. In 1836, there were three schools in Gibraltar, two on Bell's system, educating together 619 boys and girls, and one on the Lancasterian plan, educating 300 boys; the last is wholly supported by the Rom. Caths. The fortifications are of extraordinary extent and strength. The principal batteries are all casemated, and traverses are constructed to prevent the mischief that might ensue from the explosion of shells. Vast galleries have been excavated in the solid rock, and mounted with heavy cannon; and communications have been established between the different batteries by passages cut in the rock, to protect the troops from the enemy's fire. In fact the whole rock is lined with the most formidable batteries from the waters to the summit, and from the Land-gate to Europa Point; so that, if properly victualled and garrisoned, Gibraltar may be said to be impregnable.

The bay of Gibraltar, formed by the headland of Cabrita and Europa Point, 4 m. distant from each other, is spacious and well adapted for shipping, being protected from all the more dangerous winds: the extreme depth within the bay is 110 fathoms. To increase the security of the harbour, two mole-heads have been constructed, which respectively extend 1,100 and 700 ft. into the bay. The Spanish town and port of Algeciras lie on the W. side of the bay. As a commercial station, Gibraltar is of considerable consequence. Being made a free port in 1704, subject to no duties and restrictions, it is a convenient entrepôt for the English and other foreign goods destined to supply the neighbouring provinces of Spain and Africa. Gibraltar, however, is fallen and falling as a place of commerce; and there is no prospect of its revival. This decay is owing to a variety of causes, partly and principally, perhaps, to the insecurity and apprehension occasioned by the fear of pestilential disorders, which raged dreadfully in 1804 and 1838; partly to the circumstance of goods being now largely stored at Malta and Genoa, that were formerly deposited here; partly to the orders of the Spanish government almost preventing the introduction of British produce; and, more recently, to the making of Omda a free port, a measure, however, which has since been revoked. In 1838, the declared value of British and Irish produce and manufactures exported from England to Gibraltar amounted to 894,096*l.* The cost of this colony to Great Britain amounted, in 1834, to 173,440*l.* But the advantage which the possession of Gibraltar confers on Great Britain, though wholly of a political character, is most important. It is, as it were, the key of the Mediter-

anean; and while its occupation gives us the means of effectually annoying our enemies in war, it affords equal facilities for the protection of our commerce and shipping.

Gibraltar, the *Cape of the Greeks*, formed with Aylea on the African coast "the pillars of Hercules." Its name was changed to *Giblet-Tarif* or mountain of Tarif, in the beginning of the 8th century, when Tarif Ebn Zarcia landed with a large army to conquer Spain, and erected a strong fortress on the mountain side. During the Moorish occupation of Spain it increased in importance, but was at length taken by Ferdinand, king of Castile, in the 14th century. It was soon recaptured, and did not become the appanage of Spain till 1462. It farther his- tory till its conquest by the English in 1704, is unimpor- tant. During the war of the Spanish succession, the English and Dutch fleets, under Sir George Rooke and the Prince of Hesse-Darmstadt, attacked the fortress, which surrendered after some hours' resistance. The Spaniards, during the nine following years, vainly tried to recover it; and in 1713 its possession was secured to the English by the peace of Utrecht. In 1727 the Spaniards blockaded it, for several months, without success. The most memorable, however, of the sieges of Gibralt- ar is the last, begun in 1781 and terminated in 1782. The batteries on the rock were known to be most for- midable; and yet the bold, not to say extravagant, project was entertained of attempting to silence them by the fire of ten enormous floating batteries ingeniously constructed by the Chevalier d'Arçon. A powerful com- bined French and Spanish fleet and army was collected to co-operate in the attack, which excited an extraordinary interest in all parts of Europe. The grand effort was made on the 13th of Sept., 1782; and the only thing to be wondered at is, that the floating batteries should have so long resisted, as they actually did, the tremendous fire of red-hot shot to which they were exposed. At length, however, two of them took fire, and their terrific explosion terminated the conflict. The garrison, and their gallant commander, Sir Gilbert Elliot, afterwards Lord Heathfield, were not more distinguished by their brave defence than by their generous efforts to rescue their enemies from the flames and the waves. No farther attempt has been, nor is it likely will be, made to deprive us of this fortress.

GIEN, a town of France, dép. Loiret, cap. arrond.; on the Loire, and on the high road between Orleans and Nevers, 37 m. S.E. of the former. Pop. (1826) 780. It is irregularly built on a hill, on the summit of which is its church, and an ancient castle now serving for the sub-prefecture, the residence of the mayor, and the seat of a tribunal of original jurisdiction. The Loire is here crossed by a handsome stone bridge, and the town has a spacious quay, and a good bath establishment. Here also are manufactures of earthenware, serge, leather, &c. It has some trade in agricultural produce. (*Hugo, &c.*)

GIESSEN, a town of W. Germany, Hesse-Darmstadt, cap. prov. Upper Hesse; on the Lahn, which is here crossed by a stone bridge, 47 m. N. by E. Darmstadt, and 49 m. E.N.E. Coblenz. Pop. 7,300. It was formerly fortified; but its ramparts have been levelled, and their site is now laid out in public walks. It is irregularly built; but has some good edifices, including the castle, now the seat of the provincial government, the uni- versity, *pedagogium*, arsenal, town-hall, and a new church. Giessen is chiefly noted for its educational establishments, which constitute one of its principal re- sources. Its university, founded in 1527, is now usually attended by between 500 and 400 students; a few years ago, the ordinary number was upwards of 500. The town has, besides, a teachers' seminary, several other seminaries of a superior kind, schools of forest economy and midwifery; a lying-in hospital, philological institute, 3 public libraries, a cabinet of natural history, and a botanic garden. It is the residence of the governor of Upper Hesse, the seat of a superiordjudicial court for the prov.; a council of mines, board of taxation and com- mittee of public instruction. It has a few manufactures of tobacco and woollen goods. (*Zeyher; Cosmopol.*)

GILOLO, one of the Molucca Islands, which see.

GIOVENAZZO (an. *Nativum*), a sea-port town of S. Italy, k. Naples, prov. Bari, cap. cant., on a high rock which advances sufficiently into the Adriatic to afford shelter on its N. side to a considerable number of fish- ing boats, 24 m. N.W. Bari, and 44 m. S.E. Molfetta. Pop. 5,600. It is surrounded by strong turreted walls, and further defended by a castle. It is, however, a miserable-looking place, though it contains some good houses. Its streets are narrow, dark, and dirty, and crossed by frequent deep archways, which render them still more gloomy. Giovenazzo is the seat of an arch- bishopric, united to that of Terlizzi; it has a cathedral, 3 other churches, several convents, 3 hospitals, and an asylum for foundlings, mendicants, &c. Without the town, an avenue of immense cypress and pine trees, nearly a mile in length, leads to a very large, but dis- tinguished palace, formerly belonging to the Cellamare family. (*Vesuvius's Tower, &c.* pp. 55, 56, &c.)

GIRGENTI, a town of Sicily adjacent to the ruins of the ancient *Agrippæna*, or Agrigentum, cap. intend., in the Val di Mazzara, 56 m. S.S.E. Palermo, and 96 m. W. by N. Syracuse; lat. 37° 19' 26" N., long. 13° 37' E. Pop. (1831) 17,767. The modern city stands on the slope of one of the highest hills of S. Sicily, called *Monte Ca- nisco*, about 1,300 ft. above the sea, and nearly 4 m. from the port, at the mouth of the small river which divides the present city from the ruins. The mode of building Girgenti, with its streets rising in terraces, and the cathedral crowning the whole, gives it an imposing aspect from the sea; but the interior is irregular and dirty; most of the streets, or rather alleys, are ill paved, and not only difficult of access, but many of them are absolutely dangerous, and the whole aspect of the place is rendered still more comfortless by a prevalent appear- ance of poverty." (*Smyth's Sicily*, p. 205.) Besides the cathedral, there are 45 churches and 16 convents, a fact which fully explains the extraordinary number of ecclesiastics met with here, and the consequent poverty of the people. The cathedral, a large, heavy building of the 18th century, is in the Norman style, barbarously mixed with a modern imitation of the Greek orders; the chief curiosity is an echo, or *sonus ecor*, by which a whisper is conducted from the entrance to the cornice over the high altar (280 ft.). It has a beautiful font of carved stone, and some pictures, one of which is a Madonna by Guido. Bishop Lucchesi, a great benefactor to Girgenti, among other acts of enlightened policy, founded a se- minary for the clergy, and a good public library, to which he bequeathed a valuable collection of antique vases, coins, and medals. The country round is delightful, producing corn, wine, and oil in great abundance, with a great variety of fruits, as, oranges, lemons, pomegran- ates, almonds, &c. The port of Girgenti has a mole built by Charles III. in 1756; a lighthouse was here erected on the mole-head, and another on an adjacent cliff, but they are so badly constructed and lighted, as to be nearly useless. There are here very extensive *carri- catori*, or magazines, dug in the rock, for the warehous- ing of corn, considerable quantities of which are shipped from this port, and which, under an intelligent govern- ment, capable of calling forth the productive energies of the country, might be vastly increased: It is, also, a principal port for the shipment of sulphur. In ordinary years, about 70 British ships clear out from Girgenti, mostly loaded with brimstone.

The ancient Agrigentum was not only one of the largest and most famous cities of Sicily, but of the ancient world. According to Polybius, it surpassed most other cities in its advantageous situation, its strength, and the beauty and grandeur of its buildings. Its ruins, so inter- esting to the historical student for the reminiscences they suggest, and to the antiquary and artist for their instructive lessons on ancient architecture, stand be- tween the *Zeus Atheneæ*, a high rock E. of Girgenti, and the two branches of the river anciently called *Agras*, in the midst of orchards, gardens, and groves of the most luxurious foliage. The S. wall stood on a rock, having adjoining to it a triangular plain, in which may still be seen the tomb of Theron, one of the most il- lustrious of all the princes, or *tyrannæ*, who ruled over Agrigentum. (See *Diod. Sic. lib. xl.*) It is about 28 ft. high, and 15 ft. square at the base, consisting of a square pilaster on a triple plinth, with a cornice, and fluted Ionic columns in the attic story; but Mr. Smyth describes it as "neither magnificent nor elegant, a strange mixture of architectural peculiarities." At the E. angle of the S. wall, on a bold rock, stands the temple of Juno, or rather the Doric columns that formed a part of it. Their situation on a gently swelling eminence, and sur- rounded by fruit trees, is highly picturesque. On the W. front a grand flight of steps leads up to the vestibule, which was supported by 6 fluted Doric columns; at the sides are 13 others not fluted. Within this temple were preserved some of the most valuable pictures of antiquity, among which was one by Zeuxis of the goddess herself. W. of these ruins is the temple of Concord, which pre- sents the most perfect specimen extant of the earliest epoch of Greek architecture. It is composed of a paral- lelogram, like the last, 6 columns broad in front, and 18 columns at the sides. It is *peripteral*, that is, has a colonnade all round the building. In each of the side walls of the cella are 6 arched openings without any appear- ance of doors, and on each side of the transverse wall of the pronaos a flight of steps leads to the summit of the architrave; the whole temple, with the exception of part of the entablature and roof, is so nearly perfect, as to be a favourable specimen of the beauty of uninterrupted lines in architecture. Its dimensions are—

	Feet.	Inches.
Length	121	6
Breadth	54	6
Length of collier	48	6
Width of ditto	23	1
Height of columns	49	1
Diameter of ditto at base	4	7

The last king of Naples repaired the most damaged parts of this structure, and it is now used as a Christian church. His name and work recorded on the front entablature in large bronze characters, on a glaring white ground, ill agree with the softness and chastity of the old building. W. of the temple of Concord, and near the sea-gate, stood the temple of Hercules; but the foundations and one single dilapidated column are all that remain. Cicero (in his fourth Oration against Verres) speaks in rapturous terms of a statue of the god, the face of which had been worn by the kissing of devotees. Nearly opposite the ruins of the last temple, are the gigantic remains of the temple of the Olympian Jupiter, now known as *il Tempio di Giganti*, which, although never completed, was the largest religious edifice of Sicily. Diodorus says that it was 360 ft. long, 60 ft. broad, and 120 ft. high to the commencement of the roof; but it appears probable, from a comparison with other temples and their proportions, that 160 was meant, instead of 60, for the breadth, an error that might easily have crept into the early manuscripts (*Smyth*, p. 211.); and an examination of the ruin justifies the supposition. Enormous blocks of stone testify its former grandeur. One of the columns measured by Russell in the upper part of its length had flutings, the girth of which was 23 in., a circumstance which goes far to confirm the statement of Diodorus, "that a man might easily place himself in one of them." The lower half of a human face, apparently part of a statue that ornamented the pediment, measured a foot from the chin to the middle of the mouth, and 2 ft. across from cheek to cheek, dimensions much larger than those of the Egyptian Memnon in the British Museum. (*Smyth*, p. 212.) The Sicilian government, about the commencement of the last century, when the mole of the harbour was built, gave orders that the stones of this noble ruin should be removed and used in its construction; and this circumstance, to a greater extent than any other, accounts for the paucity of the present remains. The dimensions of the temple, as computed by Mr. Cockerill, who devoted great labour to ascertain the facts, are as follows:—

Length of basement	-	-	-	Feet.	Inches.
Breadth	-	-	-	152	2
Ditto of cell	-	-	-	64	6
Ditto of temple interior	-	-	-	142	6
<hr/>					
Height of basement	-	-	-	9	6
Ditto of columns	-	-	-	61	6
Entablature	-	-	-	25	6
Temple	-	-	-	25	6
Total height	-	-	-	120	ft.

Near these ruins are those of the temple of Vulcan, and that of Castor and Pollux; the latter is singular, as being the only one of the Ionic order. The celebrated spring of Petroleum, and the fish-pond excavated by the Carthaginian prisoners, after the disasters of Himera, a.c. 480, still exist: this pond was more than 40 ft. deep, (Diodorus says 120.) and about 4,600 ft. in circumference, and is stated to have amply supplied the tables of the rich and luxurious Agrigentines, of whom Plato wittily said, "they built as if they were going to live for ever, and ate as if directly about to die." *Age of Agrigentines elucidated by the old Sicilian ruins, described by the late Sir John Lubbock, Bart.* (Edin., lib. xli. 29.) The pond is now dry, and used as a garden, as it was also in the time of Diodorus, who, therefore, must greatly have mistaken its dimensions. Besides the ruins thus described in detail, there are fragments dispersed over the entire site of the city, respecting which conjecture has been busy, but which need no particular mention. It is curious, however, that in the whole space within the city walls there are no ruins that can be presumed to have belonged to places of public entertainment. (*Swinhurne*, li. 291.) On the whole, Agrigentum may be truly said to be surpassed by few cities, either in respect to the beautiful and magnificent Grecian temples and other antique monuments still existing, or the wild and romantic scenery with which it is surrounded. (*Russell*, p. 100.)

Vast as the public revenue of a city must have been capable of erecting such splendid structures, the wealth of its private citizens appears to have been still greater than could have been anticipated from the national magnificence. The accounts of the riches of Gellias, Antisthenes, and other citizens of Agrigentum, are such as almost to stagger belief. The former, who lived in more than regal splendour, is reported to have had 300 wine cisterns, excavated in the rock of which the city is built, kept constantly full of the choicest wines; and at the marriage of the daughter of the latter, upwards of 800 carriages were in the nuptial procession. The return of Euxematus, a victor in the chariot-race of the 92d Olympiad, was celebrated with a splendour of which we can form no adequate idea; in proof of which it is enough to mention, that, among myriads more, no fewer than 300 carriages in the triumphal procession were drawn by white horses! (*Milford's Greece*, v. 387, 8vo. ed.)

It is much to be regretted that we have no authentic information as to the means by which such vast wealth was acquired. No doubt, however, it must mainly have been the result of extensive commercial and manufacturing industry; for, notwithstanding its great fertility, the territory belonging to the city was far too limited, and probably, also, too much subdivided, to allow of the accumulation of such gigantic private fortunes. It is clear, too, that a city possessed of such extraordinary riches must have had wisely contrived institutions, and been, on the whole, well governed.

This great city was founded, anno 580 a.c., by a colony from Gela, another Sicilian city, which had itself been founded by a colony of Cretans and Rhodians. (*Herod. vii. 153.*; *Thuc. vi. 4.*) Most probably its government was at first republican; but it early became subject to tyrants, or princes, of which Phalaris is one of the most ancient, and also the most celebrated. The accounts of him are, however, too much mixed up with fable to be relied on. After his death the republican form of government appears to have been restored, and maintained for a considerable period, till Theron, an able and politic citizen, attained to the supreme direction of affairs. This prince, having carried off the prize in the chariot race at the Olympic games, has been the theme of the glowing eulogy of Pindar:—

"Theron, hospitable, just, and great,
Famed Agrigentum's honored king,
The prop and bulwark of his towering state."

— *West. Pindar*, Ode li.

And he obtained and deserved the respect and esteem of the nation by his justice and moderation, and his success in defeating, with the aid of his son-in-law Gelon, the Carthaginians in a great battle. The construction of the piscina, and of other great works at Agrigentum, has, as already stated, been ascribed to the captives taken on this occasion.

After the death of Theron, who was succeeded by his son Thrasylus, a foolish and licentious prince, the Agrigentines once more asserted their independence, and established a republican government. During the invasion of Sicily by the Athenians, Agrigentum remained neutral, nor does history again mention it till a.c. 408, when, if we take Diodorus's account, it seems to have been most flourishing, the population being 380,000; but this, most probably, is much beyond the mark. At this time it was attacked, and blockaded by 120,000 Carthaginians, headed by Hamilcar, who desired to separate Agrigentum from the cause of Syracuse. After eight months' siege, the inhabitants were forced by hunger to evacuate the place during the night, and made for Gela, which they reached in safety. Hamilcar and his troops made Agrigentum their winter quarters, and in the following spring, every thing valuable was either taken to Carthage or sold. Timoleon, according to Plutarch, (rather a doubtful authority in these matters,) rebuilt the city a.c. 340, and, about 30 years after, the Agrigentines attempted to regain their ancient power in Sicily, but were defeated by the Syracusans. Its history during the Punic wars is very imperfectly ascertained. In the first, it was the ally of Carthage; and during the struggle which made Sicily the seat of war, it was alternately in the hands of the Romans and Carthaginians. Its later history must be learnt by a perusal of Cicero's orations against Verres, particularly the fourth of these eloquent invectives. Little more is known of the history of Agrigentum.

GIRONDE, a marit. dep. of France, and the largest in the kingdom, in the S.W. part of which it is situated; between lat. 44° 12' and 48° 35' N., and long. 0° 18' and 12° 15' W.; having N. the estuary of the Gironde, and the d'esp. Charente-inférieure; E. Dordogne; S. Lot-et-Garonne; S. Landes; and W. the Atlantic (Bay of Biscay). Length, N. to S., about 100 m.; average breadth, between 50 and 60 m. Area, 97,100 hectares. Pop. (1836) 555,800. There are a few hills in the E.; but the surface generally is level; and all its W. portion is a vast sandy flat, termed the "Landes," bounded towards the sea in its whole extent by a range of sandy downs, or *dunes*, adjacent to which extends a line of extensive lagoons and marshes. The coast has generally a remarkably straight outline, but near the S. extremity of the dep. it presents a considerable inlet, the *Bassin d'Arcachon*, which communicates with some of the lagoons before mentioned, and contains numerous islands. The port of La Teste de Buch is situated on its S. side. Chief rivers, Garonne, Dordogne, and the Isle and Dronne, affluents of the latter. The river or estuary of the Gironde, whence the dep. derives its name, is formed by the union of the Garonne and Dordogne, near Bourg. It has a N.W.W. direction to its embouchure in the ocean 45 m. distant. Its breadth varies from 2 to 5 m.; at its mouth, however, it is only 3 m. wide. It is navigable throughout; though at some points its bed is encumbered with sandbanks. "L'aspect du département est aride. D'un côté, ce sont des terres arides, et impropre à toute espèce

de culture; de l'autre, un pays riche et fertile, des plaines verdoyantes, des vallées délicieuses. Ici, des nombreux vignobles plus ou moins précieux; là, des marais malsains, des mers de sable nu, des forêts de pins n'offrant aucune pâture aux bétails affamés. Puis, au centre, une ville vaste, bruyante, populeuse; des bâtiments superbes, et des eaux profondes et rapides, sillonnées en tous sens par des milliers de vaisseaux." (Hugo.) It is stated that 326,410 hectares, or about 1-4d of the dep., consists of heaths and wastes; 228,355 hect. of arable land, 128,822 hect. of vineyards, and 106,709 hect. of woods. Only about half the corn necessary for home consumption is grown; it is chiefly wheat. The culture of the vine is by far the most important branch of industry carried on in this dep. The annual produce of the wines of Gironde, the red growths of which are known in Britain by the general name of *claret*, amounts to about 2,500,000 hectolitres, or about 55,000,000 imp. galls. The vineyards are the property of about 12,000 families, and the expenses of their cultivation are estimated to amount to 45 or 46 millions of francs a year. The best growths are from the confines of the "Landes," behind Bordeaux; the secondary growths are chiefly the produce of the country between the Garonne and Dordogne, and the *palus*, a district of a strong and rich soil bordering the banks of those rivers.

The first growths of the red wines are denominated *Lafite*, *Latour*, *Château-Margaux*, and *Haut Brion*. The first three are the produce of the district of *Haut Medoc*, N.W. of Bordeaux, and the last of the district called *des Graves*. These wines are all of the highest excellence: their produce is very limited, and in favourable years sells at from 3,000 to 3,500 fr. the tun, which contains 210 imp. gallons; but when they have been kept in the cellar for six years the price is doubled, so that even in Bordeaux a bottle of the best wine cannot be had for less than 6 fr. The *Lafite* is the most choice and delicate, and is characterised by its silky softness on the palate, and its charming perfume, which partakes of the nature of the violet and the raspberry. The *Latour* has a fuller body, and, at the same time, a considerable aroma, but wants the softness of the *Lafite*. The *Château-Margaux*, on the other hand, is lighter, and possesses all the delicate qualities of the *Lafite*, except that it has not quite so high a flavour. The *Haut Brion*, again, has more spirit and body than any of the preceding, but is rough when new, and requires to be kept 6 or 7 years in the wood; while the others become fit for bottling in much less time. (Henderson on Wines, p. 184.)

Among the secondary red wines, those of *Rozan*, *Goror*, *Leoville* and *Lorose*, *Bran-Mouton*, *Pichon-Longueville*, and *Calon* are reckoned the best. The third rate wines comprise those called *Pauillac*, *Margaux*, *St. Julien*, *St. Estèphe*, *St. Emilion*, &c. It is but seldom that any of these growths are exported in a state of purity. The taste of the English, for example, has been so much modified by the long-continued use of port, that the lighter wines of the Gironde would seem to us to want body. Hence, it is usual for the merchants of Bordeaux to mix and prepare wines according to the markets to which they are to be sent. Thus the strong rough growths of the *Palus* and other districts are frequently bought up for the purpose of strengthening the ordinary wines of *Medoc*; and there is even a particular manufacture, called *travail à l'Anglaise*, which consists in adding to each hogshead of Bordeaux wine three or four gallons of Alicante or Benicarlo, half a gallon stum wine, a bottle of alcohol, and sometimes a small quantity of hermitage. This mixture undergoes a slight degree of fermentation; and when the whole is sufficiently frothed in, it is exported under the name of claret. This mixture chiefly consists of secondary wines, the first-rate growths falling far short of the demand for them. (Henderson, p. 184.; see also *Julien, Topographie des Vignobles*, p. 203.) But even the first-class wines are frequently intermixed with the best secondary growths; and it is customary to employ the wines of a superior to mix with and bring up those of an inferior vintage. Hence we need not wonder at the statement of a gentleman who, after living twenty years in Bordeaux, doubted whether he had tasted more than three times, any pure wine of the first quality!

The white wines of the Gironde are of two kinds; those called *Graves*, which have a dry, flinty taste, and an aroma somewhat resembling cloves; of these, the principal are, *Sauternes*, *Borac*, *Frignac*, and *Langois*. These are said by *Julien* to be *très-melleux* or, *pour mieux dire, semi-liqueurs, et assez spiritueux*. The white wines of the Gironde have for several years past been advancing in estimation and value; and may be said, speaking generally, to come to us in a less adulterated state than the red wines.

About half the wines of the Gironde are sent to other parts of France; one fifth part is consumed in the dep.; one fifth is exported, the finest growths to England, but the larger quantity to the N. of Europe and Holland;

and about one fifth part is supposed to be converted into brandy.

A person accustomed to good society in London, and, indeed, in most other parts of the country, would be apt to conclude that French wines were consumed in England to the almost total exclusion of other wines. But any such inference would be in the last degree erroneous. The fact is, that French wines are rarely drunk, except by the upper classes, and their consumption is inconsiderable compared with that of the middle and lower classes. So much is this the case, that while, in 1839, 2,921,422 gallons of port, and 2,679,997 gallons of sherry, were entered for home consumption, the entries of all descriptions of French wines (including champagne, claret, and everything else) only amounted to 378,636 gallons! (*Parl. Paper*, No. 416, Sess. 1840.)

Some excellent fruit and good hemp are grown in this dep. The forests furnish a great deal of timber for deals and masts, together with resin, pitch, and turpentine. In 1835, 64,500 hectares consisted of meadow land; and in 1830, there were about 100,000 head of cattle, and nearly 370,000 sheep belonging to the dep.; but the rearing of live stock has never been much attended to in this dep. In 1835, of 178,272 properties subject to the *contribution foncière*, 79,651 were assessed at less than 5 fr., and 27,572 at from 5 to 10 fr. The number of considerable properties is about the average of the dep. There are no mines, but several furnaces and forges of considerable size, for the reduction and manufacture of metallic products. There are some stone quarries; a great deal of good turf is found, besides sand and clay suitable for the manufacture of earthenware; salt is obtained in the marshes of *Medoc*. The total annual value of the mineral products was officially estimated, in 1835, at about 4,500,000 fr. Manufactures very various; they include woollen and cotton fabrics, cordage, iron, steel, copper, gold, and silver articles, glass, pottery ware, liqueurs, &c. Sugar refiners and dyeing establishments are numerous; and many merchant ships are built at Bordeaux and elsewhere. For farther details respecting the trade, which is extensive, see *BORDEAUX*. The dep. is divided into six arrond. It sends 9 mems. to the Ch. of Dep. Number of electors (1838-39), 4,653. Chief towns, Bordeaux, the cap., Libourne, and Bazas. Total pop. revenue (1831), 39,994,548 fr.; expenditure, 17,959,814 fr. This dep. contains several fine Roman antiquities. It was ravaged by the Saracens in the 8th, and the Normans in the 9th century; it belonged to the English from the time of Henry II.'s marriage with Eleanor of Guenne, till it was annexed to the French crown by Charles VII. (*Hugo*); *Official Tables*; *Dict. Géog.*; *Encycl. des Gens du Monde*, &c.)

GIRVAN, a sea-port, market-town, and par. of Scotland, co. Ayr, on S. bank of the river of the same name, near its influx into the sea, 17½ m. S. Ayr, and 25 m. N. Stranraer. Pop. of par. in 1801, 2,960; in 1831, 6,430; and is now (1840) estimated at 7,000. The town (which contains five sixths of the pop.) commands a beautiful view of the sea, the N. coast of Ireland, the rock of Ailsa, the Mull of Cantyre, and the various islands lying in the Frith of Clyde. Though large, it is mean-looking, consisting mostly of houses of one story. The inhab. are mainly employed in weaving cotton for the Paisley and Glasgow manufacturers, the number of looms being about 2,000. The people are generally poor and ill lodged, so many as two or three families being, in some instances, crowded together in one end of a house, while the other is filled with the looms on which they work. No fewer than two thirds of the inhab. are Irish or of Irish extraction, attracted by the facility of learning the business of hand-loom weaving, and the miserable remuneration which it affords. It is not uncommon, while the father is working on the loom, for the mother and children to set out as beggars. While weaving is the staple business, both salmon and white fishing affords employment to not a few, and is yearly being prosecuted with greater energy. The harbour has lately been improved by the erection of a new quay, and both grain and coal are exported to a considerable extent. There are two branch banks in the town; and five schools in the par., exclusive of the parochial school, in which ten boys and ten girls are educated gratuitously, on an endowment left for the purpose by Mrs. Crawford of Ardmillan. There are also two subscription and two circulating libraries; and twelve friendly societies. (*New Stat. Acc. of Scotland*, 4 Ayr, p. 894.) Girvan was erected into a bor. of barony in 1668; but, owing to its diminutive size, the charter lay dormant till 1785.

GIULIANO (SAN), a town of Sicily, Val-di-Trapani, occupying the site of the ancient Eryx, on the summit of the mountain of the same name, 5 m. N.E. by E Trapani, and 40 m. W. by S. Palermo. Pop. (1831) 10,249. It has 9 convents, 15 churches, an hospital, and a *spedale di pietà*. From its elevated situation it commands a fine prospect, and has a pure atmosphere: the inhab. enjoy excellent health, the women being remarkable for their beauty and clearness of complexion; a circumstance

which rendered it an appropriate situation for the temple of Venus, which existed here in antiquity. *Mons Eryx*, on which the temple was built, rises 2,176 ft. above the level of the sea, and was said by Polybius to be the largest mountain in Sicily, Etna excepted; and he adds that the temple far excelled all the other temples in the island, in splendour, wealth, and magnificence. (*Lib. i. § 55.*) The accounts of the origin of this famous temple are obscure and contradictory. According to Virgil it was founded by *Æneas* (*Æneid*, lib. v. line 760.); and at all events it was extremely ancient, as *Dædalus* is said to have built the Cyclopean walls that surround part of the mountain, and to have enriched its treasury with some extraordinary works of art. The votaries of the goddess, thence frequently called *Venus Erycina*, including persons of the highest distinction, resorted thither in crowds, not only from all parts of Sicily, but also from Italy and Greece. It was, in fact, one of the most celebrated seats of superstition, pleasure, and dissipation in the ancient world. According to *Diodorus Siculus*, 17 cities contributed to the support of the temple, the priestesses of the goddess were slaves, but some of them became rich enough to purchase their freedom. The temple was plundered by *Hamilcar*, a Carthaginian general, who, being afterwards taken by the Syracusans, expiated his sacrilege by the most cruel torments. But this seat of superstition and debauchery having lost its attractions, was in *Strabo's* time nearly deserted. It was, in some measure, restored by *Tiberius*; but it never recovered its former splendour, and was in a very lengthened period wholly abandoned. (See the article on this temple in the learned *Mémoire sur l'Éryx*, by *Larcher*, pp. 188–194., and the authorities referred to in it.)

"Eryx is at present an abrupt and sterile mountain, with but few vestiges of its former magnificence; those still existing are principally a few granite pillars, and some remains of a Cyclopean wall; there is also a kind of cistern, now dry and filled with weeds and brambles, in the castle court, called the well of Venus; and coins, vases, amphore and patera, are frequently found, as are also many leaden bullets, for slings, inscribed with imprecations." (*Smyth, Sicily*, p. 342.) Wild pigeons still resort to the mountain in great numbers, as in ancient times.

GIURGEVO, a town of Wallachia, on the N. bank of the Danube, opposite Rutchuk, and 38 m. S.S.W. Bucharest. Pop. 15,000. It is a miserable place, composed of dirty, narrow streets, and houses built of mud, with here and there one a little more pretending in its appearance, ornamented by a wooden verandah. It was formerly fortified, but its ramparts were levelled by the Russians in 1829. The coffee-houses are numerous, and apparently afford more comfort than the private residences. "The principal square contains a tall quadrangular tower, surmounted by a bell, which sounds at certain hours, and is misnamed a clock; but, with the exception of this appendage, the square differs little from a large courtyard surrounded by Irish cabins. *Giurgevo* carries on a considerable trade with some of the Austrian towns; and a great part of the commerce of Bucharest, of which it may be regarded as the port, flows through it." (*Elliott's Trav. in Austria*, &c. i. 177.)

GIVET, a town of France, dép. Ardennes, cap. cant., on both sides the Meuse, close to the Belgian frontier, 25 m. N.N.E. Mézières. Pop. (1836) 4,273. Its divisions are connected by a fine stone bridge of 6 arches; and both are fortified. The town is in general well-built, especially the grand square. Among the public buildings are commodious barracks, in which English prisoners were detained during the last war; a military hospital, and a public library with 5,000 vols. Givet has a tolerable port, a brisk trade, and manufactures of acetate of lead, sealing-wax, glue, earthenware, pipes, and leather. In its canton is the gorge, ½ m. in length, through which the Meuse flows; a three overhanging rocks on either side of which are called the *Dames de Meuse*.

GLADOVA (Turk. *Fet-Zalam*), a town of Servia, on the Danube, immediately below the "Iron Gate," and at present one of the chief stations of the Danube Steam Navigation Company. It is destitute of any house capable of affording accommodation to travellers, being a mere collection of wretched huts. Its inhabitants find constant employment in the conveyance of merchandise, &c. by land to and from Orsava, the station above the rapids of the Danube, a journey of nearly 10 m., which most passengers perform by land. About 2½ m. below Gladova are the remains of Trajan's Bridge. (See DANUBE.)

GLAMORGAN, a co. of S. Wales, being the most southerly in the principality, having S. the Bristol Channel, &c. the Co. of Monmouth, from which it is separated by the Renny, N. Brecknock, and W. Caermarthen. It is about 52 m. in its greatest length W. to E., and 28 m. in its greatest breadth. Area, 606,880 acres. On the N. and N.E. it is mountainous; but its S. portion, consisting

of the vale, or, more properly speaking, great level of Glamorgan, stretching from the mountains to the sea, is by far the most fertile part of S. Wales. The soil of this level is a reddish clay resting on a limestone bottom, and is most excellently adapted for the growth of wheat. But the agricultural capacities of this co. are surpassed by its all but inexhaustible mineral treasures. In fact, the whole of this co., N. of Llantrisant, is comprised within, and forms the largest portion of, the coal basin of S. Wales—the greatest depot of coal in the empire; and capable, it is believed, of alone supplying its present rate of consumption for above 2,000 years! This has also inexhaustible supplies of lime and ironstone; and is the seat of the Merthyr-Tydvil, Aberdare, Hirwaun, and numerous other iron works, the greatest establishments of their kind in the empire. The energies of the inhab. being thus principally directed to mining pursuits, agriculture is not in a very advanced state. A great deal of excellent wheat is, however, produced; barley, oats, and potatoes being the other principal crops. Lime is the principal manure. Estates and farms vary very much in size; the latter are most commonly held under leases of 7 or 14 years. The hills afford good pasture for sheep and cattle, and great quantities of cheese and butter are made. The Glamorgan cattle are the largest of the Welsh breed. Recently they have been crossed with the Ayrshire breed; and the mixed breed thence resulting are found to yield a greater quantity of milk than the old Glamorgan; at the same time that they are harder, and can be kept at a good deal less expense. Average rent of land, in 1810, 8s. 4½d. an acre. The cottages in this co. are said to be amongst the best in the empire. The custom of white-washing houses, office-houses, walls, &c. is universal; and it is alleged that, occasionally, even hedges have been subjected to this favourite operation. Principal rivers, Tawe, Neath, and Taf. There are several canals and railways in the co., by which an easy communication is kept up between the mining districts in the N., and the ports of Swansea, Neath, Cardiff, &c. Near Swansea and Neath are the greatest smelting works in the empire. Cardiff is the principal port in Glamorgan, not only for the shipment of coal and iron. Principal towns, Merthyr-Tydvil, Cardiff, Swansea, and Neath. This co. returns 5 mems. to the H. of C., viz. 2 for the co., 1 for Merthyr-Tydvil, and 1 each for Cardiff and Swansea and their contributory bors. Registered electors for the co., in 1838–39, 4,494. Glamorgan is divided into 10 hundreds, and 118 parishes. In 1831, it had 28,943 inhabited houses; 26,111 families; and 126,612 inhab., of whom 63,284 were males, and 63,328 females. Sum contributed to the relief of the poor, in 1838–39, 28,380*l*.

GLARUS, or GLARIS, a canton of Switzerland, in the E. part of which it is situated, and ranking seventh in the confederation; between lat. 46° 47' and 47° 10' N., and long. 8° 51' and 9° 15' E.; having N. and E. the cant. St. Gall, S.E. and S. the Grisons, and W. Uri and Schwytz. Length, N. to S. 27 m. Area, 278 sq. m. Pop. (1838) 23,348, of whom 25,548 were Protestants. This canton is one of the most rural in Switzerland, not only in its geographical position and natural features, but also in its political constitution, and some of its laws and usages. Its central portion consists of the long narrow valley of Linth, into which there is but one road; and of two small lateral valleys, to neither of which there is any access but by the principal valley. The rest of the surface is mostly covered with mountains belonging to different ranges, which, in general, rise higher than those in the neighbouring cantons. The Doedlberg, at its S. extremity, the loftiest summit in E. Switzerland, is 11,765 ft. in height; the Glarnish is 9,630 ft.; and the Wiggle, 7,444 ft. high. The Linth, its principal river, rises beneath the Doedi, and runs in a N. direction through the whole canton, into the lake Walenstadt, which forms a part of its N. boundary. Besides this and the lake of the Kionthal, there are many other small lakes in the mountains. Glaciers are also numerous, and the scenery generally is very striking. According to *Ebel*, not 1–10th part of the land is arable: orchards of plum, pear, cherry, apricot, almond, and other trees, are sufficiently plentiful, and in some parts the vine is cultivated; but very little grain, or other agricultural produce, is obtained. The pasturages on the mountain sides are fine, and feed during the summer about 10,000 cows and 5,000 sheep. A great many goats are kept. This canton is the peculiar seat of the manufacture of *Schabziger*, or green cheese. This article is made of cows' milk, and not of goats', as its name might seem to imply. The peasant, who feeds their cows in the mountains, bring down the curd in sacks, each containing about 200 lbs., for which they get about 80s. The cheese owes its peculiar appearance, smell, and flavour to the blue panay (*Germ. Kle; Trifolium Melilotus caerulea*). This herb is grown in small enclosures beside most of the cottages; dried, ground to powder, and in that state thrown into the milk along with the curd, in the proportion of 3 lbs. of herb to 100 lbs. of the latter, after being turned for about 24 hours, the mixture is ready to be put into shapes.

where it is kept until it dries sufficiently to be ready for use. When sold wholesale, it fetches about 34d. per lb. This is considered a very lucrative trade; and the richest people in the canton are cheese manufacturers. A good deal of Schabzieger cheese is exported to America. The possessor of 20 or 25 cows in Glarus is considered to be in very easy circumstances, and yet his whole property does not amount to more than 160*l.*, the usual price of a cow being 7*l.*, or 8*l.* at most. But with a single cow, and a little potato land, or with 3 or 4 goats, an individual is above poverty. A person possessing property to the amount of 3,000*l.* is considered very wealthy, and there is not one in the canton worth 8,000*l.* (*Englis.*) The woods, which chiefly consist of fir and beech trees, belong for the most part to the communes. They have, however, been ill managed, and timber has become dear. Several mines of copper, iron, and silver exist, but they are not wrought. Fine black and other marbles, slate, quartz, gypsum, &c. are found, and there are some sulphureous springs. The inhab. are very active and industrious: they manufacture cotton and linen goods, print muslins, &c., pretty extensively, and are endeavouring to establish silk manufactures. They formerly traded in the more precious European woods, and marquetry-work; but the demand for these has greatly diminished. The chief exports of Glarus are about 2,000 head of cattle and 200 or 300 horses annually, Schabzieger and other kinds of cheese, butter, honey, dried fruits, manufactured articles, slates, &c. The principal imports are corn, wines, salt, metals, wool, colonial produce, glass, earthenware, and straw hats, muslins, silks, and Lyonsese goods, which the traders sell in the fairs of Italy, Germany, and the N. of Europe. It is estimated that 1-30th part of the pop. are engaged in business out of the canton; some travel for Zurich merchants, and others on their own account; and natives of Glarus are settled in many of the large commercial cities of Europe. The cant. is divided into 15 *tagewen* or communities; chief towns, Glarus, Mollis, Schwanden, and Ennoda; the last has risen up since 1780 to be a place containing 2,000 inhab., the most thrifty in the canton. The constitution is purely democratic. The government is in the hands of the whole body of the male pop. above 16 years of age, being from 600 to 7,000, who meet annually on the first Sunday in May, in a general assembly, to appoint their magistracy, &c., and to accede to or reject the laws proposed to them by the executive body. The latter consists of a council of about 80 members, of whom 3-4ths are Protestants, and the remainder Catholics. The two persuasions enjoy the same rights, and alternately elect the presidents of the general assembly and council. Some very singular laws prevail in Glarus. One is, that only a son or daughter can inherit property, unless such have been purchased by the testator. Property so lapsing belongs to the government, by which it is let out to the poor at the rate of 15 batzen (2*d.* 1*d.*) for 36 ft. sq. A large proportion of the land is held in this way, and generally planted with potatoes or *Bühe* pansy. This law gives general satisfaction. The laws respecting marriage are curious. Whatever may be the age of persons desirous of marrying, they cannot do so without the consent of their respective parents. "A man of 60 must still remain a bachelor, if his father of 75 should so determine." (*Englis.*) This law is, however, partially neutralised by another. If a young woman is *enchantée*, the person in fault is obliged to marry her; or, in case of a refusal, he is declared incapable of being elected to a seat in the council; his evidence is inadmissible in a court of justice; and, in short, he is deprived of civil rights. Both the Catholic and Protestant clergy are paid by the government; but the strictest economy prevails in all the public departments; the chief magistrate receives but 30*l.* a year! Taxation is very low; the state-expenditure is defrayed by a poll-tax of 4 batzen (about 6*d.*) upon every one above 16 years of age; a property-tax of 2 batzen upon 1,000 *florins*, rent, or state-property, customs, post-office, excise, fines, &c. There is no direct poor-law, but something very like one. On Sundays there are what are called *voluntary subscriptions* for the poor; but if any one known to have the means of giving be observed not to give, he may be summoned before the council, and compelled to contribute. There are one or more schools in every commune, for the ordinary useful branches of education, the masters of which are paid by government about 35*l.* a year. Parents are obliged to send their children to school; but all instruction is gratuitous. Glarus furnishes 482 men to the army, and 3,615 Swiss francs to the treasury of the Swiss confederation. Public revenue (1826) 26,226 *florins*; expenditure 17,301 *florins*. As early as the 8th century, the territory of Glarus belonged principally to the abbey of Seckingen on the Rhine; but it fell in the 13th century into the possession of the house of Austria. In 1351, it was occupied by the troops of the confederated Swiss cantons, and soon afterwards joined the confederacy; its independence being consolidated by the memorable battle of Näsfield, in 1386. After the reformation, it was the seat of continual religious wars; and in 1793, was the

theatre of a contest between the Austrians and Russians and the French. The historian, Tschudi, was a native of this canton. (*Helvetic Almanack; Ebel; Cassinabich; Lutz. Geog. and Statist.; Picot; Inglis's Switzerland.*)

GLARUS, a town of Switzerland, cap. of the above cant., in the narrow valley of the Linth, between two Alpine mountain ranges, 33 m. S.E. Zurich, and 64 m. S. the Lake of Wallenstadt. Pop. 4,320. The town is well built, and cheerful; the houses, many of which are antiquated, are chiefly of stone, and frequently ornamented on the outside with fresco paintings. The par. church, an old Gothic edifice, is used by both Protestants and Catholics. The Linth is here crossed by two bridges. Glarus has an hospital, town-hall, a free school for 700 children, erected by private subscriptions; public library, and reading-room. Most of its inhab. are engaged in commerce, and it has a brisk trade; besides manufactures of printed cotton goods, muslins, woollen cloth, and Schabzieger cheese. (*Ebel; Picot, &c.*)

GLASGOW, a city, river-port, and the most populous and important manufacturing and commercial town of Scotland, co. Lanark, on both sides the Clyde, 42 m. W. by S. Edinburgh, and 18 m. E.S.E. Greenock; lat. 55° 51' 32" N. (Macfarlane's Observatory), long. 4° 17' 54" W., being about 8 m. farther S. than Edinburgh. The greatest extent of the city from E. to W. is nearly 4 m., and from S. to N. nearly 3 m. The site on which Glasgow is built is a dead level on the S. of the river, and also for about ½ m. on the N., after which the ground rises with considerable rapidity, till, at the extremity of the town in this direction, it is 150 ft. above the level of the Clyde. The portion of the city on the S. bank of the Clyde, called the Gorbals, had, in 1801, a pop. of 35,194. Its situation, shape, and fine river, gives Glasgow a striking, though miniature resemblance to London. Pop. (1831) 202,426: viz., males, 93,724; females, 108,702; excess of females, 14,978; families, 41,965, averaging 4·82 to each family. At present, 1840, the pop. may be estimated at from 280,000 to 290,000. (*See post.*)

The original town was built on the rising ground, as an appendage to the cathedral erected in the 6th century (by Kentigern or St. Mungo, the tutelary saint of the city), on the banks of the river, intersected by the Molindrin burn, which formed, for centuries, the W. boundary of the town. From this point the buildings gradually extended downwards till they occupied the whole of the intervening space N. of the Clyde, and ultimately in every direction, including the large suburb (the Gorbals) S. of the river. Other extensive suburban villages, such as Calton, Anderston, Cowscaddens, &c., are now regarded as forming part of the city, being continuously attached to it. The houses both of the city and suburbs are of stone, covered with slate. The principal street, running E. and W. parallel to the river, bearing the several names of Argyle Street, Trongate, and Gallowgate, is above 14 m. in length; and, though not of uniform width, is every where of ample dimensions. It is lined on either side with well-built houses, from 3 to 5 stories in height, having handsome shops on a level with the causeway; and is, in fact, one of the finest streets and most crowded thoroughfares in Europe. Parallel to these are many fine streets, as Ingram Street, St. Vincent Street, George Street, &c.; and these are intersected by other streets running N. and S., of which the principal and most ancient is the High Street and Saltmarket. Glasgow is in one respect decidedly superior to London, both sides of the Clyde being bordered by fine quays; and Carlton Place, on its S. side, is one of the finest ranges of buildings in the city. All that part of the city W. of George's Square, and N.W. from Argyle Street to the canal, is comparatively modern. Here, within the last 40 or 60 years, a city, of noble streets, squares, and palaces, has been raised. Blythswood Square, on rising ground N. from the Broomfield, is splendidly built, and may be regarded as the most fashionable part of the town—the Belgrave Square of Glasgow. The other principal squares are St. Andrew's, St. Enoch's, and St. George's. On the extreme W. of the city, on elevated ground, is Woodside Crescent, a splendid range of buildings, commanding an extensive view of the basin of the Clyde, and the adjacent country.

But we regret to have to add, that while the newer and more fashionable parts of Glasgow will bear a comparison with the finest quarters in any of our most splendid cities, it has other quarters which do not rank above it. If they be not below, the worst parts of the liberties of Dublin, St. Giles's in London, or the *wynds* leading from the High Street in Edinburgh. The principal district of this sort lies in the centre of the city, between the Trongate on the N., the Saltmarket on the E., the Clyde on the S., and Stockwell Street on the W. It consists of a labyrinth of narrow lanes or *wynds*, whence numberless entrances lead off to small square courts or "*closes*," which usually have a dughill in the centre. These *wynds* and courts are formed of old, ill-ventilated, and mostly dilapidated houses, varying from two to four stories in height, with-

out water, and let out in stories or flats; one of the latter often serving for the residence of two or three families. Frequently, however, the flats are let out in lodgings, as many as 16 or 20 individuals being occasionally found huddled together in a single room. (*Symons on Artizans*, &c., p. 116.) The whole district is occupied by the poorest, most depraved, and worthless part of the pop. Filth, destitution and misery, prevail to a frightful extent; and it may be regarded as the grand source of those pestilential fevers that thence spread their destructive ravages over the entire city. There are similar, though less extensive, districts in other parts of the city, off the High Street, in the Calton, &c.

In 1817 gas was introduced into the city: the works occupy an area of 14,831 sq. yds. of ground. The charge for gas per metre is 9s. per 1,000 cubic feet, subject to a progressive discount, varying from 5 to 30 per cent., according to the quantity consumed. The city was served very inefficiently with water by public and private wells till 1806, when the "Glasgow Water Company" was formed by act of parliament. Another company was incorporated in 1804: and lately an act of parliament was obtained for uniting these companies. The revenue of the united company, in 1836, was 25,302*l.* 13*s.* 9*d.* The water is got from the Clyde; quantity furnished daily, 8,218,000 imp. galls. Lowest charge per family, 5*s.* 6*d.* per annum, rising on a graduated scale to 13*s.* on houses rated at 10*l.*; above 10*l.* of yearly rental, 6*d.* per cent. on rental. Public works varying from 6*d.* to 12*d.*, 10*s.* per annum for a daily supply of 1,000 imp. galls. An excellent market-place for the sale of cattle was established in 1818.

Glasgow can boast of many magnificent public buildings; of which the cathedral, or high church, is entitled to the first notice. The original edifice, built by St. Mungo, having gone to decay, the present structure was begun by John Achaicus, Bishop of Glasgow, in 1133, in the reign of David I., but was not completed for upwards of three centuries. As the building stands on an "elevation" (on the W. bank of the Molindinar Burn), 104 ft. above the level of the Clyde, it is seen at a great distance in almost all directions. It is a large oblong structure, in what is called the early English style, which, notwithstanding the different areas of the building is said by Mr. Rickman to be well kept up, and to be excellently designed and executed. Its great length, from E. to W., is 319 ft., the breadth 63 ft., the height of the choir 90 ft., and of the nave 85 ft. A square tower, which rises from the centre of the building to the height of 30 ft. above the roof, is surmounted by an octagonal tapering spire, terminating in a ball and vane 225 ft. above the floor of the choir. There is another low tower at the W. end of the N. aisle. It is said to have in all 157 windows, many of which are of exquisite workmanship. The crypt, under the choir and chapter-house, is said, by Mr. Rickman, not to be equalled by any in the kingdom. "It is, from the fall of the ground, well lighted, and is an uncommonly rich specimen of early English." It was formerly used as a church, but since 1768 has been used as a cemetery only. This venerable and magnificent structure, the most perfect by far of the ancient religious edifices still existing in Scotland, narrowly escaped falling a sacrifice at the era of the Reformation to the destructive zeal of the mob; but was fortunately saved by the timely and vigorous interposition of the trades. It has recently been determined to have it thoroughly repaired and renovated; the expense to be defrayed partly by government, and partly by subscriptions from the corporation, and other public bodies, and private individuals. It formerly contained the churches of one of which, as already stated, was situated in the crypt; but now it contains only one. The bishop's palace, or castle, as it was called, erected in 1430, stood to the S.W. of the cathedral, and was enclosed with a strong wall of stone. The ruins were removed, in 1789, to make way for the erection of the infirmary, one of the finest buildings in the city. Most of the churches, both established and dissenting, are fine buildings, particularly St. Enoch's, St. Andrew's, St. David's, and the Tron. St. Andrew's episcopal chapel, and the R. Catholic chapel, a magnificent Gothic edifice, in West Clyde Street. The University, including the houses for the accommodation of the professors, situated on the E. side of the High Street, is of great extent, having a front of 305 feet to the High Street, and extending 482 feet from E. to W. These buildings, occupying 4 quadrangular courts, are generally three stories high, diversified with turrets and appropriate ornaments. In connection with the college and near it, on the E.E., is the Hunterian Museum, erected in 1804, and exhibiting one of the most perfect specimens of a pure classical building to be found in the empire. It was built from funds left for the purpose by the celebrated Dr. William Hunter, a native of the parish of Kilbride, near Glasgow, for the reception of the museum he bequeathed to the university. This princely donation comprises a library of from 10,000 to 12,000

vols., embracing many rare and splendid editions of the classics, and of other standard works; a choice, and not easily matched collection, of Greek and Roman coins and medals; a collection of about 60 capital pictures; and a magnificent collection of anatomical preparations, shells, minerals, zoological specimens, &c. This truly noble museum is said to have cost Dr. Hunter 100,000*l.*, and since it was placed in its present situation it has received many additions. The adjoining ground on the E. of the college, though called the College Garden, is a park containing several acres, enclosed by a high wall, and laid out in walks for the use of the professors and students. The Macfarlane Observatory stands near its E. end; but a new observatory is now being erected on the Gorbals side of the Clyde. The new Royal Exchange, in Queen Street, is a splendid fabric, built in the florid Corinthian style, and surmounted by a lantern, one of the most conspicuous objects in the city. The colonnade, one of the boldest and most imposing structures of the kind in the kingdom, consists of a double row of fluted Corinthian pillars of great height. The apartment devoted to a news-room is of great size and magnificence, being 100 feet long by 40 broad, with a richly ornamented arched roof, supported by fluted pillars. The Royal Exchange is placed in the centre of an area, two sides of which are lined with splendid and uniform ranges of buildings; while behind it is the Royal Bank, a Grecian structure, much admired for the elegant simplicity and chasteness of the design. On each side of the bank, two superb Doric arches afford access to Buchanan Street, one of the principal streets of the city. Amongst the other public buildings are the gaol and court-houses; the town-hall, and town-council buildings, at the E. end of the Tron-gate, opposite the statue of William III. Both these buildings are handsome structures; the latter was constructed in 1781, as its name implies, by a company of subscribers, on the principle of survivorship. The news-room on the lower floor is of very large dimensions, and, previously to the erection of the new exchange, was the great resort of the mercantile body: the upper part is occupied as an hotel. The lunatic asylum to the N. of the city is a large and also an elegant structure, admirably adapted for its purpose. The bridewell, merchants' hall, town hospital, trades' hall, assembly-rooms, the Andersonian university, high school, surgeons' hall, barracks, theatre, Hutcheson's hospital, house of refuge, lyceum, &c., deserve notice. It may here be stated that, in 1831, there were 3,184 shops of all kinds in the city and suburbs; and that the number is now supposed to be nearly 4,000. The highest rent paid for a shop was 250*l.* per annum. In 1712, the highest rent of a shop was 5*l.*, the lowest 12*s.*: the average a little more than 3*l.*

In connection with public buildings, may be mentioned the bridges over the Clyde, 4 in number, exclusive of a timber bridge for foot passengers. The first bridge over the river was constructed in 1345. It was originally only 12 ft. wide, and consisted of eight arches; but its width has been increased (1771), and two of its arches built up. Of the other bridges, the newest and most superb is Glasgow Bridge, built in 1806, on the site of a former bridge, removed for the purpose. It is of Aberdeen granite, 560 ft. long, and 60 ft. wide over the parapets; and is not only one of the greatest ornaments of the city, but is said to be wider than any other bridge in the United Kingdom.

Public Monuments.—Of these may be enumerated an equestrian statue in bronze of William III., erected at the Cross in the Tron-gate, the gift of James Macrae (1759), a citizen of Glasgow, and governor of the presidency of Madras; an obelisk in honour of Lord Nelson, in the public green; a statue of Sir John Macgregor (a native of Glasgow), in bronze, on a granite pedestal, by Flaxman; a similar statue of James Watt, by Chantrey, both in George Square. In the centre of the same square, is an elegant fluted Doric pillar, about 100 ft. high, in honour of Sir Walter Scott, with a colossal statue of the great minstrel at the top; in the town-hall is a statue of William Pitt, in marble, by Flaxman. Money to the amount of nearly 10,000*l.* has been subscribed for the erection of a triumphal arch to be surmounted by an equestrian statue of the Duke of Wellington. These monuments are exclusive of those in churchyards, of which there are 30 in the city and suburbs. The Necropolis, formed by the Merchant Company, in 1830, in an elevated park, (rising suddenly to the height of 200 ft., and situated on the E. of the Molindinar Burn, opposite the cathedral), in imitation of the cemetery of Père-la-Chaise in Paris, is unrivalled for picturesque effect. It occupies 7,800 square yards of ground, and is laid out with the greatest taste and judgment. Of many elegant monuments which this cemetery contains, an obelisk erected on the summit of the eminence, in honour of John Knox, surmounted by a statue of the reformer, is the most striking: like the cathedral, it is visible at a great distance in every direction.

The *Green* may be appropriately noticed in this place.

This, which is the Hyde Park of Glasgow, lies between the Clyde and the Calton and Bridgeton, and contains about 135 acres, appropriated to the recreation of the citizens. It has latterly been very much improved; the public washing-house having been removed to a more convenient situation, and a carriage drive carried round its circumference.

Eccelesiastical State.—Glasgow contains 12 parochial churches, the clergymen of which are paid by state endowments, each receiving an annual stipend of £431, except the ministers of the cathedral and Barony parishes, whose incomes, arising from tithes, and including their glebes, amount to about £600. The deficiency of parochial churches has been recently supplied by the erection of chapels-of-ease, or supplementary parishes, *quoad sacra*, the incomes of the clergymen of which arise either from the proceeds of church sittings, or from a given amount of stipend, secured by a bond voluntarily entered into by certain leading persons connected with the separate parishes. The number of these *quoad sacra* parishes is very great. The Barony parish, with a pop. (in 1831) of 77,485, but with only one parochial clergyman, has been so subdivided that it contains no fewer than 16 such supplemental parishes, each with a separate pastor. The parish of Gorbals, with a pop. of 33,194, contains 3 such parishes; while the remaining parishes embrace 9: total of parishes, including both the civil and *quoad sacra* parishes, being 40. The number of dissenters is also very great: comprising 12 congregations belonging to the United Associate Synod; Relief Synod, 10; Original Burghers, 1; Original Seceders, 1; Reformed Presbyterians, or Cameronians, 2; Independents, 4; Baptists, 6; Episcopallians, 4; Wesleyan Methodists, 3; United Methodists, 1; Unitarians, 1; Roman Catholics, 7 clergymen; Quakers, Jews, Boreans, New Jerusalem Church, and two others, 1 congregation each: total, 58. The established, as well as many of the dissenting, clergymen have numerous assistants and missionaries employed under them in the work of pastoral superintendence. These parishes and congregations embraced, in 1831, a pop. of 213,810, including some districts contiguous to, but not reckoned as in, the city. According to the return of the parochial clergy, 90,198 belonged to the estab. church, 100,539 to other denominations: while 14,072 were not known to belong to any congregation. On the other hand, according to a return of a committee of dissenters, 22,460 belonged to the estab. church, 110,055 to other denominations; while 11,295 were not known to belong to any congregation. (*Second Report of the Royal Church Commission, 1838.*) Of those not belonging to the estab. church, 26,965 were, in 1831, Roman Catholics; and "their number," says Dr. Cleland, "has increased considerably since." (*New Stat. Account of Scotland, art. Glasgow.*) The commissioners state (referring to all sects), "that there would appear to be about 65,178 persons in the habit of attending public worship, out of a pop. of 213,810; and that a very large number of persons, upwards of 66,000, exclusive of children under ten years of age, are *not* in the habit of attending public worship, in the sense in which that term is understood by the ministers of the several congregations; and after making an allowance for old and infirm persons, and those who may necessarily be absent, that number cannot be stated at less than 55,000." It appears from the same report, that, including every place of worship, the aggregate number of seats unlet or not allocated, was 19,648. The relative numbers of the different sects may be seen from the following table, which includes a list of baptisms, including births of the children of parents who disapproved of infant baptism, for the year ending 15th Dec. 1830. (*Cleland, ut supra, p. 8.*)

<i>Children baptized in 1830,</i>	
By clergymen of the Church of Scotland -	3,123
Do. of the United Associate Synod -	554
Do. of the Relief Synod -	671
Do. of the Roman Catholic Church -	915
Do. of the Episcopal Church, Methodists, Independents, and other denominations, including births among Baptists, Quakers, Jews, &c. -	1,024
Total -	6,397

Education.—Under this head the university claims the first attention. It was founded by Bishop Turnbull, by a papal bull, dated 1450; and its privileges have been subsequently confirmed and extended by royal charters and parliamentary statutes. The discipline of the university is administered by the court of the rector (or vice-rector), and by assessors nominated by him, who have for many years been the principal, and all the professors. The public affairs of the university are under the management of the senate, which is composed of the rector, dean of faculties, the principal, and all the professors, the latter being 31 in number. The business of the college, as a subordinate corporation, is conducted by the principal and 13 professors, called the Faculty, who, with

the rector and dean, dispense the college patronage. The rector, who is generally an eminent literary or political character, who seldom resides, or even appears, except at his inauguration, is chosen annually by the matriculated students. The office, which is now one of distinction only, has been filled by Durke, Adam Smith, Francis Jeffrey, Sir Robert Peel, &c. There is also a sinecure officer, named chancellor, nominated for life by the senate, who is generally a nobleman of distinction. The chancellor appoints a vice-chancellor, but neither has any rights or privileges either in the discipline of the institution or in the exercise of its patronage. In addition to the 31 professors, there is a lecturer on the structure, functions, and diseases of the eye. Government has also (1840) instituted a professorship of mechanics and civil engineering, and endowed it with a salary of 250*l.* a year. The principal presides as chairman at meetings of the senate, and generally over the institution, and is honorary professor of theology, but teaches no class. The crown is patron of the principality, and of 14 professorships, including that newly instituted; the faculty, rector, and dean, being persons among the remaining 6 professorships. The professors derive their incomes partly from the fees paid by the students (which vary from 3 to 5 guineas), and partly from funds (which amounted, in 1824, to 9,406*l.* a year) belonging to the college. In addition to these sources of income, government annually gives a grant, varying in amount, to augment the income of several of the chairs. It is required by law, that the principal and all the professors be members of the established church: the law, however, is not strictly enforced, except in the case of the principal and theological professors. Religious distinctions are of no consequence in the case of students; those only who belong to the national church and whose parents do not live in town, are required to attend public worship in the College Chapel. The curriculum is divided into the four faculties of Arts, Divinity, Medicine, and Law; which last is confined to a single professorship. There is only one session in the year, beginning 10th Oct., and terminating 1st May. There are 29 bursaries, the benefits of which are extended to 65 students. Their average annual income is 1,163*l.* 10*s.* 4*d.*; the highest is 50*l.*; the lowest, 4*l.* 10*s.* Mr. Snell, of Warwick, who has been twice elected, left a landed estate in that county, for the purpose of founding ten exhibitions in Balliol College, Oxford, in favour of students of the Episcopal Church, who have attended at least two sessions at the university of Glasgow, or one session there, and two at some other Scotch university. Among the distinguished persons who have been educated on Snell's foundation, may be mentioned Dr. Douglas, Bishop of Salisbury; Adam Smith; and Dr. Matthew Baillie. Each exhibition is of the yearly value of 182*l.*, and lasts for ten years. As in the other Scotch universities, there are no apartments for the residence of the students within the college. The number of students varies from 1,000 to 1,200. The graduations during the last year were as follows:—in arts, 22; in medicine, 117; in surgery, 19. The university library, which was founded in the 15th century, contains nearly 100,000 volumes, and is open to the students. A valuable botanical garden, consisting of 8 acres, on the W. of the city, was instituted by the united contributions of the government, the university, and the citizens of Glasgow, for the use of the professor of botany, who lectures in a hall erected within its precincts. Some of the most illustrious names in the literature of Scotland have been professors in the University of Glasgow: amongst others may be specified Hutcheson, Adam Smith, Simson, Millar, and Reid.

Anderson's University, or Andersonian Institution, was founded by Dr. John Anderson, Professor of Natural Philosophy in the University of Glasgow, who died in 1796, leaving his effects, including his museum and philosophical apparatus, to the institution. It is under the management of 81 trustees, who elect successors to those who retire. It possesses a fine building in George Street, embracing suitable class-rooms, a large hall, chemical rooms, and a museum. It consists of three distinct departments:—1. General branches for youth, consisting of mathematics, logic and ethics, natural philosophy, chemistry, French, geography, drawing, and painting. 2. A medical school, embracing all the branches for the various colleges of surgeons, and public boards. 3. Mechanics' classes, comprising 56 lectures on mechanics and chemistry, in alternate winters, and drawing. Excepting those in the mechanics' classes, the lecturers pay rents for their rooms. There is a good library, to which the students have access. The classes for mechanics in this institution were the *first* established in the empire.

The Glasgow mechanics' institution was founded in 1823, chiefly by some members of the mechanics' class in Anderson's University, who felt dissatisfied with the management. A ticket, price 10*s.*, admits to the classes of natural philosophy and chemistry, on each of which

there is an annual course of 25 lectures; and various other branches are taught. The value of their accumulated property in books (4,000 vols.), apparatus, and models, is estimated at 3,000; there is, besides, a building fund of 6304. In session 1839-40, 380 tickets were sold for the classes of chemistry and mechanics, and 434 for those of botany, physiology, music, and English literature. The class fees amounted in the same year to 1964; the annual subscriptions and donations to 1744. A scientific and literary reading-room is attached to the institution. Four similar institutions established in the suburbs, are all well attended.

The parliamentary returns show that, in 1831, when the pop., including some districts not reckoned in the city, amounted to near 214,000, there were 14 parochial schools with 25 masters, and 186 other schools with 202 masters. But these are exclusive of female schools, of children taught by domestic tutors, of numerous Sunday schools, and of the public institutions just described. Still, however, we incline to think that there are some omissions in the returns to parliament, inasmuch as the children at school in Glasgow is, according to them, nearly a third below the average of Scotland, the pupils not exceeding 74 per cent. of the whole pop. According to a return made to the General Assembly, in 1835, the children between 6 and 15 years of age unable to read, in five of the city parishes, including about a fourth part of the whole pop., amounted to 6,295. (*Report of the General Assembly's Education Committee, 1835, p. 28.*)

The High School deserves particular mention. It was formerly an exclusively classical seminary, with the exception of a writing class, having 5 teachers for Latin and Greek, with 1 for writing; the time devoted to classical literature being from 8 to 6 hours daily. But, in 1834, it was resolved to modify the course of instruction in the school, so as to make it more suitable to the wants of a great manufacturing and commercial city. In consequence, the classical department was limited to 2 teachers, and the time to 2 hours; and teachers of English literature, geography, mathematics, modern languages, and drawing were introduced. In 1836, a chemical class was established; and soon afterwards this department was made to embrace natural philosophy and natural history.

A normal school, or a school for instructing teachers in the art of tuition, was founded by the Glasgow Educational Committee in 1836, and was the first, and may, in fact, be still regarded as the only, seminary of the kind in Scotland. Its directors must, according to its constitution, belong to the national church; but there is no such exclusion in regard to those who are instructed in it. The fee is 3*l.* 3*s.* for the course of training, which may extend over a whole year.

Notwithstanding their devotion to commercial pursuits, the merchants of Glasgow have always been distinguished by their attention to and patronage of literature and science. The Literary and Commercial Society was established nearly a century ago, and can exhibit in the list of its members, at different times, the names of Dr. Francis Hutcheson, Adam Smith, Dr. Joseph Black, Mr. Millar, professor of law, and other distinguished individuals. It has, indeed, since its origin, been attended by the leading citizens of Glasgow, both literary and commercial. In the range of its discussions, it includes every subject except theology and party politics.

The Glasgow Philosophical Society, instituted in 1802, is also an important association. The Maitland Club, instituted in Glasgow in 1828, is similar to the Bannatyne Club of Edinburgh, and the Roxburgh Club of London, printing for the use of its members MSS. and rare works illustrative of the early history, manners, and literature of Scotland. It was originally limited to 50 members; but has been extended to 100. Glasgow has also two statistical societies, a geological society, and several others. In addition to these belonging to the university, to Anderson's institution, and to the mechanics' institution, there are numerous subscription and circulating libraries, of which the two most important are the Glasgow public library, and Stirling's, each containing upwards of 10,000 volumes. The first newspaper published in this city, the *Glasgow Courant*, made its appearance in 1715; since which time, attempts to establish it have been made, but at this moment (1840) only 10 survive; 2 published thrice a week, 5 twice a week, and 3 once a week.

Letterpress printing was not introduced into Glasgow till 1638, upwards of 100 years after it had been established in Edinburgh; nor did it flourish there for nearly a century after its introduction. But about the middle of last century the Messrs. Foulis raised the Glasgow press to the highest eminence, and their editions of some of the principal Greek and Latin classics are valuable alike for the beauty of their typography, and their accuracy. In the course of the present century Messrs. John & Andrew Duncan, printers to the university, have published some splendid editions of the classics, and of works con-

nected with classical literature. Glasgow is not, however, a literary mart; and its authors usually make arrangements with Edinburgh or London houses for printing and publishing their works.

The charitable institutions of the city are too numerous to be minutely specified. They comprise, amongst others, two lying-in hospitals and dispensaries, a cowpox institution, Magdalene asylum, deaf and dumb institution, blind asylum, eye infirmary, lunatic asylum, house of refuge, humane society, &c. In addition to Hutcheson's hospital, for the maintenance of decayed burghesses and their widows, and the education of boys, sons of burghesses, there are numerous free schools for the poor, and similar institutions. About 70,000*l.* are expended annually for religious, benevolent, and educational purposes, under the management of the magistrates and parochial clergy, part being the produce of funds bequeathed, and part the result of voluntary contributions. This is exclusive of Hutcheson's hospital, and three charity schools otherwise endowed.

A regular police establishment was first organised in this town by act of parliament in 1800. It is now a most efficient body, consisting of 8 heads of departments, 3 lieutenants, 10 officers, 135 night watchmen, 8 constables, 21 law officers, 60 drummers, and 200 menumories; in all, 318 persons. It is under the direction of the magistrates, the dean of guild, the convener of the trades' house, and one commissioner from each ward, chosen by the rate-payers; and is supported by a tax, averaging about 5 per cent. on the rental. The number of public executions, from 1756 to 1840, a period of 75 years, was 102, being, at an average, 1*l.* per annum. The gaol, though constructed in 1810, is deficient in accommodation; but the bridewell is admitted to be one of the most perfect establishments of the kind in the empire. Each prisoner is confined in a separate cell, and employed at his own business. Mr. Symons says that, in respect of cleanliness and economy, this institution leaves nothing to desire, and is a pattern for Europe. In 1837, the committals were 2,067, and the average period of confinement 63 days. Deducting the value of the prisoners' labour, it cost the public, during the above year, only 848*l.*

Trade and manufactures.—Glasgow owes its present greatness to its advantageous situation on a fine river, in one of the richest coal and mineral districts in the empire. Originally, however, the Clyde was much encumbered by fords and shallows, and for a lengthened period it served rather to excite and disappoint expectations, than to confer any real commercial advantages on the city. In 1662, after several other schemes had failed, the magistrates of Glasgow purchased the ground on which Port Glasgow (16 miles lower down the river) now stands, where they formed a harbour and a graving dock, the first work of its kind in Scotland. For a considerable period the intercourse between Glasgow and its newly acquired port was principally carried on by land carriage; but from 1665 attempts were every now and then made to deepen the river. In 1688 a quay was formed at the Broomielaw; but even so late as 1775 no vessel, drawing 6 ft. water, could reach Glasgow, except at spring tides. At length, however, a plan, proposed in 1769 by Mr. Golburn, engineer of Chester, for deepening the river to 7 ft. at neap tides, was adopted. He proceeded to accomplish his task, partly by the employment of dredging machines, and partly by constructing dams and jetties, so as to confine and strengthen the course of the river. These measures have since been continuously and energetically followed up, particularly of late years; and with such success, that vessels drawing 15 ft. water come up to the city at springs, and that there is usually a depth of 5 ft. water in the river at low neaps. There are still four dredging machines and two diving bells in constant employment. The river, for 7 m. below the city, is very much contracted, and forms nearly straight lines; the sloping banks, formed of whinstone, being constructed in imitation of a dike. The accommodation for shipping at the Broomielaw has been very greatly extended; but a measure is now before parliament for adding to it, by the construction of extensive docks, and other conveniences.

The influence of these improvements on the shipping and trade of Glasgow has been most striking. Dr. Cleland says that, "less than 50 years ago, a few gabbards, and these only 30 or 40 tons burden, came up to Glasgow; and I recollect the time when, for weeks together, not a vessel of any description was to be found in the port of Glasgow." (*Former and Present State of Glasgow, 80.*) Now, however, a greater number of sailing vessels and of steamers belong to Glasgow than to any other Scotch port; and the harbour is constantly crowded with ships from foreign parts, coasting vessels, and steamers. The steam-packets belonging to the Clyde that ply to Liverpool, Dublin, and Belfast, are amongst the finest vessels of their class in the empire. In all, there belonged to Glasgow in 1838, 53 steamers; of the aggregate burden of 6,944 tons. Subjoined is a—

Account of the Nett Amount of the Tonnage Dues on Shipping coming up to the Broomielaw at different periods since 1770:—

Years.	Revenue.	Years.	Revenue.
1770	149 10 6	1850	20,296 18 5
1780	1,515 8 4	1855	21,910 19 8
1790	2,270 0 4	1836	25,612 16 0

1819	- - - 8,402	1834	- - - 74,255	1858	- - - 394,145
1820	- - - 8,384	1835	- - - 70,564	1859	- - - 468,975
1821	- - - 11,030	1836	- - - 55,014		
1822	- - - 11,129	1837	- - - 72,051		

In 1811, the revenue of the Glasgow post-office amounted to £3,411; in 1810, it amounted to £7,598; in 1831, to £6,637; and in 1839, to £7,577.

Canals and Railroads.—In addition to river navigation, the city enjoys the advantage of several canals and railroads. Of the former, the Forth and Clyde, generally called the Great Canal, begun in 1768, but not completed till 1798, is by far the most important. It unites the two seas on the E. and W. of Scotland, extending from Grangemouth on the Frith of Forth, to Bowling Bay on the Clyde, a distance of 35 m., with a collateral cut of 2½ m. to Port Dundas, at the N. extremity of the city of Glasgow. Its medium width at the surface is 56 ft., at the bottom 27, and the depth of water 10 ft.; thus serving for the transit of vessels of upwards of 100 tons burden. The income of this canal, in 1836, was £3,743. 16s. 7d. The Union Canal from Edinburgh joins this canal 4 m. E. Grangemouth. The other canals are, the Monkland, length 12 m., which connects Glasgow with the coal and iron mines in the pars. of Old and New Monkland; and the Glasgow, Paisley, and Johnstone Canal. The depth of these canals is 6 ft. With regard to railways, the Monkland and Kirkcaldy Railway, length 9½ m., connects the two parishes in question with the Great Canal, and thereby with Glasgow. The Ballochney Railway is merely an extension of the one just named into the coal and ironstone districts. The Garnkirk and Glasgow Railway, length 8½ m., forms a communication between the city and valuable mines of coal and ironstone in the par. of Cadder. In addition to these lines, a railroad between Glasgow, Paisley, and Ayr, is (July, 1840) on the verge of being completed, that part of the line between Glasgow and Paisley being already in operation. In 1838, an act for a railway between Edinburgh and Glasgow, length 46 m. was obtained: the work was considerably advanced, and it is supposed will be completed in 1841.

Prior to 1300, Glasgow was merely a fishing village, that part of it lying on the river, now the Briggate, being called the Fisher-row. The business was long of a small scale, and limited to the home market; but, in 1460, the trade of fishing and curing salmon and herrings for the French market was introduced; a traffic that was carried on with varied success for about two centuries. Indeed this seems to have been the only important branch of business carried on here till 1638, when a person of the name of Fleymling, and partners, proposed to erect a weaving factory, provided the municipal authorities would grant them encouragement. On considering this offer, the town-council gave them a lease of suitable premises, for 17 years, free of rent; an act of liberality that ran great risk of being defeated by the opposition of the freemen weavers, who protested against the grant, on the ground that the factory would be injurious to their interests. In the end the company, to get rid of the opposition, agreed not to employ any weavers other than freemen. This was the origin of weaving factories in Glasgow. But nearly a century elapsed before the manufacture of lawns, cambrics, and such like fabrics, was introduced. These, however, were extensively pro-

The business connected with the port and the river is managed by parliamentary trustees. The gross revenue of the trust for the year ending the 31st of August 1839, amounted to 45,826. 13s. 6d.; and the expenditure, including interest of debt, to 35,694. 17s. 4d. The nett debt due by the trust amounted at the same period to 122,335. 2s. 3d. The port dues were raised in 1826 from 1s. to 1s. 4d. per ton. Perhaps, on the whole, it is to be regretted that, instead of attempting to improve the navigation of the Clyde, a ship-canal had not been constructed from Glasgow to the deep water in the river; but it is now too late to think of such a measure. Subjoined is an

Account of the Arrivals of Sailing and Steam Vessels at the Broomielaw during the Two Years ending the 31st of August, 1839.

deduced from about 1740, till the business was superseded by the introduction of the cotton manufacture. The situation of Glasgow as to trade, in 1661, may be accurately learned from the statement of Tucker, who had been commissioned by Cromwell's government to draw up a report on the revenue of customs and excise in Scotland. "With," he says, speaking of Glasgow, "the exception of the collectors, all the inhabitants are traders; some to Ireland, with small sundry goods, in open boats, from four to ten tons, from whence they bring hoops, rungs, barrel staves, meal, oats, and butter; some to France, with plaiding, coals, and herring, from which the return is salt, pepper, raisins, and prunes; some to Norway for timber. There hath likewise been some who ventured as far as Barbadoes, but the loss which they sustained by being obliged to come home late in the year, has made them discontinuous going thither any more. The mercantile genius of the people is strong. If they were not checked and kept under by the shallowness of their river every day more and more increasing and filling up, so that no vessel of any burthen can come up nearer the town than 14 m., where they must unlade, and send up their timber on rafts, and all other commodities by 3 or 4 tons of goods at a time, in small cobbles, or boats, of 3, 4, or 5, and none above 6 tons a boat. There is in this place a collector, a chequer, and four waiters. There are 12 vessels belonging to the merchants of this port, viz. 3 of 150 tons each, 1 of 140, 2 of 100, 1 of 50, 3 of 30, 1 of 15, and 1 of 12, none of which come up to the town. Total, 967 tons."

A company for carrying on the whale fishery and making soap was formed in 1674. They employed five ships, and had extensive premises at Greenock for boiling blubber and curing fish. The whale fishery has long been given up; but the soap manufacture has ever since been extensively carried on. This is evinced by the fact that the quantity of soap made in Glasgow in 1839 amounted to 5,858,844 lbs. of hard, and 2,519,130 lbs. of soft soap, being more than half the quantity of soap made during the same year in Scotland. The manufacture of ropes was commenced in 1696; and two years afterwards an act of parliament was obtained in favour of this business, imposing a duty on all ropes imported from the Sound or E. seas; and in return, the company were to advance a capital of 40,000. Scots, and to bring in foreigners to the work. The manufacture of ropes and cordage is now also an extensive branch of industry, in which large capitals are invested. The tanning of leather and the brewing business were introduced previously to the Union (1707), and have ever since, particularly the latter, been important branches of manufacture. Almost the whole of the Scotch ale imported into our colonies is produced at Glasgow.

But it was not till after the Union, in 1707, when the trade to the American and West Indian colonies was, for the first time, opened to the enterprise and activity of the Scotch, that the commercial energies of Glasgow began to be fully developed. Her merchants immediately embarked in the trade to the W. Indies and America, especially in that to Maryland and Virginia; and such was the success that attended their efforts in this new department, that in a few years Glasgow became the grand entrepôt through which the farmers general of France principally received their supplies of tobacco. But for a considerable time they carried on their colonial trade in vessels chartered from English ports; and it was not till 1718, that a ship, built in the Clyde, the property of Glasgow merchants, crossed the Atlantic! To such an extent was this branch of commerce carried on, that, for several years prior to 1770, the annual import of tobacco into the City amounted from 35,000 to 45,000 hogheads. In 1771, the quantity was 49,016 hogheads; and in 1775, 57,142. The American war put an end to a traffic from which Glasgow

had reaped great advantages. But no sooner had this business been cut off than the merchants directed their energies to other channels; and found in the extension of the W. India trade, and still more in the introduction of the cotton manufacture, new and far more productive sources of employment and wealth. The wonderful inventions and discoveries of Hargreaves, Arkwright, and Watt, powerfully attracted the attention of the more enterprising and intelligent citizens of Glasgow; and in a few years the cotton manufacture was introduced and established. The manufacture of linens, lawns, cambrics, &c., having been already extensively carried on, the work-people had little difficulty in applying themselves to the new business; at the same time that the favourable situation of the city for trade, and its unlimited command of coal and iron ore, gave it every facility for successfully prosecuting the manufacture. Hence it is that for a lengthened period Glasgow has been second only to Manchester in this great department of industry. Her cotton mills are on the largest scale, her machinery is of the most perfect description, and in the fineness of her muslins and other fabrics, she is, perhaps, unrivalled. The following table shows the number of cotton and other factories in Glasgow and its immediate suburbs, in 1832-39; and of the hands employed. (*Parliamentary Report relating to Mills and Factories, 1839, p. 265*.)

Species of Manufactures.	No. of Mills.	Persons under 21 Years of Age.		Persons above 21 Years of Age.		Total of both Sexes.
		Males.	Females.	Males.	Females.	
Cotton	101	2,444	8,180	2,418	4,178	17,620
Woolen	5	111	228	199	46	575
Flax	2	28	151	45	47	254
Silk	5	67	230	43	70	410
Totals	109	2,650	8,775	3,095	4,511	18,859

There belonged to Glasgow, in 1834, no fewer than 32,000 hand-loom; viz., 18,537 in the city and suburbs, and 13,463 in other towns, employed on account of Glasgow manufactures. (*New Statist. Acc. of Scot., & Glasgow, p. 154.*) And the number is supposed rather to have increased in the interval. The hand-loom weavers at a distance receive the average rate of wages, but have the expense of carriage to defray both from and to Glasgow. Not only, however, is Glasgow the great centre of the cotton manufacture, but it is the centre of the woolen trade, with a radius of 10 m. be drawn around Glasgow, it will embrace 66 additional mills, comprising, in fact, the whole cotton mills of Scotland except 28, scattered over 8 different counties. The Glasgow mills are all moved by steam power. The above estimates are exclusive of vast numbers of persons employed in tannery, bleaching, dyeing, printing, &c. Glasgow is especially famous for its success in dyeing cottons red; in this respect it is superior to any other manufacturing town in Britain, though still inferior to several of those on the Continent. (For some information with respect to the quantity of cotton spun in Scotland, and the value of the manufacture, see *anté*, p. 772.)

Glasgow is also becoming, or rather, has already become, the centre of a most extensive iron trade. In fact, the production of iron in the neighbourhood of this city already exceeds that of either Monmouthshire or Glamorganshire, and promises very speedily to be equal, or superior, to that of the whole of S. Wales. It has increased with unparalleled rapidity. In 1806, the produce of iron in this county did not exceed 9,000 tons; in 1834, it was estimated at about 48,000 tons; and we have ascertained, from returns drawn up with the greatest care, that, in June, 1840, there were at work in Lanarkshire 60 furnaces, producing at the rate of about 210,000 tons a year! and several additional furnaces were then, also, in the course of being constructed.

There are in Glasgow five joint-stock banking companies belonging to the city, some of which have very considerable bodies of proprietors. But a large portion of the banking business is transacted by the branches of the Royal Bank, the British Luen Company, &c., established here. There is also a provident and a savings' bank. The latter held on the 20th of Nov., 1839, deposits to the amount of 123,201*l.*, contributed by 9,394 depositors.

The chemical works at St. Rollox (Charles Tennant and Co.), for the manufacture of sulphuric acid, chloride of lime, soda, and soap, extend over 10 acres of ground, and contain upwards of 100 furnaces, retorts, or fireplaces. Distilleries, potteries, sugar-refining, and many minor branches of industry are successfully prosecuted. We mention, that the curing of rounds of beef is carried on to a great extent in Glasgow. Dr. Cleland mentions, that in 1839 no fewer than 14,491 rounds of beef were sent from Edinburgh to Glasgow to be cured! The quantity of coal, from the collieries in the neighbourhood, brought to Glasgow in 1831, amounted, according to Dr. Cleland, to 561,049 tons, of which 124,000 were exported. The quantity brought to Glasgow is now estimated at 750,000 tons.

Ship-building, except in respect to steam-boats, can scarcely be said to exist in Glasgow, being chiefly confined to Bowling Bay, Port Glasgow, and Greenock. But Glasgow, and the Clyde generally, are more celebrated for the manufacture of steam machinery than perhaps any other place in the empire; and have supplied machinery to some of the largest and finest vessels belonging to foreign powers, as well as to Great Britain.

Progress of Population.—According to the best attainable information, the pop. of Glasgow, at different periods down to 1831, has been as follows:—

Years.	Inhabitants.	Years.	Inhabitants.
1560	4,500	1780	42,832
1610	7,644	1791	66,578
1660	14,678	1801	77,365
1708	19,766	1811	100,749
1740	17,034	1821	147,043
1763	28,300	1831	326,166

This is an extraordinary increase. During the interval between 1801 and 1831, the pop. of Manchester, which has increased faster than any other English town, rose 251 per cent.; but it results from the above statement, that the increase of the pop. of Glasgow during the same period is no less than 261 per cent. — a progress wholly unexampled in any old settled country, and almost equal to any thing that has taken place in the U. States. At this moment (1840) the pop. is probably about 325,000.

State of the Poor, &c.—The increase of pop. has, of course, been mainly occasioned by the still more rapid increase of wealth and employment. It has not, however, we regret to say, depended wholly on this; and there can be no doubt that the increase of pop. has in some degree exceeded the increased demand for labour, vast as that increase has been. This has been principally a consequence of the prodigious influx of labourers from Ireland. When the last census was taken, in 1834, it was found that no fewer than 35,544 natives of Ireland were domiciled in Glasgow; and agrest the number is probably about 60,000! It is not easy to exaggerate the mischievous influence of this immigration. There are but few instances in which the Irish have been improved by the change; but they have had, partly by the effect of their competition in reducing wages, and partly and principally by their habituating the Scotch, through their example, to become contented with a lower standard of comfort, the most pernicious influence over the condition of the Scotch part of the labouring pop. At the same time, too, that this pauper horde has been pouring into the city, the weavers, who form a large portion of the pop., have had to bear up against the competition of the power-loom. In fact, but for the reduction of wages occasioned by the Irish immigration, it is probable that the race of hand-loom weavers in Glasgow would have been nearly extinct. And when we consider the fluctuations to which this business is exposed, the facility with which it is learned, and the comparatively low wages which those engaged in it have always earned, no one could regret its annihilation. But the Scotch family has withdrawn from the business, its place has been supplied by an Irish one; and the extension of power-loom has been checked by the extreme lowness of the wages paid to the hand-loom weavers.

In consequence of this depressed state of the weaver pop., of the fluctuations incident to manufacturing employment, and of the crowded, filthy, and miserable lodgings occupied by the pauper portion of the pop., Glasgow is frequently visited by the most destructive fevers, and the rate of mortality has of late years been very high. This will be evident from the following statement, compiled under the direction of the city authorities, which exhibits the pop., and the rate of mortality, during each of the 17 years ending with 1838. We have added the price of bread per cwt. for several of these years.

TABLE, showing the Rate of Mortality in Glasgow for the 17 Years ending with 1838, and the Price of Bread per cwt. from 1828 to 1837 inclusive:—

Years.	Population.	Deaths.	Rate of Mortality.	Price of Bread per cwt.
1822	151,540	2,408	1 in 44,436	
1823	166,170	4,286	1 — 36,437	
1824	161,180	4,354	1 — 37,035	
1825	166,260	5,271	1 — 31,534	
1826	171,690	4,220	1 — 40,677	
1827	177,380	4,787	1 — 37,038	
1828	181,160	5,534	1 — 32,565	15s. 0d.
1829	189,470	4,991	1 — 37,992	12 0
1830	196,650	4,714	1 — 41,504	12 8
1831	202,482	5,981	1 — 33,645	12 8
1832	209,290	6,634	1 — 31,532	12 0
1833	216,440	6,050	1 — 35,776	11 6
1834	229,940	6,167	1 — 36,912	10 5
1835	235,000	7,158	1 — 32,647	12 0
1836	244,000	14,411	1 — 16,936	12 0
1837	255,000	10,970	1 — 23,324	13 0
1838	265,000	6,822	1 — 37,959	

* Price paid by governor of Bridewell.

The mortality in Glasgow in 1832, as exhibited in the above table, is most appalling, and certainly exceeds what has ever been experienced in any other large town in the empire. Its excessive amount is in part, however, accounted for by the prevalence of cholera in that year; but the mortality in 1830 and 1837, especially the latter, when there was no cholera, is also tremendously great; and exhibits, to use the words of Dr. Cowan, "an intensity of misery and suffering unequalled in Britain, and not surpassed in any city of the Continent." (*Vital Statistics of Glasgow*.) Typhus fever had prevailed in Glasgow for two years previously to 1837; but its ravages were confined within comparatively narrow limits till the stagnation of trade, and the consequent want of employment, gave them a frightful extension. In 1836, the fever cases were reckoned at 10,092; whereas, in 1837, they rose to 21,800, of which no fewer than 2,180 were fatal! Dr. Cowan states, that the increased mortality in 1837 was chiefly confined to the adult pop.

This state of things calls for the immediate attention, not only of the authorities in Glasgow, but also of the government. We believe that here, as in Edinburgh (which see), the provision for the support of the poor is most inadequate. The keeping of the assessment as low as possible, is not the only, nor even the principal, object to be attended to. In periods when employment is deficient, the poor should be sustained; for if they be not, the chances are, that outrages will take place; and supposing these not to occur, the destitution in which the poor are involved is sure to generate diseases which spread terror and death through every class of the pop. But preventive no less than remedial measures are required. Much might certainly be done by improving those parts of the city already alluded to, which are at once the receptacles of the lowest and most destitute portion of the pop., and the seats of disease and pestilence. And it deserves consideration whether some restrictions should not be laid on the settlement of Irish labourers. It is usual to ascribe much of the want and suffering of the poor of Glasgow, as of other great towns, to the prevalence of drunkenness; but it might easily be shown that drinking, instead of increasing, has considerably diminished. No doubt it is still much too general; and probably an increase of the license duty, by lessening the number of houses for the sale of spirits, and the temptation to engage in the spirit trade, might have a good effect.

Parliamentary Representation.—Previously to the Reform Act, the representation of Glasgow was in the worst possible state. This great city had not even a representative of its own, but was united with the insignificant bors of Rutherglen, Renfrew, and Dumbarton, in sending a mem. to the H. of C. the vote of each of these bors, having equal weight with that of Glasgow! The Reform Act made an end of this preposterous arrangement, and conferred on Glasgow the privilege of sending 2 mems. to the H. of C. The par. bor. includes Gorbals, Calton, Bridgeton, Anderston, Camlachie, part of Port Dundas, &c.; and had, in 1840, 7,620 registered electors. The government of the city is vested in a provost, 5 bailies, and 23 counsellors. Corporation revenue, in 1838-39, 15,457*l*. 12*s*. 10*d*.

With regard to the history of Glasgow, little need be added to what has already been incidentally said. So insignificant at first was this great city, that it was included in the privileged boundaries of Rutherglen, which was made a royal bor. in 1202. Nor was it till 1611 that a similar privilege was conferred on Glasgow; though it had long enjoyed the rank and importance of a bor. of barony, originally bestowed on it by Bishop Joceline about the year 1172. The see was made archiepiscopal towards the end of the 15th century. From the time of Achais, the restorer of the bishopric, till the Reformation, Glasgow was governed by 26 bishops and 4 archbishops; and between the Reformation and the final establishment of Presbytery, in 1790, by 14 Protestant archbishops. The town was, in former times, frequently visited by the plague. Leprosy also prevailed; there was a leper hospital in the Gorbals. The famous General Assembly of the Kirk of Scotland, which, in 1638, displaced Episcopacy, deposed and excommunicated the bishops, and established Presbytery, was held in Glasgow. On the occasion of the Union, in 1707, the citizens manifested great discontent, and could with difficulty be restrained from outrage; but that event, by opening new sources of trade, eventually proved of the most signal advantage to their city. They raised 2 battalions of 600 men in defence of government, in 1745, but the city was, notwithstanding, taken by the pretender, and had to submit to heavy exactions. At the commencement of the American war, in 1775, the citizens of Glasgow raised, at their own expense, a regiment of 1,000 men; and during the revolutionary war with France, they kept on foot several regiments of volunteers. In more recent times the contests between masters and their workmen, resulting, on the part of the latter, in strikes and combina-

tions for an advance of wages, have been pretty frequent. In some instances, these strikes have been supported with great obduracy; and, on a recent occasion, they were productive of fatal results, and were found to involve principles of the most pernicious and destructive tendency. (In addition to the works already quoted, see *Keith's Catalogue of Scotch Bishops*, & *Glasgow's Forsyth's Beauties of Scotland*; *The Histories of Glasgow*, by *McUre, Gibson, and Cleland*; *Boundary Reports*, &c.)

GLASGOW (PORT). See PORT GLASGOW.

GLASTONBURY, a bor., town, and par. of England, co. Somerset, hund. Glaston-twelve-hides, on the Brue, 22 m. S.W. Bath, and 112 m. W. by S. London. Area of the two pars. which comprise the bor., (including not only the town, but the hamlets of Northover, Edgarley, Norwood-park, and Wick,) 7,980 acres. Pop. of do. (1851), 2,984. The town is situated in the valley which separates the Poldew and Mendip Hills, and stands chiefly on a low peninsula (once the Isle of Avalon) formed by the turnings of the river: it consists of two streets, the chief of which runs from E. to W., the other from N. to S., forming the road to Bridgewater and Exeter; and in both of these streets the fronts and other parts of many houses are composed of stone from the ruins of the abbey. Of these the most remarkable are the George Inn, a curious building probably of the 13th century, given by Abbot Selwood in 1490 to the chamberlain of the abbey; the Tribunal, having a fine oriel window adorned with the arms of abbots and other benefactors; the Abbey-house, built in 1714 from the materials of the abbots' lodgings; and the great Gate-house, now one of the inns of the town. The hospital of St. John, on the Bridgewater road, was founded in 1246. The cross, now a mere ruin, stands at the intersection of the chief streets. Of the two parish churches, which are both old, that of St. John the Baptist is remarkable for a fine lofty tower, which forms the most ornamental feature of the place. The abbey belonging to the Benedictines, situated on the S. side of High Street, was surrounded with a high wall, containing about 50 acres, which, however, is now scarcely traceable. The great church joined the W. front, and was 530 ft. long; and in other parts were various lodgings for the abbot, prior, and other inmates of the abbey: the great hall was 111 ft. long by 50 ft. broad. The ruins of the church are extensive, and serve to give an idea of its size. The abbots' kitchen, which is in better preservation than any other part, is octagonal, and in the roof rises an octangular turret crowned with a lantern. This abbey, founded by Augustine of Canterbury in 635, was re-modelled and chiefly built during the 12th century, the hall and chapter-house being added in the 14th century. At the dissolution of the monasteries in 1539, the last abbot being unwilling to surrender his abbey, was hanged without trial, and the site was granted by Edward VI. to the Duke of Somerset. At this time the revenues were valued at 3,311*l*. On a hill a little N.E. of the town, is a curious tower, called the Tor of St. Michael, which, from its elevation and peculiar shape, serves as a landmark in navigating the Bristol Channel. On the W. side is a figure of St. Michael the archangel.

The town has but little trade, but "it is likely to derive considerable benefit from a canal opened some years ago between this place and the mouth of the river Brue, near Highbridge, the point where the Brue runs into the Parrot; it is intended to be a ship canal for vessels of 70 to 100 tons. Timber, slate, tiles, and coal are the principal articles at present conveyed upon it." (*Mess. Corp. Rep. No. 1*.) The bor. (which before the Municipal Reform Act was governed by a mayor, recorder, and 23 burgesses, according to a charter granted 4th of Queen Anne) is now governed by a mayor, 4 aldermen, and 12 counsellors. The mayor was formerly a magistrate within the bor., and presided at quarter sessions; but, in consequence of the removal of the police business to Wells, the commission of peace has been taken from Glastonbury. The local act of H. Geo. III. is that by which the paving and improvement of the town is regulated. The rates levied under this act amount to about 240*l*. per annum. The poor-rates average 1,800*l*. a year, and the contribution to county rate about 240*l*. Market on Tuesday, Fairs, Sept. 10. and Oct. 11., the former being for horses and cattle.

The history of the town is intimately connected with that of the abbey, on which its prosperity has mainly depended. It was burnt down in the 12th century, with part of the abbey; and, after having been rebuilt by Henry III., was once more destroyed by (as is said) an earthquake, after which it was gradually restored, chiefly by the help of the abbey. The abbots of Glastonbury lived in great splendour, and possessed great political power: they were always parliamentary barons, and, till 1164, had precedence of all other mitred abbots in England. Sharpsham Park, in the vicinage of this town, was formerly a manor-house belonging to the abbots of Glastonbury. Before the Reformation, Glastonbury was a par. bor., and sent 2 mem. to the H. of C.

GLATZ (Slav. *Kladsko*), a fortified town of Prussian Silesia, gov. Breslau, cap. circ. of same name, on the Neisse, near the Austrian frontier, 52 m. S.S.W. Breslau. Pop. 7,004; or about 9,000, including its garrison. It is strongly walled, and being situated between two adjacent heights, is farther defended by an old castle placed on one, and a new and regular fortress on the other. It has 4 R. Catholic, and 2 Lutheran churches, an hospital, Catholic gymnasium, royal arsenal, arsenal, large barracks, and other buildings for military service. It is the residence of a military commandant, and the seat of the council and courts of justice for the circ. and town, and commissions for the superintendence of public works and navigation. It has manufactures of woollen cloth, damasks, plush, ribbands, muslins, leather, and tobacco, and some linen-printing establishments. Glatz surrendered to Frederick the Great in 1743; it was retaken by the Austrians in 1759, but restored to Prussia at the peace of 1763. (*Berghaus*; *Siles*; *Diet. Geogr.*)

GLOGAU (GREAT), a strongly fortified town of the Prussian dominions, prov. Silesia, gov. Liegnitz, cap. circ. of same name; on the Oder, 33 m. N. Liegnitz, and 83 m. S.E. Frankfort-on-the-Oder. Lat. 51° 38' N.; long. 16° 6' 45" E. Pop. 11,646, of whom about 1-10th are Jews. The town is connected by a wooden bridge with the Dominsel (Cathedral-island) in the Oder, which is also fortified. Besides the cathedral it has several other Roman Catholic and Protestant churches, and a synagogue. It has a royal citadel, and a large garrison. Glogau is the seat of the superior judicial court for Lower Silesia, of tribunals for the circle and town, a board of taxation, circle council, board of agriculture, &c.; it has a Catholic and a Protestant gymnasium, and a school of midwifery. Except a large beet-root sugar establishment, it has few manufactures; its inhabitants derive their principal resources from the supply of the garrison, general trade, and the navigation of the Oder. Glogau has a large corn-market. It came into the possession of Prussia in 1741. (*Berghaus*; *Cannabich*, &c.)

GLOUCESTER, a marit. co. of England, on both sides the Severn, having S. the channel of that river, the co. Somerset, from which it is principally separated by the Avon, and Wilts; E. a point of Berks. and Oxford; N. Warwick and Worcester; and W. Hereford and Monmouth. Area, 808,120 acres, of which about 750,000 are arable, meadow, and pasture. It is naturally divided into the Vale, Cotswold, and Forest districts. The vale which comprises the low lands from Stratford-on-Avon to Bristol, is commonly divided into the vales of Gloucester, Evesham, and Herekley; the Cotswold district comprises the hilly country parallel to the Severn from Chipping Camden to Bath, dividing the sources of the Isis, Winrush, Coln, Churn, and other remote feeders of the Thames from the Stroud and other streams flowing W. The forest district includes the greater portion of the land on the W. side the Severn, and was formerly for the most part included within the Forest of Dean, whence its name. The Vale of Gloucester, taking its term in its widest sense, is one of the most fertile districts in the kingdom; the soil consists in part of a sandy loam, and in part of a reddish clay; and the climate is remarkable for its mildness. The soil of the other two districts is, for the most part, light and comparatively poor. Agriculture is not in an advanced state; there is a great waste of labour in ploughing, and a great want of an effective system of drainage. There are some exceedingly productive meadows, especially along the banks of the Severn below Gloucester. This co. has been long famous for its dairies, and for the peculiar description of cheese that bears its name. The average yield of a cow in the dairies is estimated at from 3½ to 4½ cwt. of cheese a year. The sheep of the Cotswold hills are large, and yield long combing wool: the total stock of sheep in the co. is estimated at from 550,000 to 600,000 head. This is one of the principal cider cos. Estates and farms of all sizes. Average rent of land, in 1810, 25s. an acre. Gloucester is not only a great agricultural, but also a great manufacturing co. It is especially famous for its manufacture of fine broad cloths. At an average of the 10 years ending with 1837, there were annually produced in Gloucestershire 1,784,928 yds. of cloth, the trade having been during that period pretty stationary. (*Handloom Report*, p. 365.) The principal clothing districts are Stroud, Wooton, and Dursley. Iron ore is abundant in the Forest of Dean; but notwithstanding it is also well supplied with coal, the iron-works carried on in it are of comparatively little importance. Principal river the Severn, which intersects the co.; the Wyre divides it from Monmouth, and the Upper Avon skirts it on the N., and the lower Avon on the S.: the Isis, as already stated has its sources in the Cotswold hills. (For an account of the Gloucester canal and railway, see following art.) Principal cities and towns, Bristol, Bath, Gloucester, Cheltenham, Stroud, &c. Gloucestershire is divided into 26 hundreds, and 339 parss.: it returns 15 mems.

to the H. of C., viz. 4 for the co., 2 each for the cities of Bristol and Gloucester, and the bors. of Cirencester, Stroud, and Tewkesbury; and 1 for Cheltenham. Registered electors for the co., in 1838-39, 14,687, being 7,683 for the E., and 7,004 for the W. division. In 1831 the co. had 71,254 inhab. houses; 83,446 families, and 387,019 inhab., of whom 188,118 were males, and 201,901 females. Sum paid for the relief of the poor, in 1838-39, 118,610s. Annual value of real property, in 1815, 1,315,782s.; profits of trades and professions in ditto, 367,242s.

GLOUCESTER, a city, co., parl. bor., and river-port of England, on the E. bank of the Severn, locally situated in the above co., hund. of Dudstone and King's Barton, 32 m. N. by E. Bristol, and 53 m. W. by N. London. Area of city, 680 acres; but the new municipal and parl. bor. includes about 170 acres more. Pop. of city in 1831, 11,533; estimated pop. of the new bor. in 1831, 13,000; the suburbs, also, are extensive, and make an addition of at least 2,000 to the pop. In the bor. are comprised nine entire parishes, and portions of six others. The city is situated on a slight eminence, gently falling on the N. and S., and towards the river; it consists of four principal streets, crossing each other at right angles. "It possesses some good streets, and has a general appearance of wealth and business." (*Mss. Bound. Rep.*) The same report informs us that "it is ill paved, and only partially and imperfectly lighted with gas." The river, which is here divided into two channels by Alney Island, and crossed at the N.W. end of the city, by two fine bridges, one over each channel. There are several handsome public buildings, among which, besides the cathedral, the shire-hall, the tolsey or town-hall, the co. goal, and market-house, deserve notice. The shire-hall, in which the assizes and county sessions are held, has a fine front of Ionic architecture, and is well constructed for the purposes of business. The county gaol, built in 1791, at an expense of 35,000s., on the site of the old castle, covers about three acres; it was constructed on a plan suggested by Howard; includes a bridewell and debtors' prison; and has sufficient means for the classification of prisoners. The city gaol has long been inadequate for the proper accommodation of its inmates, and the wants of the town, and a new one is about to be erected. (*Prisons' Report*) The market-house, which is commodious, and of plain exterior, cost 10,000s. A spa having been discovered in 1814, a highly ornamental pump-room and other edifices have been built near it. Several of the churches are old and handsome structures; the chief of these is the cathedral or abbey church, occupying one side of College Green, a building 420 ft. long, by 144 broad. On its site was formerly a monastery of Benedictines: the present building was partly erected about 1088; but not completed till the close of the 15th century. Hence it exhibits the various gradations of style during the great era of church architecture, from the Norman conquest downwards. The crypt, the nave, and north aisle being the oldest parts, are in the Anglo-Norman style, with round-arched windows; the windows of the plan suggest, built two centuries later, are of the obtuse lancet shape the W. front, and the continuation of the nave, erected in the 14th century, exhibit a yet later and more elaborate style than the other parts. Under the tower (which is square, flanked with four highly ornamented pinnacles, and 224 ft. high), at the E. end of the nave, is the approach to the choir; and from this point is one of the best views of the interior, the highly finished choir, with its curiously wrought roof, forming a remarkable contrast with the simpler architecture of the nave and transept. The arched of the choir, nave, and transepts is so contrived that, while the eye beholds the massive pillars as they branch upwards, the whole structure has an extraordinary lightness and beauty. The high altar is ornamented with angels playing on musical instruments, and behind it is the great E. window, said to be the largest in England, and containing 2,800 square feet of glass. It was set up in the reign of Edw. III., and is now much mutilated. The floor in front of the altar is of curiously painted tiles, representing the arms of the Plantagenets, the Earls of Gloucester, &c. A monument of Edw. III., near the altar, is well carved, and in good preservation. The choir is 140 ft. long, and has 31 stalls on either side, of exquisitely wrought tabernacle work. The lady chapel, added to the choir in 1228, and rebuilt in 1498, is a peculiarly elegant structure, and most ingeniously united to the church. The cloisters are remarkable for their rich workmanship and beautiful windows; they were begun in 1381, and finished about 1390. (*See Dallaway's Anecd. of Arch.*, pp. 38-55.)

Gloucester was made a bishop's see by Henry VIII. in 1541. In consequence of the recent ecclesiastical changes, it is united with Bristol. The churches of St. Mary de Crypt, St. Michael, St. John, and the new one of Christchurch, are all edifices ornamental to the town. There are also 2 very neat district churches newly completed in the suburbs, one at Barton Terrace, and the

other at High Orchard, near the Docks. The Wesleyans, Independents, Baptists, R. Catholics and others, have also places of worship, and there is a Jews' synagogue. Here are three foundation schools: 1. the college school, founded by Henry VIII., and held in the N. transept of the cathedral; 2. the script school, founded by Dame Cook, and sending two exhibitors to Pembroke Coll., Oxford; 3. the blue-coat school, founded in 1666, which has or had a master with a salary of 400*l.* per annum, teaching and apprenticing 20 boys (See *Carlyle's Grammar Schools*.) Besides these, a Lancastrian school and a Bell's school were established in 1813 and 1817 respectively; and a British school in the course of being established. It deserves also to be mentioned, that Sunday schools originated in this city in 1781. They were first suggested and set on foot by Mr. Raikes, a printer, a benevolent and intelligent individual, who rendered by this act an essential service to humanity. Here are 4 hospitals, of ancient monastic foundation, used as almshouses; besides which, there is an infirmary and a lunatic asylum.

The trade and prospects of Gloucester are flourishing. It is situated in a fertile and populous district, and enjoys an extensive command of internal navigation. It is, also, its importance as a port has been much increased, owing to the greater facilities given to it by the excavation of the Gloucester and Berkeley canal, by which the intricate and, sometimes, dangerous navigation of the Severn is avoided. This canal, opened in 1826, is 18 m. long; it commences at Sharpness Point, about 24 m. from Berkeley, and ends in a commodious basin, a little S. of Gloucester; it is 60 ft. wide, and being 18 ft. deep, is capable of floating vessels of above 800 tons burden. The shareholders, finding their subscribed capital insufficient, applied to government for a loan, with the interest of which they are still burdened. Gloucester, since the opening of this canal, has had considerable trade with the West Indies and Brazil. There belonged to the port in January 1839 259 vessels of the burden of 14,552 tons. The receipts of the canal company, in 1839, amounted to 17,720*l.*, and the customs' duties received at the port, in 1839, to 163,477*l.* The railway, nearly finished (1840), between this place and Birmingham has a subscribed capital of 950,000*l.* It is about 50 m. in length, and is a very important line, from its being the direct and only means of communication between the N. and W. of England, and from its passing through or near several important manufacturing towns. A short railway between this town and Cheltenham has been open for some years. The manufactures of Gloucester are but inconsiderable. Pin-making, which originated in 1825, used to employ 1,500 hands; but it has of late years materially declined. A bell-foundry has been established here for about a century and a half; and its business used to be considerable.

Gloucester has returned 2 mem. to the H. of C. since the 23d of Edward I. Previously to the passing of the Reform Act, the franchise was vested in the freemen of the bor., who became so by birth, purchase, or apprenticeship. Registered electors, in 1838-39, 1,674.

Gloucester possesses numerous charters of early date; but that by which it was formerly governed, and on which its privileges are founded, was granted in 1073 by Charles II., who received from the city 679*l.* in return. The local acts, by which the lighting and improvement of the city are regulated, are the 4th, 17th, and 21st of Geo. III., and the 1st and 2d of Geo. IV. By the provisions of the Municipal Corporation Act, the bor. is divided into three wards, and is governed by a mayor, recorder, 6 aldermen, and 18 councillors. The corporation rev. amounted to 10,708*l.* in 1839; but that sum includes a sale of property amounting to 4,448*l.* The poor-rates of the bor. were estimated at 4,862*l.* in 1831; the rack-rents at the same time being valued at 46,217*l.* The custom of borough-English, whereby estates descend to the youngest son, prevails here. A co. court is held once a month, and there is a court of requests for the recovery of debts under 40*l.* Markets, which are well supplied, are held on Wednesday and Saturday. Fairs for cheese, cattle, horses, &c. are held on April 5, July 5, Sept. 30, and Nov. 30.

The history of Gloucester carries us back to the time of the Romans. It is mentioned in Antonine's *Itinerary* as *Colonia Glouernia*, and was founded by Claudius, A.D. 44, to repel the wild Celts of S. Wales. Roman coins and antiquities are constantly dug up near the supposed site of the old encampment. In Anglo-Saxon times it surrendered to the king of Wessex in 877, being then called *Gloucestre*. In the war between Robert and William, the sons of the Norman conqueror, it was nearly destroyed, and was rebuilt, when the present cathedral was commenced. In the wars between Charles I. and his parliament the inhab. sided zealously with the latter; and hence, at the Restoration, the city fortifications were ordered to be destroyed. The gates continued to stand for many years subsequently; but even of these only the name remains.

GLUCKSTADT, a town of the Danish dom., duchy

GODALMING.

of Holstein, of which it is the cap., in a marshy tract on the left bank of the Elbe, about 30 m. from its mouth, and 264 m. N.W. Altona. Pop. (1835) 6,000. It was formerly a fortress of some strength; but, since 1814, its works have been nearly demolished. It is regularly built, has a good harbour, and a large prison. It is traversed by several canals, but has a very deficient supply of good drinkable water, on which account the rain has to be carefully preserved in cisterns. It is the seat of the council, and of the superior judicial courts of the prov.; and has a school of navigation, and various other schools. Since 1830, Gluckstadt has been a free port. Its inhab. are principally engaged in trade, navigation, and the Greenland whale fishery. (*Berghaus; Stein, &c.*)

GOA, a city of Hindostan, and the cap. of the Portuguese dominions in the East, prov. Bejaopor, on aul. of the same name, at the mouth of the Mandona, 250 m. S.S.E. Bombay; lat. 15° 30' N., long. 74° 2' E. Pop. reduced to about 4,000, it having been nearly superseded by New Goa or Panjim, built on the sea-shore about 5 m. distant, which has a pop. of about 20,000. "The old city, now almost deserted except by priests, is 'a city of churches; and the wealth of provinces seems to have been expended in their erection.' The ancient specimens of architecture at this place far excel any thing that has been attempted in modern times in any other part of the East, both in grandeur and taste. The chapel of the palace is built after the plan of St. Peter's at Rome, of which it is said to be an accurate copy. The church of St. Dominick is decorated with paintings of Italian masters; and that of the Jesuits contains the tomb of St. Francis Xavier, a sepulchre of black marble, richly sculptured in bas-relief, representing various passages of his life. The cathedral is worthy of one of the principal cities of Europe; and the Augustine church and convent is also a noble pile of building. Most of the churches are, however, going rapidly to ruin, and the ancient palace of the viceroys has been long unoccupied; the building formerly occupied by the inquisition, though entire, has been shut up for many years. (*Buchanan's Christian Researches*, &c. p. 245.)

New Goa, founded early in the 18th century, and now the residence of the viceroy and the principal Portuguese inhab., is a well-built town, the houses being of stone, and roofed with tiles, a circumstance unusual in Hindostan. Thin layers of oyster shell generally supply the place of glass in the windows. A fine causeway, 3 m. in length, connects the town with San Pedro (the present residence of the archbishop of Goa), and serves to shut out the sea from an extensive tract, partly in cultivation, and partly occupied by salt-pits.

New Goa has a harbour, reckoned one of the best in India, but, during the rainy season, so much mud is brought into it by the river, that ships of large burden find it difficult to enter. Like another harbour on the S. side of Goa island, it is defended by several forts and batteries; both the towns are also fortified, but not strongly.

The inhab. of Goa are principally the mixed descendants of the Portuguese and the natives, and African slaves; there are some Jews; native Portuguese are few. The wholesale trade is in the hands of the Christian pop., the retail in those of the Jews and Hindoo natives. Though formerly the centre of eastern commerce, Goa has now only an inconsiderable trade with the mother country and the Portuguese settlements in China and on the coast of Africa. Its imports are chiefly piece-goods, raw silk, ivory, sugar, woolens, glass, and a few other European articles. Its exports are trifling, and are chiefly hemp, betel nut, cowries, and toys, beads, &c. for Africa.

The territories possessed by Portugal in Hindostan, exclusive of Damann and Diu, are confined to the district around Goa, 40 m. in length by 20 in breadth, below the W. ghats, having N. the dom. of Sattarah, E. and S. the British territories, and W. the ocean; with a total pop. of about 417,000 inhab. Goa was taken from the Hindoo sovereigns of Bijanagur by a Mohammedan prince of the Bhamanee dynasty in 1469; and in 1510 was besieged and taken by Albuquerque, who made it the cap. of the Portuguese possessions in India. During the 16th century, the Portuguese were masters of a number of places on the sea-coasts of India, but their territories at no period extended far inland. In 1807, Goa fell into the hands of the English, who held it till 1815. During the late civil war in Portugal, this colony declared itself in favour of Donna Maria I. (*Hamilton's E. I. Gazetteer*, &c.)

GODALMING, a bor., town, and par. of England, co. Surrey, hund. of the same name, 4 m. S.W. Guildford, and 31 m. S.W. London, on the Wey. Area of parish (including the 8 tithings), 8,470 acres. Pop. in 1831, 4,529, of whom 2,659 were included in the town tithings. The town, situated in a valley, is nearly surrounded by high and steep ground. It consists principally of one street, which extends about ½ m. along the

GODAVERY.

high road from London to Portsmouth, but it is narrow, badly paved, and insufficiently lighted. The village of Crowmptis stands about $\frac{1}{2}$ m. S.E., and that of Ferncomb about the same distance N.E. of the town; and both are nearly united to it by houses. The church is spacious, with a lofty steeple containing eight bells; the living a vicarage in the patronage of the Dean of Salisbury. There are places of worship for Wesleyan Methodists, Baptists, Independents, and Quakers. On the common, about 1 m. from the town, is an almshouse for 10 old men, founded in 1622. The bridge, which is of brick and stone, was opened in 1783. Attached to the church is a good charity school, and there are several Sunday schools in the town.

Godalming, anciently a clothing town of some note, at present possesses very little importance beyond being a place of considerable thoroughfare. There are four or five mills on the river for the manufacture of paper, parchment, and leather, at which about 50 hands are employed; and the manufactory of cotton stockings gives employment to about 80 persons. (*Mun. Bound. Rep.*) All the mills are worked by water-power. Timber, bark, and hops are exported. The river Wey is made navigable from Guildford, under the 33d of Geo. II.; and coals are brought up here in considerable quantities. (*Mun. Corp. Rep.*)

The old corporation of this town consisted of a warden and 8 assistants, and was chiefly governed by a charter granted in the 18th of Charles II. The present government is vested in 4 aldermen (one being warden), and 21 councillors. The local act, regulating the paving, &c., of the town, is the 6th of Geo. IV.; and the rates levied under it average about 310*l.* a year. The poor rates, which are decreasing, were 2,360*l.* in 1835. Markets on Saturday: fairs for horses and farming stock, Feb. 13. and July 16.

GODAVERY, a considerable river of Hindostan, through the central part of which it flows, extending through nearly 90° of long. Its course lies between those of the Nerbudda and Nahanuddy, on the N, and the Krithna, on the S., chiefly through the dominions of the rajah of Berar. It rises by numerous streams in the W. ghats, about lat. 20° N., and long. 74° E., and runs in a direction generally E., but with a slight inclination southward, to near long. 80° E. From this point, it flows mostly S.E. for about 90 m., bounding the prov. Hyderabad N.E., and separates near Rajahmundry (N. Circars) into two arms, which fall into the Bay of Bengal, between lat. 16° 20' and 16° 40', enclosing a fertile delta, with an area of about 500 sq. m. The entire length of the Godavery is estimated at about 800 m., and during the rainy season it is in many parts 1½ m. wide. Its chief affluents are the Wynegunga, with its numerous tributaries, from the N., and the Mangera from the S. Its banks abound with timber, but no very important towns are situated on them. (*Hanilton's E. Ind. Gaz.*, &c.)

GOI, CONDA, a town and fortress of Hindostan, prov. Hyderabad, on a hill about 3 m. W. of the city of that name, and formerly the cap. of an extensive Hindoo kingdom. It is chiefly noted as a *depôt* for diamonds, which are brought to it to be polished and prepared for sale from other marts, mostly in the Balaghaut districts. Its immediate vicinity contains no diamond mines.

GOLDBERG, a town of Prussian Silesia, gov. Liegnitz, cap. circ. of Goldberg-Hainau; on the Katzbach, a tributary of the Oder, at the foot of the *Bresenbirge*, 13 m. S.W. by W. Liegnitz. Pop. (1838) 7,083. It is the seat of the council and judicial courts for the circle and town, and has a high school (*Bürgerliche Schule*) at which Willenstein was educated. The inhabitants are chiefly occupied in weaving woollen cloth, but have also manufactures of fannels, woollen stockings, gloves, &c., and considerable dyestuffs. The town derives its name from a neighbouring gold mine, now abandoned, but formerly very productive. The hamlet of Wahlstadt, about 6 m. E. of this town, is memorable in Prussian history for the decisive and important victory gained on the 26th of Aug., 1813, by Marshal Blücher and the landwehr under his command, over the French under Macdonald. The latter lost 15,000 men, killed and wounded, and 102 pieces of cannon fell into the hands of the conquerors.

GOLNITZ, a market town of Hungary, co. Zips, 22½ m. S.W. Eperies. Pop. 5,000. It is the seat of a mining council and tribunal, and has considerable mines of iron and copper, iron-forges, and cutlery and iron-wire factories. Its inhab. are partly Rom. Catholics and partly of the Reformed Church.

GOMBROON, or BUNDER-ABDAS ("Port of Abbas," an. *Hormuz* or *Harmata*), a sea-port town of Persia, prov. Kerman, but at present belonging to the Imam of Muscat, on the Persian Gulf, nearly opposite the island of Ormuz, about 30 m. S. Kerman. Pop. from 4,000 to 5,000, chiefly Persians, Arabs, and Kurds, with a few Armenians and Bedouins. The town stands on a slope approaching the sea in a barren and desolate

GOODWIN SANDS.

913

country: it is about $\frac{3}{4}$ -ths of a mile in circ., and surrounded by a mud wall. The houses are few and wretchedly constructed, and the people are mostly lodged in huts.* Gombroon appears to have been a town of very little importance before 1622, when Shah Abbas, assisted by the English, drove the Portuguese from the island of Ormuz, and transferred the commerce to this port. Instead of being carried by sea up to Buporah, and the N. parts of the gulph, many of the imports from India and Africa were now landed at Gombroon, and transported by caravans to the interior, so that it became for a time the emporium of Persia. The English, Dutch, and French, for a long period, had large factories here; but towards the close of the 17th century, the route to the interior having become interrupted by wars and commotions, the factories were left to decay or destruction, and the European merchants removed to Bushire, now the centre of the trade. Some remains of the English factory still exist, but the Dutch is the only one in a tolerable state of preservation; it is used by the Imam as an occasional residence. Gombroon appears to present more natural advantages for a commercial town than Bushire, the route from it leading by natural passes into the heart of Persia; and when, some years ago, Bushire remained in a disturbed state, commerce apparently found its way again to this channel. Even now its trade is considerable, and is said to be increasing. Persian carpets, tobacco, and dried fruits form its exports; its imports, which are chiefly piece goods, Indian cloths, and China ware, were estimated, in 1827, at nearly 3 lacs of rupes a year. The Imam, at the same period, collected a revenue of from 8,000 to 10,000 dols. a year from the town. Immediately without the walls are the cemeteries of the former European inhab., and in their neighbourhood are some very extensive tanks excavated by the Portuguese, the length of the largest of which has been estimated at 1 m. (*Whitlock*; *Kemphorne*, &c. in *Geog. Journal* v. and vii., &c.)

GOMEIA, one of the Canaries, which see.

GONDAR, a large city, commonly called the cap. of Abyssinia, kingd. Amhara, prov. Dembea, on the Agrab, about 20 m. N. Lake Tana or Dembea, 270 m. E. by S. Sennaar, and 1260 S.E. Cairo; lat. N. 12° 34' 30", long. E. 37° 20' 15". Pop. said, by Rüppel, to be reduced to 1,000 families. It stands on a lofty eminence, surrounded on all sides by low lands, and, when seen from a distance, resembles more a forest than a city, on account of the quantity of trees that surround its churches. The city is built in a straggling manner, occupying a space about 11 m. in circ.; the houses, which are mean and wretched, are either of plaster or stone, having one story and a high thatched roof. The only structure worth notice is the royal palace, a square Gothic stone building flanked with towers, and one consisting of five stories: it was built under the direction of Jesuit missionaries, in the latter part of the 16th century. A great part is now in ruins; but the lower floors still contain ample accommodation. One room, used as an audience chamber, is 120 ft. long. The churches, of which there are above 40, have no pretensions either to beauty or convenience. There are very few shops, and all goods for sale are exposed in the great square. The people of Gondar have for some years been subject to the ravages of the wild tribes by which it is surrounded. The city is now in the hands of the Gallas, who, for a long period, have been the scourge of the Abyssinians. (*Ritter's Africa*, i. 298; *Gobat's Abyssinia*, 78, 168, 176.)

GOOD HOPE (CAPE OF). See CAPE OF GOOD HOPE.

GOODWIN SANDS, famous and very dangerous sand-banks, off the E. coast of the co. Kent, about 4 m. E. Deal, and stretching N.E. and S.W. about 10 miles. These sands are supposed by some to have once made part of the Kentish land, and to have been submerged about the end of the reign of William Rufus, or the beginning of that of Henry I. They are very dangerous; vessels riding in the Downs being sometimes driven upon them, and generally wrecked; occasionally through the ignorance and carelessness of pilots, but more frequently from the violence of the S.E. and N.E. winds. They are divided into two principal parts by a narrow channel: in many places they are dry at low water, and some spots appear even sooner. The N. division is of a triangular form, lying N. and S., being about 3½ m. long, and 2½ m. broad: the N. end, called the North Sand Head, is about 7 m. from the coast, its position being marked by a light vessel. The Bunt Head, on the W. side is very dangerous. The largest spot that dries on this sand has got from seamen the name of Jamaica Island. The S. part of the Goodwin Sands is about 7 m. in length; at its N. end it is

* Whitlock, in *Geogr. Journ.*, part ii. 1838. Lieut. Kemphorne, who visited Gombroon in 1828, says:—"The houses are flat-roofed, and more commodiously built than those on the coasts of Sind and Malabar, but the streets, as in all oriental towns, are very narrow and dirty."

about 2½ m. in breadth, gradually diminishing towards the S.W. till it terminates in the narrow point called South Sand Head, marked by a light-vessel, moored about 3 m. from shore. But it is right to observe, that the position of these sands varies more or less every year, through the joint influence of storms and tides.

GOOLE, a town and river-port of England, W. Riding co. York, on the Ouse, 22 m. W. Hull. A few years ago Goole was an obscure hamlet; and is indebted for its rapid rise to its situation on the Ouse, at the point where it is joined by the canal, belonging to the Alre and Calder Navigation Company, from Ferrybridge; and to its also being contiguous to the junction of the Don with the Ouse. To accommodate the shipping, engaged in these great lines of internal navigation, two extensive docks, and a harbour communicating with them and with the river, have been constructed. Warehouses of sufficient security having also been built, Goole was made a bonding port in 1823; and it has since continued to increase in pop. and importance. In 1839 the gross customs' duties collected at Goole amounted to 79,004. The distance inland, and the difficulty of navigating the Ouse, are the principal drawbacks on Goole; but vessels drawing 15 and 17 ft. water have, by taking advantage of the tide, reached it in safety.

GOREE, an isl. and town adjacent to the W. coast of Africa, in lat. 14° 39' 55" N., long. 17° 26' 25" W., on the S. side of Cape de Verd, belonging to the French, and forming a part of their colony of Senegal. The island is merely a barren rock, about 3 m. in circuit, very steep on the W., E., and S. sides, and having in its centre a small elevated plateau, on which is Fort St. Michael, commanding the town. On the N.E. side of the island is a small harbour, affording good anchorage for eight months of the year. The town of Goree occupies more than 2-3ds of the island. Pop. (1836) 4,860, of whom only 18 were Europeans. Its streets are rather narrow, but straight and clean; its houses, built of basalt cemented with mortar, are terraced in the Italian style. It has a civil and commercial tribunal, and is an entrepôt for guns, Senegal, ivory, gold-dust, and other productions of the coast. The island is deficient in water, which has to be brought from the mainland; but it is said to be healthy. It was taken possession of by the Dutch in 1617; by the English in 1663; by De Ruyter two years afterwards; and by the French in 1677.

GORIZITZ (Germ. *Gorz*, Ital. *Gorizia*), a town of the k. of Illyria, gov. Trieste, cap. circ. of same name, and on the Isonzo, 12 m. from the Adriatic, and 21 m. N.N.W. Trieste. Pop. (1838) 8,252. It is composed of an upper and a lower town. The first, situated on a hill, is the more ancient; it is surrounded with walls, and has a partly ruined castle, formerly belonging to the counts of Görz, now used as a prison; the second, situated beneath the former, is a well-built town, its houses being mostly modern, and its streets clean and furnished with footpaths. Goritz has a fine cathedral, 4 other churches, a handsome bishop's palace, and other noble residences, some barracks, occupying what was formerly a Jesuits' college, a circle-hall, town-house, almshouses, and an elegant new theatre. It is the seat of the superior tribunal of the circle, and of a non-suffragan bishop; and has an episcopal seminary for the whole gov. of Trieste, a philosophical academy, gymnasium, superior female school, belonging to Ursuline nuns, a Friarist college, Jews' school, teachers' academy, and a society of agriculture and arts. It has 8 sugar-refineries, silks, ro-soglio, leather, and various other factories, dye-houses, and a brisk general trade. The ex-king of France, Charles X., died at Goritz in 1836. (*Centur. Nat. En cyclop. Berghaus; Compend.*)

GÖRLITZ, a town, Prussian Silesia, gov. Liegnitz, cap. circ. of same name, and of the Neisse, 52 m. W. by S. Liegnitz. Pop. (1838) 13,670. It is walled, and is entered by 6 gates, and has 3 suburbs. The town is in general well built, and in a flourishing state, with wide streets and spacious squares. It has several fine public edifices, including the church of St. Peter and Paul, an edifice of the 18th century, the town-hall, &c. There are 4 hospitals, a prison, orphan asylum, gymnasium, and 3 public libraries. It is the seat of the council for the circle of the courts of justice for the town and circle, the principality of Görlitz, &c., a board of taxation, and the Oberlausitz association of arts and sciences. A good deal of linen and woollen cloth is made here; there is also an active trade in the linen fabrics and wool of the surrounding districts. The manufacture of steel and iron wares, bell-casting, tanning, lithographic and other printing, linen bleaching, &c., are the other chief branches of industry.

GORUCKPOOR, a distr. of British Hindostan, presid. Bengal, prov. Oude, between lat. 25° 40' and 37° 40' N., and long. 81° 00' and 84° 30' E., having N. Nepal, E. the distr. Sarun, S. those of Ghasipoor and Jaunpore, and W. the dom. of the nabob of Oude. Area, 9,930 sq. m. Pop. not specified in the returns. The

Gogra divides it into two portions, Azimghur and Goruckpoor Proper. The former division many years ago contained about 360,190 begas of land in cultivation, assessed at 554,135 rupees; and the latter, 363,673 begas in cultivation, assessed at 792,205 rupees. A great extent of the surface consists of jungle-forest, inhabited by elephants and other formidable wild animals; and as the foot of the hill ranges there is a very extensive, low, marshy, and unhealthy tract of country called the *terai*. Chief towns, Goruckpoor the cap. and Azimghur. Total public revenue (1829-30) 169,590. This territory came into the possession of the British by cession from the nabob of Oude, in 1801.

GOSLAR, a town of the k. of Hanover, distr. Hildesheim, on the Gose, a tributary of the Ocher, at the N.E. foot of the Harz, 44 m. S.E. Hanover. Pop. 7,900. It is one of the most ancient towns of Germany, and was, till 1801, a free town of the empire; often the residence of the emperor, and formerly the seat of the diet. It is walled, and has a very antique appearance. Like most old towns, its interior is gloomy; and the streets narrow, crooked, and dirty. Its greatest curiosity, a cathedral finished in 1050, was almost wholly pulled down in 1820; little now remaining of it except a small chapel, containing an ancient Saxon altar, and some other curiosities. Part of a palace, built in the 9th or 10th century, is now used as a corn-warehouse. Goslar is the seat of the mining council for the Harz, and of the corn-magazines for the same district. It has several churches, an hospital, gymnasium, several breweries, the beer of which enjoys great celebrity; manufactures of virgins' sheet-lead, shot, copper and iron wares, carpets, &c. Most of the inhab. are Lutherans, and employed in the mines of the Rammelsberg, about 1 m. from the town. (*Berghaus, &c.*)

GOSPORT, a sea-port and market-town of England, co. Hants, hund. Titchfield, par. Alverstoke, opposite to and separated from Portsmouth by the mouth of Portsmouth harbour, 14 m. S.E. Southampton, and 6½ m. S.W. London. "Gosport forms no part of the bor. of Portsmouth; it is not incorporated; it is subject to the jurisdiction of the county magistrates. It contains about 7,000 inhab. (now (1835) 12,000), and is computed to have 500 or 600 houses of the value of 10*l.* (annually) within the town. It is surrounded by fortifications, which appear to be a segment of those of Portsmouth." (*Boundary Report, Portsmouth*.) These fortifications include, not only the town of Gosport, but the government establishment of Wool, separated from the former by enclosed fields. Gosport and Wool together occupy the E. extremity of a point of land between two inlets of Portsmouth harbour; the northern of which is called Porton Lake, and the southern, Haslar or Alverstoke Lake. The town consists chiefly of one broad street, containing many good houses, running W. from the shore through its whole extent; one or two other streets running parallel with the former; and several more crossing them mostly at right angles. It is in general pretty well built and paved, clean, well lighted with gas, and well supplied with water. Towards its N. side, it has a tolerably good square, termed Cold Harbour: it has few public buildings worthy of remark. The church, a neat and spacious edifice, is a curacy of Alverstoke; there are independent, Rom. Catholic, Baptist, and Methodist chapels, an academy for ministers of the first-mentioned sect, several charity schools, some almshouses for poor widows, an extensive brickwell, and an assembly-room at the principal hotel. A large building was, in 1811, erected by shares, in a conspicuous situation on the shore, for a market-house; but it proved a losing speculation, and is no longer devoted to that purpose. Its lower part has long been shut up; its upper part is at present used for the meetings of the Ferry Cove Lake, and the Philosophical Society. The town is quite open on the side of the harbour; there is a ferry for the conveyance of passengers to Portsea and Portsmouth; and a floating bridge, to communicate between Gosport and the latter town, has recently been commenced (respecting which, see PORTSMOUTH).

On the land side, beyond the gates, is the populous suburb of Bingham-Town, in which is the terminus of a railway, intended to join the South-western at Bishopscote. The inhab. of Gosport are of the same description as those of Portsmouth, follow the same pursuits, and partake equally of the benefits which result from the public establishments. (*Bound. Rep.*) In time of war, Gosport shares in the commercial activity that prevails on the other side of the harbour. Some vessels and boats are built, but there are no other manufactures of consequence. There are 2 fairs annually, but they are of no importance.

The establishment of Wool comprises the royal brewery, and cooperage; storehouses for provisions of all kinds for the navy, &c.; an extensive ship-bliscuit manufactory, wrought by machinery; and the General victualling department, removed thither from Portsmouth in 1827-8. It communicates with the sea by a

large basin and canal, where ships of large burden take in stores. Near Wevill are some extensive military barracks. N. of Forton Lake is Priddy's Hard, where is a large powder magazine. At Forton there was formerly a brick edifice of considerable size, in which many French prisoners were detained during the late war; but it has been pulled down. On the S. side of Haslar Lake stands Haslar Royal Hospital, a magnificent asylum for sick and wounded seamen. It was commenced in 1746, and finished in 1762. It is built of brick, and consists of a central portion 570 ft. broad, with two wings, each about 550 ft. in length, the whole surrounded by a high wall, enclosing an area of nearly a mile in circuit. It is capable of at once accommodating 2,000 patients; and has, besides apartments for the numerous officers connected with it, a neat chapel, a fine museum of natural objects, &c. The annual expenses of Haslar Hospital are estimated at about 8,000*l*. At Stoke Bay, about 2½ m. S.W. Gosport, the handsome watering-place of Anglesea-ville has grown up since 1825, and is rapidly rising into importance. Gosport is a polling-place for the S. division of Hants. (*Boundary Reports; Private Information, &c.*)

GOtha (PRINCIPALITY OF). See COBURG-SAXE-GOTHA.

GOtha, a town of central Germany, cap. of the above principality, and, conjointly with Coburg, the residence of the sovereign prince; on the declivity of a hill, the summit of which is crowned by the palace of Friedenstein, 4½ m. N. by W. Coburg, and 12½ m. W. by S. Erfurt; lat. 50° 56' 30" N., long. 10° 44' E. Pop. (1837) 13,874. This is one of the best laid out and best built towns of Germany, and is surrounded by handsome boulevards, which replace its ancient fortifications. Being situated from 900 to 1,080 ft. above the level of the sea, its climate is cold, the mean temperature of the year not exceeding 49° Fahr. *Bergheim*. "The palace, called Friedenstein, is an imposing building, conspicuous at a distance, not unlike Windsor Castle in its situation, and surrounded by similar terraces, commanding fine views." (*Murray's Handbook, N. Germany*.) It contains a picture-gallery, in which there are some good paintings by Italian masters, though the works of the old German and Dutch schools predominate; a collection of copperplate engravings; a library of 180,000 vols.; a cabinet of coins, &c.; a museum of natural history and the fine arts; and a Japanese and Chinese museum, containing Chinese and Japanese books, articles of furniture, weapons, &c., including a part of the collection of the eastern traveller, Seetzen. The cabinet of coins and medals is both extensive and complete, and considered one of the finest collections of the kind in Europe: it comprises nearly 10,000 ancient and 52,000 modern coins, 13,000 impressions in sulphur, a numismatic library of 6,000 vols., 9,000 drawings of medals, &c. The town of Gotha has seven churches, an arsenal, a gymnasium, with an excellent library, a new ducal gymnasium, orphan and lunatic asylums, a house of correction, an institution for the improvement of neglected children, the Caroline establishment for poor girls, a teachers' seminary, school of trades, society for the encouragement of arts and trades, and a fire and life assurance office, from which policies may be obtained for any part of Germany. Gotha has a large manufactory of porcelain; and produces cotton, woollen, and linen fabrics and yarn, sail-cloth, leather, tin and lackered wares of all kinds, fire engines and buckets, coloured paper and furniture, and has numerous dyeing-houses. It has an active and extensive trade, and, amongst other articles, Gotha sausages are sent to all parts of Germany. The *Aimanach de Gotha*, an excellent publication, to which we are frequently indebted, is published in this town. A little to the S.E. is the observatory of Seesberg; and not far from the palace is a pleasure-house, with a fine garden and orangery, and a ducal park ornamented with statues, &c. The author of a *Tour in Germany in 1820-22*, observes, in speaking of Gotha,—"It has more the air of a town than Weimar, but has not more of the bustle of life, and far less of its pleasures and elegant enjoyments. . . . Some people would not reckon the want of a theatre a misfortune in a town; but, in a small German capital, where the court affects no parade, nothing could be a surer sign of its Trophonian qualities. The Goths occasionally pack themselves into coaches, and make a journey of 40 miles, even in the depth of winter, to hear an opera in Weimar." (i. 324, 325.) The foundation of Gotha is attributed to William, archbishop of Mayence, in 964. (*Berghaus; Cammelsch; Diet. Geog.*)

GOTTENBURG, or GOTHENBURG (Swed. *Gasteborg*), a sea-port city of Sweden, and the second in that kingdom, in the W. part of which it is situated; at the head of a fiord, near the Cattegat, which receives the Gøta, about 960 m. S.W. by W. Stockholm, and 187 m. S.S.E. Christiania. Lat. 57° 42' 4" N., long. 11° 57' 45" E. Pop. (1833) 28,758. (*Forssell*.) It stands principally in a marshy plain, surrounded by precipitous ridges of naked rocks, from 100 to 300 ft.

high; but partly on the heights to the W.; being thus divided into the Lower and Upper town. The former is intersected by numerous canals, and has an appearance very similar to that of the towns in Holland. The entrance to Gottenburg from the S. is extremely fine: the slope of the hill, along which the road winds, is covered with houses whose shaded gardens spread beautifully up the height behind, while in front are long terraces, and neatly-clipped harbour walks, all mingling richly among large trees of southern foliage. You enter the city by a good bridge, and, on advancing, the lofty flat-roofed houses, all built of stone, or of well-stuccoed brick,—the wide streets, regularly paved, with foot-walks, laid down in 1838 and 1839, the deep canals, with which the place abounds, displaying rows of trees on either bank—all help to keep up the illusion that you can scarcely be in the far north. (*Brenner, Excurs.* i. 297.) Since 1834 the town has rapidly increased: most of the empty spaces inside have been built upon, and the rent of houses has risen 35 and 40 per cent. Many of the houses in the Upper town are erected upon the steepest ridges of the rock, rising one above another in situations apparently the most perilous and insecure; these, however, together with the bold scenery round the city, and the harbour thronged with vessels and boats in front of it, give Gottenburg a very picturesque appearance. It is defended by three forts. The suburbs are larger than the town itself, and stretch for a considerable distance along the fiord. The city has several large squares and market places, and some tolerable hotels; there are, however, few public edifices or other objects worth notice. The principal are the exchange, the extensive buildings belonging to the E. India Company, an hospital, and a magnificent church, built since 1812, with stone from Scotland. The exchange is handsome, large, and splendid enough for a commercial city of the first class. The city has three churches, one being a cathedral, a Moravian chapel, two orphan asylums, a gymnasium, Prince Oscar's school, in which 100 soldiers' children are educated, a free school for the education of 300 poor children, and the board of 200 do.; with Sunday-schools, and many benevolent institutions. It has also an arsenal, custom-house, 2 banks, a theatre, barracks, and docks for ship building, and is a place of considerable manufacturing activity. Within the last 10 years 3 large cotton mills and 1 large sail-cloth and iron manufactory have been built, and are in full operation: the machinery was brought principally from England and Belgium. There are, also, several factories for weaving common printed cotton goods. In addition to these, there are manufactures of tobacco, refined sugar, glass, paper, &c.; but most of these are upon a limited scale. There is a considerable porter brewery, the produce of which is famous throughout the N. of Europe. The establishment is in the hands of a Scotchman; and Mr. Brenner says that the article produced is "more like London porter than any thing made under that name out of England." Considerable quantities of it are exported to Russia." (P. 298.)

The harbour is the most conveniently situated for foreign trade in Sweden. It is formed by two long chains of rocks, and protected at its mouth by the fort of Nya-Elfsborg, built at the extreme projection of a long rocky island, running into the Cattegat. Immediately within this fort, where the fiord is not half a mile wide, the larger vessels trading to the port usually remain, while those of smaller burden proceed some distance further, to Klippan, an extensive suburb of Gottenburg, from whence the inner harbour commences. Vessels do not come close to the city, but lie in the river or harbour at a short distance from the shore, goods being conveyed from and to them by lighters that navigate the canals of the Lower town. The depth of water in the port is 17 ft.; and there is no tide, bar, or shallow. A vessel entering the Gøtha (fiord) must take a pilot on board, whose duty it is to meet her half a league W. of Wilgö beacon. After Stockholm, Gottenburg has the most extensive commerce of any town in Sweden. Iron and steel, the former excellent, the latter inferior to that made in England, form the principal articles of export. They are brought from the rich mines of Wermeland, distant about 200 m.; being conveyed by the lake Wener, the Tröllhösta canal, and the Gøtha. The exports of iron, in 1839, amounted in all to 191,150 skib.; of which 134,630 went to the U. States, 35,180 to England, 21,240 to sundry places.

The original cost of iron is supposed to be increased about 5 per cent. by the expense of conveyance to Gottenburg; and the shipping charges, inclusive of the export duty, are about 10 per cent. additional. The next great article of export is timber, particularly deals, which are also furnished by Wermeland. The exports of deals (1839) were 148,680 dozen; of which, 64,870 dozen went to England, 41,840 do. to France, 21,480 do. to Belgium, 20,460 do. to sundry places.

The export duty on timber is not heavy. The other articles of export are linen, sailcloth, tar, copper, alum,

glass, cobalt, manganese, linseed, oak bark, bones, juniper berries, cranberries, rock moss for dyeing, &c. The principal articles of import are sugar, coffee, tobacco, cotton yarn and twist, salt, indigo, dye-woods, South Sea oil, rice, wine, spices, herrings, &c. Göttingburg used, at no distant period, to be one of the principal seats of the herring fishery; but at present this branch of industry is quite extinct, and it has always been very capricious, the fish alternately swarming on, or altogether deserting the coast. Since 1812 they have entirely disappeared; so that Göttingburg, instead of exporting, at present imports considerable supplies of herrings.

There belonged to the port, in 1837, exclusive of river craft, 72 vessels of the aggregate burden of 6,354 Swedish lasts, or 15,250 English tons, which had increased in 1839 to 8,100 lasts, and in 1840 to about 9,600 do.; and ship-building is going on briskly. The opening of the Göttha canal, by which Göttingburg communicates with a large part of the interior of Sweden, and ultimately with Stockholm, by means of an extensive system of inland navigation (respecting which, see SWEDEN), has exercised a material and beneficial influence upon its commercial destinies, particularly now that the locks have been enlarged, rendering the canal passable for a larger class of vessels than previously. The trade with England is extensive, and English is generally understood in Göttingburg. Steamers run once a week between Göttingburg and Hull for 8 months of the year; but in winter intercourse takes place only by the tedious route of Lübeck and Hamburg. Goods may be bonded for any length of time in the warehouses of the city, on payment of ½ per cent. *ad valorem*.

Göttingburg is the see of a bishop, the residence of a military governor; and the seat of various courts of justice, and a chamber of manufactures. It has an academy of sciences and literature, incorporated 1775. It was built on its present site by Gustavus Adolphus, in 1611.—It has frequently suffered severely from fire. (*Private Information.*)

GÖTTINGEN, a town of W. Germany, k. Hanover, cap. princ. of same name, distr. Hildesheim, 58 m. S. Hanover, and 34 m. N. Cassel; lat. 51° 31' 58" N., long. 9° 56' 42" E. Pop. 10,900. (*Berghaus.*) It is pleasantly situated on the banks of the Leine, in a beautiful and fertile valley, 512 ft. above the sea, at the foot of the mountain of Haimberg. The town, which is divided into three parts, the old and new town, and Masch, is walled round, and has four gates. The ramparts are planted with trees, and form a pleasant walk for the inhab. Streets broad and well paved; but the houses, though old, appear neither venerable nor picturesque. There are three squares, the largest being the market-place, with a handsome explanade and fountain in the centre, three Lutheran churches, a Reformed church, and a Rom. Cath. chapel. The church of St. John's has two steeples, each 200 ft. high; and St. James's is 300 ft. high. The University church was opened in 1822. The other chief buildings are, the university-hall, finished in 1837; the court of justice; the lying-in hospital; the observatory, in the S.E. suburb of the town; and the theatre of anatomy: of these, the first and last two are chaste and elegant structures. A school of industry was founded in 1748. The trade of the place, independently of the university, is quite insignificant; the sale of books, and the manufacture of sausages and tobacco-pipes, are the only thriving branches. (*Berghaus.*)

The university, founded by George II. in 1734, and chartered in 1736, as the *Academia Georgica Augusta*, with an endowment out of the revenues of some secularized monastic property, was, down to 1831, only entitled to its appellation, "the queen of German universities," both on account of the celebrity of its professors, and the number of students flocking to it from every part of Europe. It is chiefly indebted for its early prosperity to the fostering care of its first curator, Baron Munchausen, the king's home minister; and its subsequent success has been owing to the judicious liberality of the sovereigns, who, while cautiously watching its progressive efficiency, have not changed the direction of their bounty, or doled out its supplies with a niggard hand. The first course of lectures was begun by Gebauer the civilian, in 1734; and in the century since elapsed no less than 230 professors have given instruction, most of them, in every branch, possessing a higher degree of talent than those attached to any other university in the country; among these were Houtmann, Noshelm, Schleuser, Michaelis, Eichhorn, and Ewald, in theology; Gebauer, Spangenberg, Wahl, Hugo, and Bergmann, in law; Gesner, Heyne, Schlözer, Müller, Grimm, and Heeren, in philosophy and history; Haller, Blumenbach, Langenbeck, Schröder, Baldinger, Conrad, and Oslander, in medical science; Gmelin and Stromeyer, in chemistry; Zenn, Hoffman, and Schrader, in botany. The entire number of matriculated students during the first century of the university's existence, was 39,736; the greatest attendance being between 1823 and 1826, when the average was 1,461 annually. Since 1831, however, in consequence of

the political disturbances at Göttingen, in which the professors and students were implicated, the university has fallen into disrepute, and the numbers in the years 1831-37 averaged only 868 annually. The oppressive measures of King Ernest in 1837, which drove Grimm, Ewald, Dahlmann, &c. to other universities, have still further injured it; and the students in 1839, according to Reden, had declined to 664, of whom only 200 were foreigners, that is, not Hanoverians. The gross annual expenditure of the university is about 160,000 rix-dollars (about 50,000*l.*), nearly half of which goes to enrich the library and museum, the rest being divided among about 32 ordinary professors, whose salaries vary from 80*l.* to 360*l.* a year. The professors altogether, including private tutors (*privatim docentes*), are reckoned by Reden at 90. The students in Göttingen are not compelled to reside within college, nor tied to stated hours of discipline, nor forced to oaths of orthodoxy; each lives in any part of the town he likes, takes his meals how, when, and where he pleases, and even pursues his own course in the choice of his academical studies. Their age at entrance varies from 17 to 20, and they usually continue here four years, the periods of study occupying ten months in each year; the winter *semester* lasts from Oct. to March, that in the summer from April till the end of Aug. There is a preliminary examination for the Hanoverian students, called *Maturitäts-prüfung*, which all must pass who wish to serve the state in the learned professions. In 1838, the number passed was 134. This probation, however, is not required of foreigners. The matriculation fee is one louis-d'or, or 1*l.*, and this admits to the use of the library, and to attend lectures. Of the lectures, some are *public*, and may be attended without any additional fee; but the greater number are private, the fee being a louis-d'or for each semestral course of daily lectures. The medical fees are higher. Many of these lectures are delivered in public auditories, especially those of the medical faculty: some professors have private classrooms. The medical and public lectures are very numerously attended: the attendance at the rest varies from 50 to 150. Not less than 140 courses are delivered by the whole body of teachers during each *semester*, and several have two or three courses on different subjects proceeding contemporaneously. The expenses of students must greatly depend on their habits. Saalfeld, in his edition of Pütter's History of the University, mentions 360 rix-dollars a year, as sufficient for respectable maintenance; but this is too low a calculation, 400 or 430 rix-dollars (about 90*l.*) being, it is alleged, the lowest sum that can be spent consistently with comfort and convenience for study. For the poorer scholars there are 204 *Freistück-stellen*, the sum paid for board, and a number of scholarships (*Stipendia*), to which purpose 6,413 rix-dollars are annually devoted, (*Reden*, ii. 447.) With reference to degrees, the university is composed of four faculties—divinity, law, medicine, and philosophy, each of which confers its own degrees. The faculty of divinity confers the degree of licentiate in theology and doctor of divinity; that of law, the degree of doctor of laws; that of medicine creates doctors of medicine; while the philosophical faculty confers the degree of doctor of philosophy and master of arts. All these degrees are consequent on disputation and examinations approved by the deans of the respective faculties. These degrees, however, though generally pre-requisites, confer of themselves no right of practising the learned professions in Hanover. This is gained by a subsequent government examination. The members of these faculties consist altogether of 20 professors, from whom ten are chosen to form the *Senatus Academicus*. The judicial government of the university, which acknowledges no control beyond that of the king or Hanover, is vested in *seniores*, and its two curators, who appoint the salaried professors, &c., is conducted by the pro-rector, or principal, an officer elected each *semester* by the professors from among themselves, who is assisted in his duties by two judges, a secretary and recorder, all of whom, likewise, are professors.

The chief academic establishments of Göttingen are: 1. The library, consisting of more than 200,000 printed books, and 5,600 MSS., admirably selected and arranged, to which the students have full access, with the additional privilege of taking the books home; 2. The academical museum (founded in 1773, and removed to its present depository in 1793), consisting of 14 rooms, filled with several thousand specimens of zoology, mineralogy, and geology, besides others explanatory of the manners

* Heeren, in his *Life of Heyne*, observes respecting the library:—"Better show collections may be found elsewhere; but the great recommendation of the Göttingen collection is, that it has been made for use, not show, and that the student finds in it every thing which he would see or handle in his science." Heyne was the chief promoter of the arrangements under which this library has acquired its great and just celebrity. See an account of them in *Journal of Education*, No. 3.

and customs of different nations, and a curious collection of models; 3. The observatory, first erected in 1751, and removed to its present site in 1816, containing an apparatus of excellent modern instruments, and every accommodation for astronomical observers; 4. The botanic garden, first laid out under Haller's superintendence in 1759, but now more than quadrupled in extent, and provided since its removal with beautiful green-houses, adapted to plants of all temperatures, and ponds for aquatic plants; 5. The chemical laboratory, constructed by Gmelin, and perfected by Stromeyer, who provided it with an apparatus for experimental students; 6. The school of anatomy, first established by Haller in 1738, and since 1829 held in a fine building containing a spacious theatre and dissecting-rooms; 7. Two infirmaries for medical and surgical cases, and a lying-in hospital, accommodating about 120 pregnant women a year. 8. The *Sprach-Kollegium*, or court of equity, composed of a president and several subordinate members appointed by government, which serves the double purpose of a court of judicial advisers in legal questions sent from all parts of Germany, and of a school for the legal students; 9. The Homiletic seminary, for the instruction of divinity students in preaching and pastoral duties; 10. The philological seminary, founded by Gesner in 1737, and under the direction of three professors, which gives minute philological instruction to 11 stipendiary students (paid 50 dollars each every year), and as many more as the director pleases to admit, after the regular examination. The last three establishments have been eminently successful in raising up useful and able men in the professions to which their instruction leads. Nearly connected with the university is the Royal Society of Sciences, established by Geo. II. in 1751, on a plan suggested by Haller, and well known to the *scavans* of Europe. Its transactions are published in Latin, and may be considered a repository of all the original views in literature and science started in Göttingen by the professors of the medical and philosophical faculties. An annual prize of 50 ducats (24*l.*) is open to persons of every country for the best essay on mathematics, physics, and history alternately. This society is the patron and superintendent of the *Göttingische Literary Review* (*Göttingische gelehrte Anzeigen*), which, having risen to eminence under the editorship of Haller, has since been conducted by Heyne, Eichhorn, and Heeren, the last of whom is the present editor. Two large 8vo. vols. are published yearly, and the work has throughout been distinguished not only for exalted talent, but for a tone of moderation and strict adherence to truth: these qualities alone have enabled it to outlive the various and important political changes of the country. (*Redn's Hannover*, ii. 435—449; *Journal of Education*, No. xx.; *Priv. Inform.*)

GOTTLAND, an island of the Baltic, belonging to Sweden, in the *Län* of the same name, lying between lat. 56° 52' and 27° 06' N., and between 13° 8' and 19° 8' E., dist. 60 m. from the continent of Sweden. Greatest length, 75 m.; ditto breadth, 26 miles; 1,194 sq. m. Part of the *Län*, sometimes called Wisby *Län*, which includes the small surrounding islands, in 1830, 38,954. (*Forssell*.) This island presents the appearance of a large plateau, varying from 150 ft. to 200 ft. above the sea. Its sides, which in some places, gently slope towards the sea, are so steep and precipitous in others, as to look like artificial walls. The coasts are indented by several bays, the largest of which are Kapelhamn on the N., and Sjöthamn on the E. The high lands, except the barren summits of Thorsburg and Högur, are generally well wooded. There are several small lakes. The rivers are few and inconsiderable. In some parts swamps occur, but of no great extent. The geological features of the island, though generally calcareous, vary extremely, especially in the S., where occur large masses of hard grey sandstone containing mica, and susceptible of a high polish. The soil is either calcareous or sandy, and would be very productive if better cultivated. The chief products are wheat, barley, oats, turnips, potatoes, and hops, which are grown only for home consumption. The forest trees are large and handsome, and they furnish timber for exportation. The only other exports are marble, sandstone, and lime, which are sent to Stockholm. The rearing of cattle occupies a considerable share of the people's attention. Horses, goats, and sheep are reared in large numbers; and the breed of sheep has been improved by the introduction of Merinos. Game is very plentiful. There are no manufactures on the island. The *Län*, of which Gottland forms a part, is divided into 20 districts; and the sea-port town of Wisby, on the W. side of the island, is the cap. Pop. of the latter, in 1856, 4,091. (*Forssell*.)

The epoch of the foundation of Wisby is uncertain; but during the 14th and 15th centuries it was a principal factory of the Hanseatic League, and attained to considerable wealth and importance. It is famous in the history of maritime jurisprudence, for the Code of Sea Laws which bears its name. The date of this compilation is uncertain, and some of the northern jurists contend that the

Laws of Wisby are older than the Rules of Oleron; but it has been repeatedly shown that there is no foundation for this statement. Grotius has spoken of the laws of Wisby in the most laudatory manner. " *Quæ de maritibus negotiis*," says he, "*insule Gothlandie habitatoribus placuerunt, tantum in se habent, tum equitatis, tum prudentiæ, ut omnes oceanæ societate, non tantum propriæ, sed etiam gentium, jure utantur*." (*Prolegomena ad Procopium*, p. 64.) The text of these laws, with a translation and an elaborate introduction and notes, is given in the excellent *Collection des Lois Maritimes* of M. Pardessus (i. pp. 425—502.).

In 1361, Vladimir II., king of Denmark, took Gottland from the Swedes. By the treaty of 1644, it again became their property; and since then has continued in their possession, with the exception of a short period in 1807, when it was occupied by the Russians.

GOUDA, or TERGOUW, a town of S. Holland, cap. cant., on the Yssel, at the influx of the Gouw, 104 m. N.E. Rotterdam. Pop. 13,000. It is a neat town, with beautifully wooded environs. It is known only in England by its cheeses and tobacco pipes; but in Holland it is famed for its painted windows, chiefly the work of the two brothers Krabeth, and reckoned the finest specimens of their kind in Europe. "They are the windows of the old church of St. John, a large Gothic structure, kept in excellent repair, and particularly clean. The windows are 31 in number, each measuring about 30 ft. in height, with the exception of those of the transepts, which are nearly double that altitude, and all illuminated with pictorial representations, in colours of the most brilliant hues. The subjects are either scriptural or allegorical, and are full of figures, whose robes in blue, purple, and red, shine with extraordinary lustre. The faces are the best part of the execution, the remainder of the figures being painted in a stiff and formal style, though nevertheless interesting from their antiquity. Besides the large windows there are several of a smaller size, chiefly blazoned with the coats of arms of the old Netherlandish nobility." (*Chambers's Tour in Holland*, p. 40, 41.) These paintings were mostly executed in the 15th and 16th centuries; and amongst others are introduced portraits of Philip II. and the Duke of Alva. Besides St. John's (the cathedral) there are 4 other churches in Gouda; and it has, also, a handsome town-hall, an hospital for old men, an orphan asylum, and a foundling hospital. A Latin school, and a library containing several curious MSS., belong to the town. There are upwards of 120 tobacco-pipe manufactories in Gouda, some employing 30 workmen; and numerous brick kilns in its neighbourhood. It has manufactures of woollen cloth, sailcloth, cordage, &c., and large markets for cheese, flax, hemp, corn, timber, and other produce.

GOUR (probably the *Ganga Regin* of Ptolemy), a ruined city of Hindostan, and the ancient cap. of Bengal, distr. Dinagepore, on the E. side of the Ganges, about 50 m. N. by W. Moorshedabad: lat. 24° 53' N., long. 88° 14' E. Its ruins extend in a direction N.W. to S.E., coinciding with the ancient bed of the Ganges, the main stream of which formerly washed its ramparts; at present, however, from a change in the course of the river upwards of 200 years ago, no part of the ruins is less than 4 m., while other parts are as much as 12 m. from the Ganges. The city appears, from the extent of the old embankments, which enclosed it on every side, to have been 10 m. long, and from 1 to 1½ m. broad. Beyond those boundaries, however, a smaller embankment has been carried forward for 7 m. farther S., in which space are found mosques, tanks, and the remains of habitations, and the same indications are evident for 2 m. to the N. The city and its suburbs thus extended in length about 19 m., with an average breadth of about 1½ m.; and, according to the estimates of both Major Kennell and Mr. Creighton, would appear to have anciently occupied an area of 30 sq. m. The embankments surrounding the city, some of which are faced with bricks, were sufficient to guard it from floods during the inundation, and a good defence against hostile attacks: they are mounds of earth from 30 to 40 ft. high, and 130 to 200 ft. in breadth at their base, with broad ditches on their outside. Additional embankments were made on the E. side, probably for greater security against a large lake in that quarter, which in stormy weather dashes with great violence against them. Two high brick gateways, in an imposing style of architecture, at the N. and S. ends of the city, and several others, are still standing, and the remains of some that have been destroyed are still traceable. Two grand roads, raised with earth, and paved with brick, led through the city in its whole length, crossing in their course various canals and drains, by means of bridges of brick, the ruins of several of which remain in some degree of perfection. The whole area of the city is furnished with a multitude of tanks, of various sizes, and intersected with drains and ditches in every direction. On the earth thrown up in forming these, which raised the ground considerably above its previous level, the houses, &c., were built

as in the cities and villages of Egypt; the excavations supplying good water, sufficient for every purpose. One of these reservoirs is a mile in length by half a mile broad, and there are several others of considerable size. All of them are, however, overgrown with reeds, and swarm with alligators and other reptiles. Towards the centre of the city is the fort, an inclosure rather less than a mile in length by about $\frac{1}{2}$ m. in breadth, surrounded with an earth rampart, 40 ft. high, with bastions, and a deep ditch encircling it. The handsome gate, flanked by two towers, forming its N. entrance, is still standing. Within this enclosure is part of a brick wall, 43 ft. high, which surrounded a space 700 yards long by 300 wide, supposed to have been occupied by the palace. Few other remains of that edifice exist, and the whole site is so covered with trees and brambles, as to render it not only difficult but dangerous to explore, from the number of tigers and other wild beasts that infest it.

There are scarcely any antiquities of a remote date extant at Gour; most of the buildings that remain are of Mohammedan origin, erected, indeed, with the materials of the ancient Hindoo edifices. "Tolling through bush and long grass, now trampling a brick wall, 43 ft. high, which has formed, now winding through pools of water, or ferrying across them, you make your way from point to point, and find only the ruins of 7 or 8 mosques, the half-broken down walls of a large Moorish fortress, and two strikingly grand and lofty gates of a citadel evidently built by Mohammedans." (*Sketches of India*, p. 145.) Of the religious edifices, the finest and largest is the "Great Golden Mosque." This building, situated N. of the Fort, is 170 ft. long, by 76 ft. broad, and 20 ft. high, exclusive of the domes, of which there are 44, rising 10 ft. above the roof. (*Creighton*, p. v.) Its walls are 8 ft. thick; it is built of brick, and has been wholly cased with hornblende, little of which is now remaining. Eleven painted arches open into an arena divided by another similar row of arches, and 20 stone pillars arranged in 2 rows, into 4 aisles, each surmounted by 11 domes. This beautiful edifice is now going rapidly to decay, not only from the effects of wanton dilapidations, but also from banian and other trees insinuating their roots between the bricks of which it is composed. The small "Golden Mosque," now trampling a brick wall, is of a somewhat similar style, but has only 5 arches in front, and 3 aisles instead of 4. Many of the inferior mosques are in higher preservation than the first mentioned; their domes are still perfect, and lined within by tiles painted of the most vivid colours, and highly glazed; and one of the smallest has a tessellated pavement of great beauty. The *Nutti Masjid*, or "Painted Mosque," is an elegant edifice, having its walls cased both inside and out with glazed bricks about 3 or 4 in. square, of different colours, wrought in different patterns. Its interior is a handsome apartment, about 26 ft. square, the four walls closing above, and forming a majestic dome from 40 to 50 ft. above the ground, and unsupported by pillar, beam, or rafter. Within the fort is the tomb of Hussain Shah, one of the kings of Gour in the 16th century, a fine mausoleum, now much dilapidated; and at a short distance without the citadel is the obelisk or tower erected by Firoze Shah at the latter end of the 15th century. This structure is 21 ft. in diameter at its base, and as much as 17 ft. at the floor of its fourth story, 71 ft. high. Its entire original height was probably about 100 ft.: it was surmounted by a cupola, of which Mr. Creighton gives a representation, but since his time the dome has completely disappeared.

This city, called *Lakshmanavati* by the Mohammedans, *Lucknow*, from its last Hindoo sovereign, Lakshman, was first taken by the Mohammedans in 1204. In 1574 it was repulsed and beautified by the emperor Akbar, by whom it was called *Jennutabad* (the abode of paradise); but in 1564, the seat of government of Bengal was removed to Tanda, a little higher up the river, owing to which event, and the desertion of it by the Ganges, Gour speedily declined. It, however, appears to have suffered less from the hand of time than from active demolition. For centuries the materials of its structures were extensively removed to construct other towns; Moorahdabad, Mالدah, Rajmahal, Dacca, &c., are in a great part built of them; and many portions of its fine buildings have been taken away to erect the cathedral of Calcutta, and to supply tombstones and monuments for the cemeteries of that city. A few straggling villages are scattered here and there over the site of Gour; but it is now for the most part only an uninhabited waste, which strongly reminds the spectator of the desolation of Babylon. (See *Creighton's Ruins of Gour*; *Bennett's Memoir*, &c.; *Mod. Trav.* ix.)

GOZZA, a small island of the Mediterranean, contiguous to and dependant on Malta, (which see.)

GRAMMONT (Flemish *Gerrardsbergen*), a town of Belgium, prov. E. Flanders, arrond. Audenaerde, cap. cant., on the Dender, which divides it into the upper and lower town, 21 $\frac{1}{2}$ m. S.E.E. Ghent. Pop. with commune (1834), 7,360. It is walled, and has two churches, several

chapels, a town-hall, convent, prison, hospital, orphan asylum, college, several schools, and manufactures of cotton yarn, lace, linen and woollen fabrics, paper, tobacco, some bleaching, dyeing, and tanning establishments, with distilleries, breweries, and mills for various purposes. It was founded and fortified by Count Baldwin de Mons in 1068. (*Vandermaelen, Gautier*, &c.)

GRAMPIANS (THE), a celebrated and well known mountain chain forming the line of demarcation between the Lowlands and Highlands of Scotland. Its limits are not very well defined; but it may be regarded as commencing on the E. side of Loch Eive in Argyleshire, and as stretching across the island, till it terminates between Stonehaven and the mouth of the Dece on the E. coast. It forms, as it were, a natural rampart, bounding the entire frontier of the Highlands. Its S. acclivity rises from the great valley of Strathmore. The summit of the ridge marks the line that separates the waters that flow into the Forth, the Tay, and its numerous tributaries, and the South Esk, from those that flow into the Spean, the Spey, and the Dece. With the exception of Ben Nevis, the highest mountain of Scotland are comprehended in the Gramplan range. The principal summits, beginning at the W. end, and proceeding E., are Craggy Ben, at the head of Loch Awe, 3,330 ft. above the level of the sea; Ben Lomond, on the E. side of Loch Lomond, 3,195 ditto; Ben More, at the head of Glen Lochart, 3,870 (B) ditto; Ben Lawers, on the N. side of Loch Tay, 3,945 ditto; Schiehallion, at the E. end of Loch Rannoch, 3,550 ditto. But the most elevated part of the Gramplan chain lies at the head of the Dece, between Ben Glloe, in Perthshire, and Cairngorm, on the confines of Aberdeenshire and Inverness-shire. Ben Mardhu, the most elevated of the mountains in this vicinity, is 4,527 ft. high, being only 43 ft. lower than Ben Nevis; and the adjoining mountains of Cairngorm, Cairntoul, and Ben Avon, are respectively 4,095, 4,246, and 3,967 ft. high. From this central point, the principal branch of the Gramplains runs along the S. side of the Dece, gradually declining in height till it reaches Gaerloch Hill, near Stonehaven; 1,890 ft. high. The coast from Stonehaven to the Dece is high and precipitous, and may be considered as the extreme limit of the Gramplains on the E. The branch of the Gramplains in this vicinity, of the Dece is of comparatively small extent, terminating at the Buck, above Glenbucket, on the N., and near Tarland, on the S.

The Gramplains are, in general, remarkable for their sterility, and the desolate aspect which they present. Their sides are in some places extremely precipitous, exhibiting vast perpendicular ledges of rock. Their summits are frequently rounded, sometimes nearly flat, entirely covered by disintegrating blocks and stone, together with grit and sand, except where the granite rocks present the singular appearance of large tabular protruding pinnacles, having their blocks seemingly arranged in regular strata.

Of the Gramplan passes, the principal are those of Aberfoyle, Leni, Glenahie, and Killiecrankie. The latter, which is the most celebrated, is about 15 m. from Dunkeld. It is about half a m. in length. The road is cut out of the side of one of the contiguous mountains; and below it, at the foot of a high precipice, in the bottom of the ravine, the river Garry dashes along over rugged rocks, but so shaded with trees as hardly to be seen. At the N. extremity of this pass, the revolutionary army, under Mackay, was defeated in 1689, by the troops of James II., under the famous Graham of Claverhouse, Viscount Dundee, who fell in the moment of victory.

GRAMPOUND, a bor. and market town of England, co. Cornwall, W. div. hund. of Powder, par. of Creed, on the Fal, 12 m. N.E. Falmouth. Pop., in 1831, 715. This inconsiderable place sent 3 mems. to the H. of C. from the reign of Edward VI. down to 1831, when it was disfranchised for gross bribery and corruption.

GRAN (Hungar. *Esztergom* and *Stuhlweissenburg*), a city of Hungary, cap. co. same name, on the Danube, nearly opposite the mouth of the river Gran, 80 m. E.S.E. Presburg, and 26 m. N.E. by N. Pesth. Pop. 12,885. It consists of the royal free town, the archiepiscopal town occupying the site of the former citadel, the adjacent market-towns of St. George and St. Thomas, and several suburbs. Gran was once the finest city in Hungary, and the residence of its kings, some of whose tombs are still to be seen. It is now the seat of the Prince-primate of Hungary, who ranks 3d. to the papal throne, and had formerly the privilege of crowning the king and of granting letters of nobility. The superb new cathedral, the palace of the archbishop, and the houses of the chapter, occupy a commanding position, overlooking the town and river, on the summit of a high and precipitous rock, on which an old fortress once stood. The cathedral, the most splendid modern building in Hungary, was commenced, in 1821, by the late archbishop Rudnay at his own expense; but, by his death, was left unfinished, and it is to be feared will remain so. It is in the Italian style, surmounted by a dome, and having

a handsome portico of 38 pillars. The interior is lined with polished red marble, and supported by 54 columns. The dome is 82 ft. in diameter. The altar-piece, by Hess, a Hungarian artist, represents the baptism of St. Stephen, the first Christian king of Hungary, a native of Gran, who founded the archbishopric in 1001. Under the church is the primate's burial vault. The see of Gran is perhaps the richest in Europe; "common rumour generally estimates its revenues at 100,000*l.* per annum; though some reduce them to 80,000, or even 60,000*l.*" (*Paquet*, i. 181.) The Danube is here of great breadth, but is crossed by a flying bridge, which communicates with the opposite market-town of Parkany. Besides the cathedral it has 2 Rom. Cath. churches, a Greek church, and 4 chapels, town-hall, house of assembly, hospital for poor citizens, a Rom. Catholic gymnasium, female school, and a good printing establishment. It is the seat of the assembly and judicial courts of the county. Its inhab. are partly Magyars and partly of German descent. Their chief resources are derived from trading in wine; but they also manufacture and dye woollen-stuffs. At the bottom of the rock on which the cathedral stands are some warm mineral baths.

Gran was several times taken by the Turks, who destroyed most of its ancient edifices. It was for a long period the advanced post of their armies in Europe; but was finally taken from them, in 1683, by Sobieski and Prince Charles of Lorraine. Upwards of 200 houses, together with the military hospital, chapel, and other public buildings, were destroyed by fire in 1818. (*Oesterr. Nat. Encycl.*; *Elliot*; *Paquet*; *Cannabich*; *Stein*; *Dict. Gog.*)

GRANADA, a prov. and part of an ancient mar. kingdom of Spain, consisting of the S. E. part of Andalusia, between lat. 36° 17' and 36° 29' N., and between long. 1° 51' and 3° 53' W.; and bounded E. by Murcia; N. and W. by Seville, Cordova, and Jaen; and S. by the Mediterranean. Its general shape is that of an acute-angled triangle, whose base faces the E. Its length is about 240 m., and its breadth varying from 25 to 80 m. Area, 9,600 sq. m. Pop. (1827) 1,097,100. (*Mifano*.) The prov. consists chiefly of high land; but three chains may be distinguished,—one forming the N. boundary of the prov., and connecting itself eastward with the Sierra Morena; a second and principal one, traversing the centre of the prov. (called the Sierra Nevada in the highest part, and the Sierras de Loxa, de Antegüera, and de Cazorla, E. and W. of the culminating point); and a third, nearer the shore, called the Alpujarras. The line of perpetual snow here is at 9,915 ft., and in the principal chain are seven summits rising above it, the highest of which are the Cerro de Mulahacen, 11,660 ft., and the Picardo de Veleta, 11,397 ft.; from the last the Sierra Morena, distant 57 m., and the coast of Africa, distant 112 m., may be discerned in clear weather. The slope in the principal chain is more gradual northwards, while on the Alpujarras the N. side is scarped and the gentle descent is towards the sea. The Sierra de Gador in the latter chain, is 5,670 ft. high. From the N. side of the principal chain flows the Xenil, measuring 120 m. to its juncture with the Guadalquivir; and farther E. are the smaller streams, the Guadix and the Barbata,—both affluents of the same river. The rivers on the S., with the exception of the Guadaljore and Almería, are little better than torrents. In this mountainous district are several vallies of considerable extent, the largest of which is the Vega of Granada, a plain 30 m. long, and 16 m. broad, elevated about 2,000 ft. above the sea, surrounded by mountains, and watered by numerous affluents of the Xenil, which traverses it in its whole length, and essentially contributes to its extraordinary fertility. In the E. of the prov. is another valley—the Hoya de Baza,—which, though smaller, is extensive, well watered, and fertile. There are others of more confined extent. The temperature, on account of the varying altitude of the country, is much diversified, but the climate is generally healthy, except occasionally on the coast, where the *simum* produces fever among the inhabitants. The geology of the Granadan mountains is imperfectly known: the Sierra Nevada is of mica slate, gneiss, and clay slate, the whole overlaid on the S. side by black transition limestone containing sulphuret of lead, which here, as well as elsewhere in the prov., is worked to advantage. The mountains generally are rich in Jasper and marbles, especially about the city of Granada, where they eclipse most countries in the beauty, transparency, and polish of the slabs. Precious stones are often found in the quarries. The chief mineral springs of the prov. are at Alhama and Almería. The soil on the hills is calcareous, that on the plains light and easily tilled, while that on the coast is sandy. The forests produce oaks, cork-trees, chestnuts, fir, &c. and the plains bear the vine, the fig-tree, the strawberry-tree, the olive and mulberry trees, and others. Tillage, where possible, is pursued according to the Moorish plan of irrigation, and occupies great attention. The fruits of the S. of Europe,—oranges, citrons, pomegra-

nates, melons,—grow here in great abundance, mingled with the productions of the N. Wheat, barley, maize, rice, hemp, flax, and the sweet potato, are raised in large crops; and on the coast of the Mediterranean indigo, cotton, coffee, and the sugar-cane, are cultivated. Mr. Inglis, on the authority of General O'Lowler (manager of a large estate in the Vega of Granada called *Soto de Roma*, given to the Duke of Wellington by the Cortes in 1813), speaks as follows of the usual rotation of crops in the Vega (ll. p. 183).—"After the land has been fully manured, hemp is put in; and two, or sometimes three, crops of wheat, according to the nature of the land, are taken in the same year; a crop of flax, and a crop of Indian corn, follow the next year, and beans and Indian corn are taken the third year. For this last crop the land is half manured, and then it is fully manured for the hemp, to begin the next rotation. The hemp is considered necessary to prepare the land for wheat, which otherwise would come up too strong after the manure. This is the rotation on land subjected to the process of irrigation." As to the value of land, he says:—"Ten years ago, land in the Vega of Granada was worth from 50 to 100 dollars per acre; at present it does not average above 16. Wheat sold, ten years ago, at three dollars the *fanega*; now it does not average, year by year, more than one dollar and a half. Rents are, of course, fallen in proportion; and, low as rents are, they are difficult to be recovered. Upon the lands not capable of being irrigated, the crops are extremely precarious; and where a money rent is required, it is next to impossible to find a cultivator for the land. As a remedy for this, proprietors of high lands are contented to receive a certain proportion of the crop, generally a fifth; and upon land subject to irrigation, a tenant is willing to pay one-fourth of the produce. Land generally, in the Vega of Granada, returns 4 per cent., taxes paid; but a considerable quantity returns as much as 6 per cent. The return from land under tillage is greater than from meadow land. The estates belonging to the Duke of Wellington lie in the lower part of the Vega, about 2 leagues from Granada, and all the land is capable of irrigation. His Grace's estates return about 15,000 dollars a year; his rents are paid in grain; a fixed quantity, not a proportion of the crop, a plan beginning to be universally followed by other landholders. The duke has 300 tenants; from which it appears that very small farms are held in the Vega; for if the whole rental be divided by 300, the average rent of the possessions will be but 50 dollars each. The tenants upon the duke's estate are thriving; they pay no taxes; and these estates are exempt from many of the heavy burdens thrown upon land. A composition of 6 per cent. is accepted from the Duke of Wellington in lieu of all demands." The mountain regions afford good pasture; but grazing is less understood here than in most other parts of Spain. The horses of Granada are inferior to those of Cordova; and sheep, though plentiful, have very coarse wool. The asses are superior to most others, both in height and strength. Goats are very numerous, and thrive well. Pigs of black breed are reared in great numbers in the woods near Alhama. (*Jacob*, p. 250.) The anchovy and the sunny fisheries give full employment to the inhabs. of the sea-shore.

Except in the articles of wine and oil, the produce of this once fertile prov. does not equal the local consumption. Coarse linen and woollen cloths, silks, paper, leather, and gunpowder, are made in small quantities; but no branch of industry is thriving. Its exports, through Malaga and Almería, chiefly consist of wines, oil, dried fruits, wax, anchovies, and lead; its imports, of hardware and cutlery from England, lace from France, cloths from England and Holland, spices from Italy, and even corn from the coast of Africa!

Granada formed a part of the ancient Bætica; and on the destruction of the Ibero-African empire, it became a new state, founded by Mohammed Alhamar, in 1238. It remained in the possession of the Moors for 250 years, which comprise the season of its prosperity. In 1492, it surrendered to Ferdinand the Catholic, being the last province that opposed his arms. The Moors were, by the treaty of peace, to enjoy freedom of religious worship; but this condition was soon broken, and ultimately they were expelled the prov.

GRANADA (an. *Ilithiria*) a famous city of Spain, cap. of the above prov. and kingdom, on the N. side of the Sierra Nevada, and at the juncture of the rivers Darro and Xenil, in a mountainous region, not less than 2,240 ft. above the sea, 116 m. E. by S. Seville, and 217 m. S. by W. Madrid; lat. 37° 16' N., long. 3° 45' 43" W. According to Mr. Townsend, the pop. in 1786 amounted, by the government returns, to 52,325; but he says that it might be safely estimated at 60,000. *Mifano*, in 1826, gives the pop. at 80,000; but, according to Captain Scott, by whom it was visited, in 1836, the pop. does not exceed 60,000. (*Scott*, i. 267.) We incline to think that this last estimate comes nearest the mark; though we suspect that even it is too high. The city stands on the edge of a fertile and

extensive eggs or plain, which these rivers traverse, on two hills, one of which, between the rivers, is crowned by the palace of the Alhambra and the Torres Bermejas; the other, N. of the Darro, by the Albaycín and the Alcasaba. "From whatever point it may be contemplated, it is a sumptuous city, whether viewed from the plain, or from any of the neighbouring heights; and even in walking the streets, vistas of astonishing beauty are occasionally discovered." (*Ingles*, II. 169.) It still covers a considerable extent of ground, though certainly far less than it must have occupied when swarming with half a million Mohammedans. The approach to it on the Malaga side is particularly fine; a handsome stone bridge, built by the French during the war of Independence, spans the Xenil, and immediately beyond rise crenated walls, and terraced gardens, domes, minarets, and shining steeples, reaching to the base of the rock which bears the Alhambra. Every thing within the precincts of the city bears the marks of Moslem hands: the narrow, crooked, and badly paved streets, and gushing fountains, the lofty flat-roofed houses and heavy projecting balconies, are all quite Oriental; whilst here and there the entrance of some old mosque or ruined bath bears in its horse-shoe arch the peculiar stamp of the morisco. (*Scott's Granada*, I. p. 235.) The city contains a cathedral, a chapel of the Catholic kings, and 23 parish churches, of which those of San Geronimo and San Juan de Dios are best worth seeing. In all of them are to be seen specimens of variegated marble, not equalled elsewhere, perhaps, except in Italy. The cathedral is a clumsy-looking building, 426 ft. long, and 250 ft. wide; the interior is heavy, excessively gaudy, and fitted up in the worst possible taste. The high altar, flanked by its gilded pillars, is insulated after the Roman fashion, under a dome 170 ft. high, and the area round its base is conspicuous by reason of its light iron railing, and marble pavement. In this church is an exquisite Holy Family by Murillo. The chapel of the kings, which adjoins the cathedral, is of Gothic architecture, is noted for a flat arch of remarkable boldness, which supports its roof. Ferdinand and Isabella, and their successors Philip and Joanna, are buried in front of the altar, and their tombs are superbly sculptured. (*Swinhurne's Spain*, I. 301; *Scott*, I. 261.) The Carthusian convent, about a mile from town, which had till lately great wealth and immense revenues, has a fine marble altar, and some excellent paintings by Murillo and Cano. The palace of the Alhambra (*al-hamara*, the red) is, however, the building by which the travellers' attention is chiefly arrested. This irregular mass of houses and towers, perched on a very high hill, which projects into the plain, and overlooks the city, is said to have been erected about 1241. The walls of the fortress follow the various sinuosities of the cliffs, which bound the plateau on which it stands. The chief entrance, which is approached through a long avenue of elms and myrtles, in one of the towers on the S. front, is called the Gate of Judgment; and over it is embossed a key, the armorial ensign of the Andalusian Moors. The first object seen on entering, in the centre of the plateau, is the palace of the emperor Charles V., built by Verreguete. It is a complete square of 185 ft., having two orders of pillars. Doric, Ionic, upon a rustic base, the whole measuring 63 ft. from the higher entablature to the base. An oblong vestibule leads into the circular court, forming the centre of the palace: a colonnade of two stories, each supported by 32 columns, runs round its circumference. This building, so remarkable for "magnificence, elegance, and unity of design" (*Swinhurne*, I. 275.), was never completed; the pillars are much damaged, and the whole will soon fall to the ground. N. of this building, and strongly contrasted in appearance with the palace of the Moorish kings, is externally "a huge heap of ugly buildings as can well be seen." A plain unornamented door admits to the interior. The first place entered is an oblong square, having a deep reservoir for water in the middle, and baths at the sides also, with parterres and rows of orange-trees ranged around; the ceilings and walls being ornamented with intricate stucco and fretwork painted, gilt, and lettered, as in other parts of the building, in the most delicate manner. Beyond this is the Court of Lions, an oblong enclosure, 100 ft. by 60 ft., once paved with white marble but now converted into a garden, and surrounded by a colonnade of about 130* slender white marble pillars, irregularly placed, and supporting horse-shoe arches that run round the place. In the centre is a fountain, supported by 13 lions, or rather panthers, who discharge water into a basin of black marble. The arabesque work here is most elaborate, as may be seen in Murphy's and Laborde's illustrations. N. of the last-mentioned court is the tower of the two sisters, a range of apartments having a beautiful ceiling stuccoed in stalaetites, and beautifully gilded, and a large window opening to the country; and on the opposite side is the Hall of the Abencerrages, where the chiefs of that noble race are said to have been

massacred. The Hall of Ambassadors, however, may be truly called the pride of the Alhambra: it is a square of 36 ft., and is 60 ft. high to the top of the cupola, having a ceiling vaulted in a singularly graceful manner, and inlaid with mosaic of mother of pearl; its walls, also, being adorned with groups of flowers, and fishes intermingled with arabesques of curious workmanship. Highly finished inside, it has also the advantage of extensive views over the city, the dark valley of the Darro, and some other parts of the palace. (*Swinhurne*, Jacob, and Murphy give full descriptions of this gorgeous pile. The gardens, which abound with orange and lemon trees, pomegranates, myrtles, &c., lead by a low postern gate to the summer palace of the generalife, situated on the steep declivity of the opposite hill. In the building itself "there is nothing particularly worthy of observation; but the myrtle groves and terraces are agreeable, and from the latter there is a charming view over the Alhambra and its gardens." (*Ingles*, II. 170.) The pomegranates and muscated grapes of this garden are described by Captain Scott as supremely delicious. Above the palace, near the summit of the rock, is, a seat cut in the rock, which the Moorish kings are said to have used as a point of observation during the siege of Granada. In the city are several hospitals, the largest being that of San Juan de Dios. The university, founded in 1531, had 812 students in 1827. There are also 6 colleges and 2 academies; one for mathematics, the other for design. The walks about the city are most beautiful; especially two alamedas, one on the Xenil, the other on the Darro, the latter being a large cluster of houses grouped together, the other on the Darro, flowing through a deep romantic ravine, whose scenery equals that of Switzerland. (*Ingles*, II. 186.)

Granada, many years ago, had extensive factories for velvets, silks, and ribands, employing 2,000 hands, and working up the produce of the neighbourhood (not less than 2,600,000 lbs. of silk), with large paper-mills, and a flourishing oil trade. But at present its industry is in a very low state, and poverty, with its attendant, crime, has in consequence become prevalent.

This decline in the manufactures and trade of Granada has been ascribed to the emancipation of S. America; and this, probably, may have had some effect. But they had long previously been in a state of paralysis and decay, occasioned by the vicious regulations and the oppressive and injurious imposts to which they were subject. (*Townsend*, III. 70, &c.) The principal existing business is carried on in the market-place, surrounded with despicable houses inhabited by the poorer orders, and in a narrow crooked street called *El Tacatin*, the little market, which in better times was the great silk-mart. Towards the centre of the city is a bazaar in the Eastern fashion, each stall being boarded off from the rest; but in none of these is there much apparent activity.

The Granadians (called the Giscenos of Spain) are proud of their city, and boast not a little of its antiquities and faded grandeur, reckoning themselves at the same time most constitutional citizens. The women are handsome and elegant, like the rest of the Andalusians, but are spoiled by adopting French customs. Like the rest of their countrywomen, they are fond of theatre, masked balls, and the indispensable tertulia. Granada is the see of an archbishop, who formerly possessed a revenue of above 35,000*l.* a year, of which he used to expend a large portion in the maintenance of beggars and other idlers; and was, till lately, the seat of one of the high courts of chancery of Spain. It is at present the residence of a captain-general, and the seat of the audience of the province; and is governed by a corregidor and 2 alcaldes. The Alhambra has its separate governor.

The early history of Granada is hidden in obscurity. Under the Romans, *Illyberis* was a place of some importance, being made by them a municipal colony entitled *Municipium Florentinum Illyberritanum*. The Goths changed the Roman name into *Eliliberi*, and allowed the place to fall into decay. The present city was founded by the Moors in the 10th century, and became a part of the kingdom of Cordova. In 1236 it was strengthened and augmented, in consequence of being selected by Mohammed Alhamar as the capital of his new kingdom. The throne continued in the family of that prince till 1492, when, after a year's siege, it surrendered to Ferdinand and the Catholic. Many Moorish families continued to reside here for a century and a half after its conquest, and contributed to its prosperity and importance. Various attempts to convert them to Christianity were made subsequently to the conquest of Granada; but these having proved, as is alleged, totally unsuccessful, the imbecile, priest-ridden government of Philip III. resolved, at the instigation of a few bigotted ecclesiastics, to expel the Moors from all parts of Spain! This insane resolution, by which the kingdom was deprived of a large number of its most industrious and valuable citizens, was carried into effect in 1609 and 1610, under circumstances of the greatest barbarity. This

* Murphy gives 130, Twiss 125, Ingles 140.

act may be said to have consummated the degradation of Spain; and her vicious institutions have prevented her recovering, down even to the present hour, from the wounds inflicted by the bigotry and stupidity of her rulers. (*Watson's Philip III.* lib. 4, &c.)

GRANADA (NEW). See COLOMBIA.

GRANAR, an inland town of Ireland, co. Longford, prov. Leinster, 13 m. W. by N. Longford. Pop. in 1851, 2,058; pop. of par. in 1854, 9,798, of which 535 were of the estab. church, 21 Prot. diss., and 9,142 Rom. Cath. It consists of one town and has in it the par. church, a Rom. Cath. chapel, a market-house, and dispensary. Adjoining this town is a remarkable rath or mound, called the Moat of Granard, which commands extensive views of the surrounding country. Markets, well supplied with agricultural produce, are held on Mondays, and fairs on May 3, and Oct. 1. Petty Sessions on Thursdays. It is a constabulary station. Post-office revenue, in 1830, 384.; in 1836, 492.

GRANGEMOUTH, a sea-port town of Scotland, co. Stirling, par. Falkirk, at the E. extremity of the Forth and Clyde Canal, at a point where this line of communication unites with the small river Carron, 4 m. from the Frith of Forth, 11 m. S.E. Stirling, and 18 W. by N. Edinburgh. Pop. 1750. It is substantially built: public buildings, the custom-house, and a large Presbyterian church, in connection with the Kirk of Scotland. Grangemouth has spacious warehouses, commodious quays for shipping, and a dry dock. The Carron Iron Company, distant 2 m. inland, has a wharf here for its vessels, varying from 15 to 20 in number. The place may, indeed, be regarded as the emporium of the trade, not only of Carron, Falkirk, and other places in its vicinity, but of Stirlingshire, as it possesses the best harbour in the county, though no vessels drawing above 12 ft. water can with ease or safety approach it. The chief exports are iron goods, grain, and wool; but the manufacturers of Stirling, St. Ninians, &c., also, send their goods by land carriage to be exported at Grangemouth. The chief article of foreign import is timber; and ship-building is carried on to a considerable extent. Timber imported for Stirling, and even sometimes for Leith, is landed here, and conveyed to its final destination by means of rafts. The custom-house of Grangemouth, established in 1810, includes the subsidiary port of Alloa, on the opposite side of the Forth. Gross customs' duties in 1839, 38,240*l*.

Grangemouth was founded in 1771, in connection with the Forth and Clyde canal, and has long superseeded Airth, which had previously been the chief sea-port of Stirlingshire. The inhabitants are all employed in connection with the trade of the place or the canal, except a few who engage in fishing. Kinnaird House, the seat of the late Mr. Bruce, the celebrated Abyssinian traveller, is in the neighbourhood, and Kerse House, an elegant seat of the Earl of Zetland, is within 4 m. of Grangemouth. (*Nimmo's Hist. of Stirlingshire*, 2 ed., p. 610; *Acenae. Tabl.*) GRANTHAM, a par. bor., market town, and par. of England, co. Lincoln, soke Grantham, on the Wilham, 99 m. N. by W. London, and 22 m. S. Lincoln. Area of par., including Harrowby, Spittlegate, Houghton, and Walton townships, 4,320 acres. Area of old bor., 130 acres. Pop. of par., 1831, 7,427; ditto of bor., 4,495. The town, consisting chiefly of four streets, is neat, clean, and well lighted, but not remarkable for its buildings, and is wholly situated on the W. bank of the river. An increase of buildings has taken place and is still going on, principally in the Spittlegate end of the town. The church, a fine specimen of the Gothic style of the 13th century, has an elegant spire 270 ft. high, and in the interior an elaborately carved font, and some splendid monuments: in the vestry is a public library, left by Dr. Newcombe, master of St. John's Coll., Cambridge. The living, a vicarage, is divided, and is in the gift of two prebends of Salisbury Cathedral. The guildhall was rebuilt in 1787, with the addition of a spacious assembly-room. The grammar-school, at which Sir Isaac Newton was partly educated, was founded and endowed by Henry VIII. and his son Edward VI., out of the spoils of a monastery of grey friars in the town. The rents, in 1833, am. untied to 749*l*., of which 360*l*. went in salaries to three masters, and 330*l*. in exhibitions to the university of Cambridge.

"Grantham is not a manufacturing town; but it is said to be flourishing, and its trade to be increasing. The principal trade is that of malting, which is carried on to a great extent. There is a canal, uniting the town with the Trent, by means of which an extensive export of corn and other agricultural produce takes place, and an import, principally of coal, with which the neighbouring towns to a considerable distance are supplied." (*Mun. Bound. Rep.*)

This bor., which was formerly ruled by 2 aldermen, 13 com. burgesses, and 12 second burgesses, according to a charter granted in the 7th of Charles I., is now under 4 aldermen and 13 burgesses. Grantham has returned 2 mem. to the H. of C. since the 7th of Edward I. Previously to the Reform Act, the par. bor. was identical with the old bor.; the right of voting was vested in free-

men not receiving alms, and the average number of electors for 30 years before 1831, was 864. The Boundary Act extended the limits of the par. bor., so as to make it include the whole par. Registered electors, in 1838-39, 678. Markets on Saturday, and fairs for sheep and cattle, 5th Monday in Lent, Ascension Day, July 10, Oct. 26., and Dec. 17.

Grantham is situated on the old Roman road called Ermine Street, and was a strong Roman station. At the time of the Norman survey it was a royal demesne. It was first incorporated by Edward IV. in 1463, and received, in addition, 12 charters of later date.

GRANVILLE (an. *Grammonum*), a fortified sea-port town of France, dép. Manche, cap. cant., built on and adjoining to a steep rocky promontory projecting into the English Channel 30 m. S.W. St. Lo, and the same distance S. E. Jersey; lat. 48° 50' 16" N., long. 1° 35' 57" W. Pop. (1836) 7,841. It is the only fortified town on the coast between Cherbourg and St. Malo; it is encircled by strong walls, which shut the city off from a suburb on the E. and S.E.; and though irregularly laid out with precipitous and narrow streets, contains many venerable edifices, among which is a Gothic par. church. It has an hospital, and some good baths. The port, on the S. side of the town, is spacious and secure, being defended W. and S.W. by a large and handsome granite pier lately finished, which has cost 2,500,000 francs. The harbour is partially dry at low water; but a wet dock is about to be constructed, for which purpose 3 millions of francs are expected to be voted in the next session of the chamber of deputies. Granville is the seat of a tribunal of commerce, and of a school of navigation; and the residence of a commissary of marine. Its chief trade is in the coal and oyster fisheries. The latter of these is the chief support of the lower classes, and employs about 800 hands: in 1839, about 90 boats, of about 12 tons each, were engaged in it, and the oysters sold that year were 50 millions, the average price being 7 fr. 85 cent. per 1,000. In the fisheries of Newfoundland about 70 vessels, of 100 to 350 tons each, are employed, with about 3,000 men; and the capital embarked is 5,000,000 francs; besides which, about 15 vessels are engaged in supplying the French colonies with salt fish. Thirteen vessels are employed in trading with the E. and W. Indies, of the burden of 4,100 tons. About 33 smaller vessels are employed in the coasting and channel island trade. The total burden of the shipping of this port amounts to 22,000 tons. Eggs are largely exported from Granville to London. It may be mentioned, in opposition to the prevalent notion of the low rate of wages in France, that the daily wages paid in this town are, cutlers, 3*l*. to 3*l*. 2*l*.; masons, 2*l*. to 2*l*. 3*l*.; labourers, 1*l*. to 2*l*.; carpenters, 2*l*. to 3*l*.; joiners, 2*l*. to 2*l*. 3*l*.; ropemakers, 1*l*. to 2*l*.; caulkers, 2*l*. to 2*l*. 3*l*. Granville was bombarded and burned by the English in 1693; and was partly destroyed by the Vendean troops in 1793. (*Mag. Private Information*.)

GRASSE, town of France, dép. Alpes, cap. arrond., on the S. declivity of a hill facing the Mediterranean, from which it is about 7 m. distant, and 23 m. N.E. Draguignan. Pop. (1836) 7,515. Its situation and appearance are highly picturesque; from the S. it rises in successive terraces of white houses, having at its summit the principal church, and a large Gothic tower, the only remnant of the walls by which it was surrounded in the middle ages. It commands extensive and beautiful prospects, and enjoys a healthy climate; though the heat in summer is oppressive. The buildings of the town are generally good; but the streets are steep, narrow, crooked, and dirty: it has, however, a large open market-place, clean, and surrounded by good shops; and at its W. extremity, is a fine public promenade. The town is extremely well furnished with water by a rivulet which rises above it; and which supplies not only the public fountain, and two considerable fountains, but turns a mill, and supplies various factories. The principal church is a large but low heavy Gothic building; it has a curious crypt cut out of the rock, a marble altar, and some good paintings. There are 3 hospitals, in the chapel of one of which are 3 paintings by Rubens; a town hall, exchange, theatre, communal college, public library with 5,000 vols., gallery of paintings, &c. Some Roman antiquities exist here; particularly a small edifice about 30 feet in diameter, formerly used as a chapel, but supposed to have been originally a temple of Jupiter. Grasse is the seat of a sub-prefecture, and of tribunals of original jurisdiction and commerce. It is noted for its manufactures of perfumery, and has a large trade in that article, which dates from about the middle of the last century. Great quantities of orange-flower water and essences of various kinds are distilled; and extensive purchases of Italian perfumery are made by the inhabitants, who also buy up the flowers of the principality of Monaco, and the co. of Nice, and the oil of their own arrondissement (*Grasse des Voyages*). In the latter article, as well as fruits, Grasse has an active trade; it

has also manufactures of coarse woollen stuffs, organized silk, linen thread, leather, soap, liquours, and brandy. Fine marble and alabaster are found in its neighbourhood. The present town is said to have originated in 582, from a colony of Sardinian Jews, who had embraced Christianity. In the succeeding ages, the adjacent coasts being frequently ravaged by the Saracens, Grasse received great accessions to its population in emigrants from Frejus and Antibes. (See *Guide du Voyageur*; Hugo, art. *Var*, &c.)

GRATZ (Slav. *Niemetcki Gradets*, "the mountain fortress of Niemetzki"), a city of the Austrian empire, cap. Styria, near the centre of which it is situated, on both sides the Mur, a tributary of the Drave, 82 m. N.E. Laybach, 86 m. N.W. W. Agram, and 69 m. S.W. Vienna. Lat. 47° 49' N.; long. 15° 26' E. Pop. (1834) 39,772. Grätz is, next to Vienna, Prague, and Trieste, the largest, most populous, and most important city of the German portion of the Austrian empire. It stands in the N. part of an oblong plain, and consists of the city proper on the E. bank of the Mur; and 4 extensive suburbs, the Murstadt on the W. bank of the river, connected with the opposite side by two bridges, and three others. The ancient fortifications were finally levelled by the French in 1809. A great bluff lump of rock, which rises to the height of 300 ft. at the N. extremity of, or rather within the city itself, and whereon once stood the citadel, serves now on an occasional promenade for the inhabitants, thence to survey the singular beauty of the surrounding scenery. After Salzburg and Innsbruck, Grätz boasts of a more picturesque situation than any other city in the Austrian dominions. "All around its plain, through which the Mur, a large and rapid river, flows amidst fields of corn and rural hamlets, rises an amphitheatre of hills, none very high, but finely diversified in form, green, and wooded; and beyond these again are beheld, towards the N. and W., the lofty mountain masses of Upper Styria and Carinthia, rising in rugged grandeur, and for the greater portion of the year covered with snow." (*Turnbull's Austria*, l. 364.)

Grätz, with its suburbs, is about 14 German, or nearly 7 English m. in circ.; but the city itself forms but a very small part of the whole, being only 920 fathoms in length by 400 in breadth, and containing about 30 streets and open spaces, with little more than 400 houses. "The interior is like that of most ancient towns. The streets are generally narrow and dark, opening occasionally into large irregular places. The shops are tolerable; the houses of the higher classes, all of stone, are spacious and gloomy, and such is the character also of the churches, many of which are richly decorated within. The rarity of carriages in the streets in the summer period when we were there, gave them a certain air of dullness in the estimation of persons lately arrived from Pesth and Vienna; but still in most of them might be seen on foot a dense and active population." (*Turnbull*, p. 264.) The inner city, like that of Vienna, is surrounded by high ramparts, now of no use as fortifications, and is entered by 6 gates. The ramparts, together with the glacis or esplanade beyond them, form the favourite walks of the inhab. The esplanade is planted with cheenut trees, and is well kept. The city and its suburbs generally are tolerably well built, and contain many good private as well as some fine public edifices; but the thoroughfares, especially in the inner town, are mostly ill-paved and ill-drained.

Grätz has 32 churches and chapels. The cathedral, or church of St. Egid, a Gothic edifice built in 1456, contains many handsome marble monuments. Near it is a chapel in the Italian style, containing the mausoleum of Ferdinand II., a native of Grätz. Opposite this edifice is the *Convict*; the largest building in Grätz, formerly a Jesuit's college, now a public school belonging to the university. The latter institution, founded by Charles Francis duke of Styria in 1586, was closed by Joseph II. and re-opened by the emperor Francis in 1827. It is one of the second order, having faculties of theology, law, and philosophy. In medicine lectures are given, but no degrees are conferred. The library, according to *Turnbull*, comprises about 40,000 vols., 2,000 MSS. and several literary curiosities. It is kept partly in some smaller rooms, but principally in a lofty, spacious, and elegant saloon, which, at the period when the university was under the direction of the Jesuits, was not unfrequently used as a theatre, for the performance of "Mysteries." The ordinary students attending the university exceed 300. The *Burg*, or ancient palace of the Styrian dukes, now the residence of the governor; the par. church, with the highest tower in the town, and an altar-piece by Tintoretto; the *Landhaus*, a very ancient edifice, in which the estates or parl. of Styria meet, and in which the ducal hat of Styria is preserved; the new council-house, built in 1807; the theatre; and the palaces of various

noblemen, are the other principal buildings. One wing of the Landhaus is called the "arsenal," and is filled with many thousand suits of rusty armour.

But the pride of Grätz and of Styria is the *Johanneum*, one of the most valuable establishments of the kind in Europe. It owes its origin to the peasant archduke John, whence its name; by whom it was founded in 1811, and who has presented to it the whole of his extensive collections in art and science. Its object is the encouragement of the arts and manufactures of Styria, by means of collections, lectures, and a public library. The museum of natural history occupies 13 rooms, some very spacious. The departments of mineralogy and zoology have very complete collections of the minerals and animals of Styria, and the botanical department contains a *herbarium* of more than 15,000 plants. There are collections of the manufactured articles of Styria, and of the agricultural and mechanical implements used in the duchy; besides which, are specimens or models of the principal instruments and machines of all kinds adopted for similar purposes in foreign countries. One room is devoted to antiquities, comprising many Roman, Styrian, and other coins, and Persian, Babylonian, and other antiquities. Near this room is a fire-proof apartment for the custody of records, containing, among other documents, several charters of the 9th and 10th centuries, especially one of 878 by the Capuchin monks, and an extensive botanic garden is now attached to the building. The salaries of the eminent professors, who give lectures on mineralogy, geology, botany, chemistry, agriculture, and the useful arts, are defrayed by the *Stände*, or provincial parliament, the students attending *gratis*. The library, which is open to the public at large, comprises the best standard works of all countries. There is another reading-room and library attached to the *Johanneum*, to which strangers are admitted gratuitously, and natives on payment of about 2s. 6d. a month. It receives newspapers and periodical publications from all parts of Germany, Italy, France, and Great Britain; in all, more than a hundred journals.

Besides the foregoing educational establishments, Grätz has a gymnasium, episcopal academy, military school, a school for teachers, female seminaries, a school kept by Ursuline nuns, schools of music, dancing, oratory, the fine arts, &c., and many Sunday-schools, and others for the instruction of the poor. There are five convents and two monasteries. The splendid abbey, built by Ferdinand II. for the Capuchin monks, and intended to commemorate the fact of his burning 30,000 Protestant bibles by the hands of the common hangman, was converted, by Joseph II., to the more appropriate purpose of a mad-house! Grätz has six hospitals, besides others belonging to some of the monastic establishments, a founding hospital, orphan and deaf and dumb asylum, and various other benevolent institutions; a provincial gaol, workhouse, some military magazines, a society for the furtherance of agriculture, other learned associations, and several collections of paintings. It is the seat of the highest civil authorities for the duchy of Styria, of the military commandant for Styria, Illyria, and the Tyrol; the prov. parl. of the duchy; the council for the circle of Grätz; and the residence of the prince-bishop of Seckau. Its principal manufactures are cotton, silk, and woollen fabrics, leather, iron wire, nails, and other metallic goods; it has, however, others of starch, hats, rosoglio, paper, and earthenware. Its trade in timber, iron, clover-seed, and the other products of Styria, with Hungary, Croatia, Transylvania, and Turkey, is considerable; and it has a large share of the transit trade between Vienna and Trieste. It has two large fairs yearly. The Mur, though it often greatly injures the city and its vicinity by its inundations, renders the latter very fertile. Grätz is well supplied with all kinds of provisions, and is one of the cheapest towns in the Austrian dominions; many of its inhab. are retired officers of the army, and persons of rank but with limited means. As early as the ninth century, Grätz was a town of some consideration; in 1127 it became the residence of the dukes of Styria. It was taken by the French in 1809, after a siege of seven days. After the revolution of 1830, it was for a while the residence of Charles X., and the exiled royal family of France. (*Oesterr. Nat. Encyc.*; *Berghaus*, *Allg. Länder*, &c.; *Turnbull's Austria*; *Murray's Handbook*, &c.)

GRAUDENZ (Slav. *Gradzadz*), a town of the kingd. and prov. Prussia, gov. Marienwerder, cap. circ. same name, on the Vistula, which is here crossed by a bridge of boats, 60 m. S. by E. Danzig. Pop. (1868) 5,918. It is walled, and has a farther defender by a strong fortress erected on the Vistula in 1776. It has 3 suburbs, 5 R. Cath. churches, a Lutheran church, 3 superior schools, a teacher's seminary, house of correction for West Prussia, with which an establishment for the treatment of juvenile felons is connected, circle council, board of taxation, judicial court of the first class for the district and town, and manufactures of tobacco, wheeled vehicles, &c., with extensive breweries, and some trade in corn and woollen cloth. (*Berghaus*; *Stein*, &c.)

* *Convict* and *Stein* say 100,000, and the former gives the same number of vols. to the *Johanneum* library.

GRAVESEND, a bor., market town, sea-port, and par. of Kent, co. Kent, hund. Toltlingtough, on the S. bank of the Thames, 20 m. E. by S. London, and 23 m. W. by N. Canterbury. Area of par., 630 acres; ditto of bor., including Milton par., 1,380 acres. Pop. of par., 1811, 3,119; 1831, 3,814; 1851, 5,097. That part of the town which adjoins the river has steep, narrow, inconvenient, dirty-looking streets; but the upper and more recent part is built in better taste, with wide streets, neat and cheerful residences, and pretty gardens. The principal edifices are the old church, built of brick, in 1730 (the living, a rectory in the gift of the crown), a chapel of ease on the London road, in the modern Gothic style, several dissenters' places of worship; a town-hall and market-place, handsomely built, but pent up amid mean and dirty houses; a custom-house, and a small theatre. A battery lies to the E. of the town, nearly facing Tilbury Fort, on the Essex shore. Two or three hotels, lately built, are amongst the handsomest buildings in the place. W. of the town, on the river bank, are some baths, beautifully as well as commodiously constructed, and forming a highly ornamental feature from the water. The pier, which is of iron, is a modern erection, built by the corporation, and bringing in a large income (7,000*l.* in 1836) by the tolls levied on the visitors and others landing there. Another pier, or jetty of wood, has been erected 300 yards E. of the former, by parties opposed in interest to the corporation: both are extensive proprietors of steam-boats plying between London and this place. Nearly 4 m. S. of the river is a suburb, called Windmill Hill, with a handsome inn, tea gardens, and archery grounds: from the summit is a fine view of the river and surrounding parts of Kent. The village of Milton is chiefly known by its picturesque church, nearly 1 m. E. from the town. Not far off, lying 1 m. W. is its favourite place of resort for those who dislike the bustle of Gravesend. The fixed pop. (1,600) consists principally of ship-carpenters, bargemen, watermen, and people employed in the chalk-works.

Gravesend some years ago placed its main dependence on the trade brought to it by ships wanting supplies of various kinds, and by captains and passengers passing through and staying in the town: since the establishment of steam-boats, however, and the erection of the pier, it has been rapidly increasing in size and importance, the cheap and speedy communication having rendered it a place much resorted to in summer by the middle classes, many of which have houses here, to which they come daily or weekly at the close of business. The crowds of visitors on Sunday, in fine weather, are extremely great. Much of the land about the town is occupied by market gardeners, who raise vegetables for the London market.

Gravesend, which was incorporated with Milton in the reign of Elizabeth, was, before the Mun. Reform Act, under the local jurisdiction of a mayor, 12 jurats, and 24 common councillors, with a recorder, and other officers. By that act the bor. was enlarged, by the addition of a part of Northfleet parish, and divided into two wards, governed by six aldermen (one of whom is mayor) and 18 councillors. It is one of the polling places for W. Kent. Markets, Wednesdays and Saturdays. Fairs, May 4, and Oct. 24.

This town is called *Grævesham* in Domesday Book, and its later name was *Greve*—and supposed to be derived from the Saxon *gerfe*, or German *greve*, ruler, and *ende*, boundary, because the town was the limit of the ancient portreeve's authority. The high balliff was called the portreeve in the 14th century. In the time of Richard II. the town was burnt by the French, and many of the inhab. carried into captivity. In the same reign the watermen of Gravesend obtained the exclusive right of conveying passengers to London, which right is still acknowledged by a yearly compensation from the steam-packet companies. The town was first defended towards the river in the reign of Henry VIII., when Tilbury Fort was erected.

GRAVINA, a town of S. Italy, kingd. Naples, prov. Bari, on a river of the same name, 33½ m. S.W. Bari. Pop. 9,000. It is a bishop's see, has a cathedral, and eight other churches, several convents, and a college. Two large fairs are held annually. It was formerly a place of some strength, having been unsuccessfully besieged by the Saracens in 876.

GRAY, a town of France, dép. Haute-Saône, cap. arrond., on the declivity of a hill on the Saône, 28 m. S.W. Vesoul. Pop. (1836) 5,513. It has a fine quay, and a handsome bridge across the Saône; but its streets are narrow, crooked, and steep. It is well furnished with public fountains; has an ancient residence of the dukes of Burgundy, cavalry barracks, a town-hall, built in 1608, an exchange, par. church, communal college, public library with 4,000 vols., and a remarkable water-mill serving various purposes. Gray has an extensive trade, being an entrepôt for the produce of the S. destined for the E. of France. It has 4 large annual fairs. (*Hugo art. Haute-Saône*, &c.)

GREECE, a country of Europe, the most celebrated of antiquity, and the favoured seat of art, science, and literature, where the greater part of this continent was involved in barbarism. In its flourishing period it comprised the S. portion of the great E. peninsula of Europe, and extended N. to about lat. 42°, including Thessaly, and a part of modern Albania, with the Ionian Islands, Crete, and the islands of the Archipelago. *Hæc cuncta Græcia, quæ fama, quæ gloria, quæ doctrina, quæ plurima artibus, quæ etiam imperio et bellicâ laude floruit, parvum quendam locum Europæ tenet, semperque tenuit.* (*Cicero pro Flacco*, § 21.) This famous region was originally called Hellas ('Ελλάς), and received the name of Greece from *Græcus*, a Thessalian prince. (*Phin. Hist. Nat.*, lib. iv. § 7.) The modern kingdom of Greece, though less extensive than the country anciently so called, comprises the territories of all the most celebrated and interesting of the Grecian states. It includes that portion of the continent S. of the gulphs of Arta and Volo, and an imaginary line drawn between them nearly due E. and W., with the island of Eubœa, the Cyclades, and the N. and W. Sporades. These dominions lie between lat. 36° 16' and 39° 34' N., and long. 20° 43' 30" and 26° 28' E.; the continental portion having N. the Turkish pachaies of Trikala (Thessaly), and Albania (Epirus), and being surrounded every where else by the Mediterranean, denominated on the W. the Ionian Sea; and on the E. the Ægean or Levant. Total area, about 15,000 sq. m. Pop. probably about 900,000.

Continental Greece is naturally divided into two principal portions: the northern, or Hælia, comprising what has been called E. and W. Greece; and the southern, comprising the Morea, an. *Peloponnesus*.

In 1833 the whole country was divided into 10 nomarchies, 5 of which were situated in the Morea, 3 in Hælia, and 2 were made up of the islands. These nomarchies were subdivided into 54 eparchies, and 468 *demoi* or communes. The names of the nomarchies are given in the following table, and their pop. in 1835, according to a statement in the *Journal des Travaux Statistiques* for 1836 and 1837. We have, however, but little confidence in this statement; and, supposing it to have been nearly correct at the time, the pop. is known to have rapidly increased in the interval by immigrations from the surrounding countries, and otherwise:—

Nomes.	Pop. 1835.	Chief Towns.
Hellas:—		
Attica and Boeotia	74,559	Athens, Egina.
Locris and Phocis	45,747	Milœus.
Acarnania and Etolia	65,000	Missolonghi.
Morea:—		
Argolis and Corinth	80,540	Nauplia, Hydra.
Argolis and Peloponnesus	85,979	Patras.
Arcadia	80,871	Tripolizza.
Messenia	61,451	Modon, Navarino.
Laconia	60,530	Mistra.
Islands:—		
Eubœa and N. Sporades	41,525	Chalcis.
Cyclades	105,134	Hermopolis.
Total	688,626	

Physical Geography.—Greece possesses, in a high degree, those geographical features which distinguish Europe at large. No country is more remarkable for the irregularity of its shape, its shores, and its surface. Its N. portion, Hellas, stretches W.N.W. to E.S.E. for about 200 m., gradually decreasing in breadth from Acarnania to Cape Colonna in Attica. Its S. portion, the Morea, is a peninsula, said to derive its modern name from its supposed resemblance to a mulberry leaf. Its actual shape, however, is more like that of a vine leaf; it is united N. E. to Hellas by the isthmus of Corinth. The greatest length of the Morea, N. to S., is about 140 m.; its breadth varies from 60 to 135 m.; it comprises about half the area of the newly erected kingdom.

The surface of Greece is so mountainous, that scarcely any room is left for plains. Such of the latter as exist are principally along the sea-shore, or near the mouth of rivers, or else are mere basins, once forming the beds of mountain lakes, enclosed on all sides by mountains, or communicating with each other only by deep and narrow gorges. Such are the plains of Mantinea, Orchomenos, Sympheia, Topolias, or Copais, &c. The most extensive tracts of plain country are in W. Hellas, and on the N.W. and N. shores of the Morea. These are also of course the most productive parts of the country; but other very fertile, though small, plains are scattered through the E. of Greece, as those of Boeotia, E. Phocis, Marathon, and many others, which are still, as anciently, the granaries of the country. The most flourishing cities of antiquity, as Athens, Eleusis, Megara, Corinth, Argos, Sparta, and Thebes, were situated in the mid or on the borders of the plains and others, as Tripolizza, Leonardi, Mistra, Gortum, Patras, Missolonghi, Zeltoun, and Livadia, which, in modern times, have ranked amongst the principal towns in Greece, have been similarly located.

The *Mountains* belong to the Alpine system, being a continuation of the Julian Alps, so remarkable in their whole extent for their numerous grottoes and caverns. The principal chain—that of Pindus—runs N. W. to S. E. through the centre of Hellas, as far as the Isthmus of Corinth. On entering Greece, the Pindus chain is supposed to be nearly 7,700 ft. in height. It sends off on its W. side some ranges through Acarnania and Etolia, and the range of Mount Zagora or Helicon in Boeotia; but its offshoots on this side are of very inferior height. The mountains of Acarnania in general are estimated at only about 1,900 ft. in height; and Mount Paleo Vouma, the summit of Helicon, has only 5,738 ft. of elevation. On the E. side the branches of Pindus are more lofty: Mount Gulona, the highest point in Greece, and near its N. boundary, is 8,239 ft. high; and Katabothra (*Éta*), 7,061 ft. The celebrated Mount Parnassus is a part of the central mountain chain: its principal summit, Liakona, is 8,069 ft. in height. Mount Elates (*Cithæron*) is 4,629 ft.; and in Attica, Parnes, 4,536; Pentelcus, 3,642; and Hymettus (*Trelo-vouhi*), 3,370 ft. high. A mountain chain runs through Eubœa in its whole length nearly parallel to that of Pindus; its highest point, Mount Delphi (*Dirphossus*), near its centre, reaches the elevation of 5,725 ft. A chain passes through the Isthmus, and nearly through the Morea E. to W., giving off lateral branches, which reach quite to the extremities of the four S. promontories of the peninsula. The culminating point in this part of Greece is Mount St. Elias (*Taygetos*), in Malia, 7,900 ft. high. No mountain in Greece reaches the limit of perpetual snow. (*Bruguière, Géographie; Peytier, in Géogr. Journ. viii. part 3; Expédition Scientifique de Morée et d'Alban.*)

Rivers, Lakes, &c.—Greece has no navigable river, nor would any be worth notice, but for the classical recollections which attach to every portion of the soil and waters of this celebrated country. The Aspro-Potamos (*Aschelus*), between Etolia and Acarnania, is the largest; the principal remaining ones are the Gavrios Mavro-Potamos (*Cephissus* of Boeotia), which runs into the lake Topolias, the Hellada (*Sperchius*) Aœopos, the Athenian Cephissus and Ilissus,—in the Morea, the Roupia (*Alpheus*), Vasilico (*Evrotas*), Iliao (*Peneus*), Planiza (*Inachus*), Mavro-Nero (the ancient *Sitys*, &c.). The principal lake is that of Topolias (*Copais*), in W. Boeotia, said by Thierach to be 1,000 ft. above the sea. It is of a very irregular shape, and in winter is sometimes 15 m. long, by 10 m. broad; but its size varies considerably at different periods of the year. In summer, it is reduced to a mere swamp, partly cultivated, and partly covered with reeds, and emitting pestiferous exhalations. It contains several small islands, and has a subterraneous outlet for its waters under Mount Ptoon into the Channel of Talant. There are a few insignificant pools in the Morea, including the Lernean and Stympalian lakes, so famous in classic fable. The former of these "is formed by several clear and copious springs (the veritable heads of the *Hydra*), which rush out of a rock at the foot of a hill. The lake is, however, so diminutive, and so much concealed by reeds and other aquatic plants, that it might easily be passed without attracting the attention of the traveller." (*Dodwell*.) Marshes are numerous. Nearly the whole N. shore of the Morea, from Corinth to Patras, is low and marshy; and the interior of both those towns, as well as of Nafplia, Argos and Zeitoun, the plain of Marathon, and a portion of that of Athens, suffer, at certain seasons of the year, from malaria generated by stagnant pools.

Shores, Gulphs, Capes, &c.—The want of navigable rivers in Greece is obviated by the numerous gulphs and inlets of the sea, which indent its coasts on every side, and afford unusual facilities to commerce, while they add to the variety and beauty of the scenery. The principal gulphs or bays are those of Volo, Zeitoun, Egina, or Athens (*Sinæ*), These, and Argos, Nauplia, on the E.; Kolokythi and Koron on the S.; Arkhadia, Putras, and Arta, on the W.; and the extensive and beautiful Gulph of Corinth, between Hellas and the Morea. Between Eubœa and the main land are the Channels of Talant and Egripo, united by the ancient Eurypus. The shores of Greece are mostly abrupt. The chief headlands are, Capes Mantelo in Eubœa, Colonna (*Sunium*), and Skyllio (*Scyllæum*) on the E.; St. Angelo (*Malea*), Matapan (*Tenarum*), and Gallo (*Acritas Pr.*), on the S.; and Kiarrensia and Skrophos on the W. coasts. (*Leake, Col. Travels in N. Greece and the Morea; Hoffmann's Europa und seine Bewohner, &c.*)

Geology and Minerals.—The central chain of Pindus is composed in great part of primitive rocks, as serpentine, covered with a yellowish green steatite, granite, gneiss, mica, and other schists, &c. Rocks of this kind are also met with in E. Hellas; and they are plentiful in the higher mountain ranges of the Morea and the islands, particularly Mycone and Delos. Slate occurs in the ridge of Éta and several of the mountain-masses of Messenia and Arcadia. By far the greater portion of the country, however, consists of secondary formations.

Greece, generally speaking, is a region of compact grey limestone. This material ascends to a considerable height above the level of the sea, and the chain of Éta, as well as Mount Parnassus and Helicon, is almost entirely composed of it. The calcareous formations are similar in appearance to those of the N. of Ireland; and contain in many places great quantities of silex. The shores of the Morea are bordered by tertiary formations, containing an abundance of fossil shells. Volcanic action is clearly traceable, particularly in some of the islands. The whole of Greece abounds with caverns and fissures, whence sulphureous and other mephitic vapours arise, which were taken advantage of in antiquity, at Delphi and elsewhere, for practicing religious deceptions. There are numerous hot and cold mineral springs, both saline and sulphureous; but few have yet been analysed. In some parts the soil is impregnated with nitre; this is especially the case near Corinth and Kalavritta. Marble is of various colours, red and green in the Morea, and white at Pentelcus in Attica, porphyry, slate, gypsum, zinc, lead, iron, gold, and silver, in small quantities, cobalt, copper, manganese, alum, sulphur, asphaltum, &c., are amongst the principal mineral products; but the quantities of any of them at present obtained are quite insignificant. According to Thierach (l. 374.), the gold, silver, copper, and lead mines of Attica and the islands of Siphnos and Seriphos are far from being exhausted. Iron abounds in Scyros, at Tanarum, and in Eubœa, where, also, as well as in Elis, there are abundant seams of coal. (*Hoffmann's Europa, &c. l. pt. 1.; Clarke and Holland's Travels; Encyc. des Géogr. du Monde.*)

The climate is temperate, and the country is most healthy, except in the low and marshy tracts round the shores and lakes, some of which are very unhealthy. The mean temperature, in a country the surface of which is so uneven, must, of course, vary considerably; but the medium temperature of the year in the plains of N. Greece, may be about 60°, and in those of the S. about 64° 5' Fahr. At Athens the thermometer not unfrequently rises in July above 100° Fahr. Snow falls in the mountains by the middle of Oct., and even in the plains it is occasionally six inches deep; but it never lies long in the latter. The winters at Athens are confined to the two first months of the year. Both spring and autumn are rainy seasons; and in Dec. the rains are generally so heavy that many parts of the country are laid under water; but throughout the whole summer, which may be said to comprise half the year, a shower, or a cloud in the sky, is rare in several parts of the country. The harvest usually takes place in June, but it is nearly a month earlier in Attica than in other parts of Greece. The latter province enjoys the driest atmosphere of any, to which circumstance the better preservation of its splendid specimens of ancient art is mainly owing. Its climate is much more agreeable in every respect than that of some of the other provs., as Boeotia, Arcadia, &c. Violent tempests often occur in autumn, and storms of thunder and lightning in spring; earthquakes are not uncommon. Intermittent fevers, *elephantiasis*, and *lepra*, are amongst the most prevalent diseases; Greece has been occasionally visited by the plague. (*Peytier in Journ. de Travaux, &c.; Leake, Hughes, Lord Byron, Cochrane, &c.*)

The vegetable products are for the most part similar to those of S. Italy. The country may, in this respect, be considered as divided into 4 distinct zones or regions, according to its elevation. The first zone, reaching to 1,500 ft. above the level of the sea, is adapted to the culture of the different kinds of grain, vines, figs, olives, dates, oranges, citrons, melons, pomegranates, and other fruits, cotton, indigo, tobacco, &c., and abounds besides in evergreens, as the cypress, bay, myrtle, arbutus, oleanders, lentisks, &c., with the oriental plane, manna-ash, several kinds of oaks and pines, and a multitude of aromatic herbs. The second zone is the *region of oak and chestnut*; it extends, from 1,500 to 3,500 feet perpendicular, and produces, besides the trees above named, the white fir, several kinds of pine, the manna-ash, &c. The third zone is the *region of beech and pine*; it reaches to the height of 5,600 ft., and contains numerous woods consisting of those trees, interspersed with a few corn-fields. The fourth zone, including all the surface above 5,600 ft. in height, is the *sub-alpine region*, and yields only a few wild plants. Amongst the extracts from Dr. Sibthorp's papers, given in Mr. Walpole's Memoirs, is a very complete list of Grecian plants, with an account of their medicinal and economic uses. A great deal of the surface abounds with aromatic plants peculiarly adapted for the honey-bee; and the *pinus* (the *pinus* of the ancient Greeks), which feeds the cochineal insect, is found of every size, from a low shrub to a large forest tree, both in the plains and on the mountains. Acarnania, Elis, Messenia, and the W. parts of Greece generally, are the most richly wooded; the islands are mostly destitute of wood. (*Hoffmann's Europa und seine Bewohner, li. 61.; Leake, N. Greece and Morea, &c.*)

Animals.—The wolf, jackal, lynx, badger, fox, wild boar, wild goat, red deer, roebuck, moufflon (?) &c., inhabit the wilder and more inaccessible and densely wooded parts of Greece; and bears are sometimes met with on the N. frontier, and in the lofty regions of Arcadia and Maina. Hares are very numerous, and their skins are a considerable article of export from the Morea. The otter inhabits the rivers and marshes of Boeotia; and pboas and porpoises are seen around the coasts, and sometimes in the Corinthian Gulph. The large vulture frequents the cliffs of Delphi, and the woods and precipices of Parnassus. There are several species of the falcon tribe. The little owl (*Strix passerina*), anciently the bird of Minerva, is still as common round Athens as in antiquity. The red-legged partridge, quails, woodcocks, snipes, wood-pigeons, &c., are plentiful; pheasants are to be found in the W. and N.; and large flocks of bustards are often seen in Boeotia. The coasts and lakes abound with wild fowl; storks and many other birds of passage sojourn in Greece. Sturgeons, salmon, mullet, tunny, mackerel, anchovies, &c., and abundance of shell-fish, are caught around the coasts. Large and delicate white eels (often weighing 12 lbs.) are still found, as anciently, in the lake Copais. They are salted, and sent in large quantities to Constantinople, and into the marts of Greece. The coast-fisheries afford employment and subsistence to no inconsiderable number of the population; but their produce is notwithstanding insufficient to supply the demand during the long fasts prescribed by the Greek church, and a good deal of salted fish is imported. Poisonous vipers, and other serpents, infest certain localities; leeches are very plentiful in some of the brooks, which are therefore farmed out by the government as a means of revenue. The insect tribes of Greece include several Asiatic and African as well as European species; especially of the order *Orthoptera*. Wild bees are abundant; clouds of locusts occasionally do great damage to the crops. (*Pouqueville*; *Hughes*; *Leake*; *Cochrane*; *Diet. Geogr.*; *Mod. Trav.*, &c.)

Scenery.—Travellers in Greece generally speak in high terms of its scenery. It has every where the finest views, and is interesting not less from its natural beauties than its classical associations, and the ruins of ancient art and splendour scattered over it.

"Yet are thy skies as blue, thy crags as wild,
Sweet are thy groves, and verdant are thy fields,
Thine olive ripe as when Minerva smiled,
And all his haunted wealth Hymettus yields;
There the blithe bee his fragrant forerunners builds,
The freethorn wanderer of thy mountain air;
Apollo still thy long, long summer glides,
Still in his beam Mendel's marble glares;
Art, Glory, Freedom fall, but Nature still is fair.

"Where'er we tread, 'tis haunted, holy ground;
No earth of thine is lost in vulgar mould;
But one vast realm of wonder spreads around,
And all the Muse's tales seem true'st legends told;
Till the sense aches with gazing to behold
The scenes our earliest dreams have dwelt upon:
Each hill and dale, each deepening glen and wood,
Defies the power that'd thy temples gild;
Age shakes Athos's tower, but spurns gay Marathon."
Childs Harold, canto ii.

The richly-wooded and well-watered provinces of Acarnania and Etolia are succeeded towards the E. by the lofty, rugged, and forest-clad chains of Parnassus and Æta, alternating with the fertile valleys of the Cephissus and Hellada. Boeotia, consisting of two elevated basins, has been uniformly celebrated for its fertility, and was considered the granary of ancient Greece. Athens has been said to surpass all the other capitals of Europe not only in ancient celebrity, but also in the beauty and variety of the surrounding country. It is much to be regretted, that the fine forests which once clothed the hills of Greece have been so extensively ravaged, partly by the wanton rapacity of the inhab., partly by the Turkish troops, who carried fire and sword into the remote fastnesses of the mountains. Still, however, on Parnassus, Helicon, and Taygetus, in Megaris and Arcadia, oak-forests and pines are found of great extent. (*Thierack's Athens and Attica*, &c.)

Distribution of Land, Agriculture, &c.—*Mr. Urquhart (Turkey and its Resources, 1835)*, estimated Hellas (E. and W.) to contain 3,548,200 stremas of arable land, 199,710 str. vineyards, 4,430 str. garden ground, and 854,000 olive trees. He also gave the following statement of the distribution and value of the land in the Morea.

How occupied.	Stremas.	Value per Strema.
Pasture and forest land	6,000,000	Pistres, 8
Open land	6,000,000	50
Irrigated land	500,000	1,000
Current land	1,500	5,000
Vineyards	6,000	1,000
Other plantations	10,000	20
Orchards	30,000	20
Mills	400	5,000

Mr. Cochrane (Wanderings, &c.) supposes the total surface of the country to be about 36,000,000 str. (about 12,000,000 acres); 2-3ds of which, he says, belong to the government, and the rest to individuals; but he adds, that not more than 1-10th part is cultivated. We have since been assured that probably 5-6ths of the land belong to the state and to the church. The average price of farm land is about 50 drachmas (85s.) the strema (nearly 1-3d of an acre.) In some places, the holder of government lands rents it as high as 20 per cent. on its value; but the usual mode of farming is on the *metayer* system, by which the landlord's share of the crop is from 1-3d to half, according to the proportion of stock or implements he furnishes. There is no regular succession of crops; and two years' fallows are common. Hellas is a better corn country than the Morea; and corn is extensively grown in Acarnania, Etolia, and Boeotia: in the last-named prov. there is always a good crop, the soil being continually moist, even though drought prevail throughout the rest of Greece. As many as 6 different species of wheat are grown; returning, it is said, after a dry spring, from 3 to 5, or in a very favourable season, as many as from 10 to 13 for 1. The annual yield of corn, at an average of the principal corn districts of Greece was thus estimated by Colonel Leake a few years back. (*N. Greece, i. 112.*)

District of Thebes	150,000 kilos of 22 okes = 59 2-3 lbs.
Livadia	200,000 do.
Salona	50,000 do.
{ Corinth and Achaea }	100,000 do.
Arcadia	50,000 do.
{ Pyrgo and Gastoun }	150,000 do.—Total 700,000 kilos.

But we must add, that these kind of estimates are generally but little to be depended on, and at best are nothing better than rough guesses.

The wheat of the Morea has long been highly prized in the adjacent islands; the lands on either side the Gulph of Corinth, and in a part of Attica, are favourable to the growth of barley, as well as celebrated for their olives. The culture of oats and rye is unimportant. Maize is grown in Boeotia, and the Morea. Rice is cultivated in the plains of Marathon, Argos, &c., and other marshy tracts along the coasts; and the rice of Argolis is said to be esteemed next after that of Damietta in the markets of Constantinople, to which it is exported from Nauplia. Marathon, though forgotten in almost every other respect, is still celebrated, as before the era of its glory, for being the granary of Athens. The demand for the currant-grape in Great Britain and other N. countries of Europe, has brought it into extensive culture in the Morea; and the S. shore of the Corinthian Gulph from Corinth to Patras is in great part covered with currant-vineyards. The hills of Greece are admirably adapted for the vine (*Vitis vinifera*); yet few vines are grown, except in low situations. The wines of Mistra and Corinth, Elis and Arcadia, the valley of Helicon, the islands of Naxos, Santorin, &c., have a rich and delicate flavour; but they have comparatively little body, and are almost universally ruined (for other European palates), by the addition of resin or turpentine, a practice handed down from the ancients. Most part of the wine used in continental Greece is brought from the islands of the Archipelago, which are rich also in fruits of various kinds. The olive oil of Greece would be good if well prepared; the best is said to be furnished by Attica, Egina, and Maina. Cotton of good quality is grown in Messenia, Laconia, and other parts of the Morea, but especially in the plain of Argos. Madder and tobacco in Boeotia, flax and hemp, figs in Attica (so famous in antiquity), and elsewhere, pomegranates, oranges, lemons, peaches, almonds, and a great variety of shell-fruit, haricots and other pulses; tonatas, cucumbers, artichokes, potatoes, and the pot-herbs common in the rest of Europe, are among the remaining articles of culture. The collecting of gall-nuts and valloona bark, which formerly received a considerable share of attention, has been latterly much neglected; and but little pains are bestowed on mulberry plantations, though the annual export of silk be estimated at 60,000 okes. Large quantities of wax are exported from Nauplia. Honey is a highly important product; that of Attica, and especially of Mt. Hymettus, is now, as of old, the best in Europe. It is hygienic, and has a delicious perfume.

Owing to the long continued insecurity that has existed in the country, and the oppressions practised on the peasantry, agriculture is in the most backward condition. The surface of the soil is either scratched by a plough about 1-4th part the size and weight of an English one, or else, as in Etolia, it is turned up by hoes. Gardens are every where wrought by the latter, the spade (at least at a very recent period) being unknown to the modern Greeks. Except in Laconia, field labour is every where undertaken by males only. The price of labour is very variable: in Attica it varies from 1 to 2½ drachmas (8d. to 1s. 9d.) a day.

The greater part of the surface of Greece being rugged and uneven, it is more a pastoral than an agricultural country; the raising of sheep is an important branch of industry; and the Wallachians have long been accustomed to bring their flocks every year to pasture in N. Greece. Except in Arcadia and Ellis, there are but few horned cattle. In most parts cows' milk is made little use of, and beef is little eaten; oxen and buffaloes are therefore in demand chiefly for the plough. The sheep, except those of the island of Paros, yield coarse wool; they are most frequently kept in flocks of about 500 each, tended by 3 or 4 men, and as many dogs. Goats are very abundant; their flesh and hair are both excellent, and a great deal of cheese is made with their milk. In the time of Strabo, Arcadia was renowned for its horses; those of the present day, in that prov., are not handsome; but they are spirited, vigorous, and sure-footed. As beasts of burden, mules and asses are chiefly employed.

The condition of the peasantry has been materially ameliorated, since Greece became independent. Under the Turks they were obliged to conceal most of their little possessions, to prevent their being seized on. Their habitations, though still rude, have a greater appearance of comfort than formerly; they are usually their own handwork, built of wood, or reeds plastered with mud and broken straw, or of stone if that material be found near the spot, cemented with mud and clay. The food of the labouring classes, for four or five days of the week, consists almost wholly of vegetables. Their principal animal food is goats' flesh; but in some of the more barren parts of the Morea, which produce neither corn nor oil, none but the opulent ever taste animal food, except on high festivals. Abject poverty, however, is not common, and a progressive improvement in the condition of the peasantry appears to be taking place, especially in the islands, where the comforts of life are much better understood than on the continent. (*Thiersch*.) Modern English travellers agree in opinion, that though the labourer be sometimes almost as much oppressed by the Greek proprietors as by the Turks, "he is generally industrious, attached to his family, anxious for the education of his children, and equal, if not superior, in intelligence to the peasantry of many of the more civilised states of Europe." (*Leake, Col., Outline of the Greek Revol. & Trav.; Hughes, Urquhart, Cochran, &c.*)

Manufactures are almost wholly domestic, every peasant's family producing, with few exceptions, the articles required for their consumption. A few silk, cotton, and woollen stuffs, household pottery, some cutlery, leather, and soap, are made in the larger towns, carpets in the Isle of Andros, and sail-cloth and straw hats in that of Siphnos. Goat-skins are prepared for holding wine, oil, and honey; brandy, liqueur, vinegar, merschaum-pipes, and arms may also be mentioned. Saddlery and horse-furniture have deteriorated since the departure of the Turks; and those, as well as most articles of luxury, are now imported from other parts of Europe. The art of dyeing in bright colours, for which the ancient Greeks were so celebrated, has, however, been perpetuated to the present day; and the Greek women excel in embroidery. Salt sufficient for the consumption of the country is produced in the lagoons near Missolonghi and elsewhere. Vessels are built in many places. (*Leake's Outline, &c.; Encycl. des Gens du Monde; Journ. des Travaux.*)

Commerce. In 1831, the value of the imports and exports, specifying the principal articles, was estimated as follows:—

Imports.		Exports.	
Articles.	Value.	Articles.	Value.
Corn	£75,000	Raw Silk	£75,400
Cotton prints	169,350	Currents	27,750
Other cotton goods	108,000	Wool	25,000
Silk fabrics	94,400	Oil	25,000
Woolen do.	46,750	Wines and spirits	18,000
Sugar	39,800	Copper	25,000
Coffee	86,200	Other articles	65,950
Other articles	245,950		
Total value	1,111,980	Total value	369,540

But it is obvious that little or no dependence can be placed on this statement; and that it affords no means of forming any estimate of the trade of the country in ordinary years: there cannot in reality be any such discrepancy between the imports and exports as is here exhibited.

Amongst the exported articles are included salted quail, sent in bags to Constantinople, wax to Leghorn, smalt to Trieste, and in plentiful years two ship-loads of horse-hoofs to Italy. The duties on exports are at an average about 3 per cent. *ad valorem*; but oil and valloon bark are exempted from all duties. Greece is far more adapted by Nature for becoming a mercantile

than an agricultural or manufacturing state. Their commerce, next to their freedom, was the grand source of prosperity of Athens, Corinth, and other Greek cities of antiquity; and the future prosperity of the country will, in all probability, depend to a great extent on its trade. At present there are very few good roads throughout Greece, and merchandise has in most parts to be conveyed by means of horses or mules. Fortunately, however, the numerous bays and inlets of the sea render these less necessary than in most other countries; added to which, within the last few years, several new roads have been made. The mercantile navy of Greece is composed mostly of small craft; but in 1838, it had in all above 4,500 vessels, some of which were of 500 tons burden, manned by about 16,000 hardy and enterprising sailors. The trade with Turkey was fully re-established by the end of 1830; and in the following year it employed 1,107 vessels, of the burden of 186,512 tons. In 1836, 1,175 Greek vessels, large and small, passed the Dardanelles, though in the same year only 31 Russian, 23 Austrian, and the same number of Sardinian vessels went through that strait. Nauplia, Patras, Syra, the Piræus (port of Athens), Corinth, Missolonghi, and Sparta, are the chief commercial ports. Hydra, which was formerly flourishing, and a few years ago possessed 120 trading vessels, of from 150 to 170 tons, has greatly declined, especially since the earthquake of March, 1837, by which the town was mostly laid in ruins. (*Journ. de Travaux Statist., &c.; Encycl. des Gens du Monde, &c.*)

The following is an Account of the Foreign Ships which entered and left the Ports of Greece in 1836.

Nation.	Inward.		Outward.	
	Ships.	Tons.	Ships.	Tons.
British	36	7,955	56	4,787
Austrian	139	17,925	162	10,445
Papal States	8	1,347		
Tuscan	17	2,407	10	1,545
Two Sicilies	11	464		
Malta	14	1,754	17	2,956
Ionian Islands	330	16,398	216	8,211
Turkey	1,694	85,327	1,729	104,845
Russia	13	1,008		
France	55	7,689	31	6,009
Spain	1	1	1	6168
United States	1	205	1	456
Various others	21	3,000	21	2,956
Total	2,919	145,702	2,941	153,376

Weights and Measures.

The weights in use are—

The Oke = 45·3 oz. avoirdupois.

Kilo = 22 okes.

Canter or quintal = 44 okes.

Strema (of load) = nearly 1·5 acre.

Argent = nearly 14 acre.

The Greeks ordinarily reckon distance by the hour: thus they say, "an hour distant," meaning about 5 m. They calculate time by the old style, i. e. 12 days later than we do.

Money.

Gold pieces of 10, 20, 40, and 50 drachmas.

(Other 5 drachma piece = 34. 644.)

Silver { Drachma = 0 84

Half and quarter dr. = 0 84

Basire = 0 32 (Urquhart).

Para, 40 to the piastre, 100 to the

drachma = 0 0 1·3

Asper = 0 0 0·1·3 of a para.

The government is a nearly absolute monarchy, hereditary in the line of Prince Otto of Bavaria, who, as well as his successors, is prohibited accepting the Bavarian or any foreign crown. The administration is in seven departments—those of the royal household and foreign affairs, the interior, religion, and public instruction, justice, finance, war, and maritime affairs. The council of state, appointed to assist the king in his duties, consists of 5 vice-presidents, 17 ordinary, and 14 extraordinary councillors. Of the latter, four are appointed referees, with privileges above the rest. Its functions, however, are purely advisory; the king has power to decree laws without its sanction; but in such cases he bears the sole responsibility of the act. The synod of the clergy, elected annually, consists of a president and 5 members, with 3 secretaries; the government being represented by a state officer called the Procurator. There are 33 bishops of the Greek church in the kingdom; and they elect from themselves 6 synods, composing the above synod. The 4 Rom. Catholic bishops of Naxos, Tinos, Syra, and Santorini, have no political existence. The towns of Greece, from the earliest periods, have enjoyed municipal rights and privileges under different modifications; nor did the foreign rulers interfere much with the patriarchal system by which their society is governed. Even during the Turkish rule, the heads of families in every town, village, and commune, throughout the Morea, chose a *demogeront* or mayor, who took cognisance of all civil judicial matters. No tax could be levied with-

out the concurrence of these *demogeronts*; and they were sometimes called in to assist in council with the *primates*; and the *voukades* appointed by the *pacha*, who jointly superintended the province. (See *Thiersch, Etat actuel de la Grèce*, i. p. 3, sec. 3.) *Maina* was at the same period ruled by its own *capitani*, the chief of whom had the title of *Bey*. N. Greece was governed, with little difference, in the same mode as the *Morea*, till Ali Pacha destroyed its liberties. In the islands the *demogeronts* were entitled *archontes*, and were criminal as well as civil judges. Count Capo d'Istria suspended altogether the municipal rights of the towns, &c., and placed over each eparchy a creature of his government; but on his fall, those individuals were expelled, and the towns and communes every where resumed their privileges, which were confirmed by the crown in 1834. The administration of each *demo* or borough is consequently still exercised by one or more *demogeronts*, assisted by a municipal council. The *demogeronts* are elected annually from amongst the heads of families—one in each commune or rural district, and three in each town. They next assemble in the chief towns of their several eparchies, when three or more are elected to form, in conjunction with the *demogeronts* of that town, the eparchial or provincial council for the ensuing year. The government of each eparchy is administered by an officer named an *eparch*, subordinate to the *nomarch*, whose authority, in the same manner, extends over a *nomarchy*. (See *Parish's Diplomatic Hist. of Greece*, pp. 38-9.)

Justice.—The *Mayors*, aided by the communal tribunals, composed of respectable inhab. of the commune, have authority in cases of petty misdemeanors, and arbitrate, without appeal, in civil transactions to the amount of 20 drachmas. There are eparchial courts presided over by a judge, appointed by the government; and a court of original jurisdiction is established in the chief town of each *nomarchy*, as before the subdivision of the kingdom into 30 governments, an event which appears to have had but little practical influence as to internal arrangements. Formerly there were 3 courts of appeal—at Nauplia, Missolonghi, and Chalcis; but since 1834 their number has been reduced to 2—those of Athens, for Hellas and Eubœa, and Tripolizza for the *Morea*, &c. The decisions of these are subordinate to the authority of the Court of Cassation and criminal court, established in the cap., composed of judges, a state-attorney, and a registrar. Besides these, there are 10 primary tribunals, and 3 commercial courts. There is no regularly organised code of laws, but the decisions of the judges are mostly guided by the Code Napoleon and established customs. Trial by jury, in criminal cases has been introduced, and is said to be becoming pretty generally understood, and to work well. The annual expenses of the judicial branch of the public service amounts to nearly 1,577,590 drachmas. (*Journ. des Travaux; Encyc. des Gens du Monde*.)

Religion.—The great mass of the pop. belong to the Greek church; but since 1833, Greece has been independent of the authority of the Patriarch of Constantinople. The king is titular head of the church, the affairs of which are conducted by a synod composed of 5 bishops, a secretary, and a royal missionary. The Greek priesthood, are, speaking generally, poor, and illiterate. Their habits are, however, said to be simple and exemplary. Monasteries are by no means so numerous as formerly. The national congress, held at Argos in 1829, wisely abolished 820, which contained, at an average, nearly 6 monks each; there are now 82 in all, with a total of 1,500 or 2,000 inmates, besides about 30 convents. There are about 15,000 Rom. Catholics in Greece, including the royal family and suite; some Protestants, and about 4,000 Jews. Full religious toleration is guaranteed by the constitution. (*Stanhope's Constance; Encyc.* &c.)

Public Instruction.—An edict was issued in the early part of King Otto's reign for the establishment of elementary schools in each commune, to which the inhab. should be obliged to send their children from 5 to 12 years of age. This edict has not, however, been fully carried into effect; but in 1833, there were 23 public primary schools existing, and in 1836, about 7,300 children received instruction in the rudimentary branches of education; the boys also in various agricultural occupations, land-measuring, &c.; and the girls in various branches of domestic industry. (*Encyc. des Gens du Monde* (1840), gives 15,000 as the number of children attending elementary schools, but even at this rate, probably not more than 1-8th part of the total number of children are educated. We believe that instruction is more diffused in the islands than in continental Greece. The preparatory schools are supported by the revenues arising from lands formerly belonging to monasteries; their direction is confided to *masters* appointed by government, with salaries of 350 drachmas a month each. The total annual expenditure for state-education is said to be 441,000

drachmas. (*Encyc.*, &c.) There are between 20 and 30 superior schools, principally in the *Morea* and the islands; and in the cap. there is a normal school for teachers established by an American mission. Athens, Corinth, and 3 other towns, have each a *gymnasium*; and in the former city a university, with 23 professors, was established in 1837; to which are attached an observatory, and museums of antiquities, coins, natural history, &c. It has yet, however, only about 50 students. In Athens there are 3 scientific institutions, the medical society, the society of natural history, and a society for promoting education (*Επιστημονικὴ ἑταιρεία*). Greece had, in 1837, fourteen printing-offices; and nine regular newspapers, besides the same number of literary journals, are published in Athens and other places. The printing of books is chiefly confined to educational works. (*Parish; Gifford; Wordsworth; Journal of Education*, 1834-5.)

Armed Force.—Previously to 1838 the army amounted to nearly 10,000 men; but by the new law of conscription the regular army consists of 8,000 men, levied by a conscription of 2,000 in each year. The duration of service is fixed at four years, and all individuals are liable to serve, from the age of 18 to 30, unless those claiming exemption as married men, university students, ecclesiastics, civil servants of the state, only sons, or the guardians of minors. Service by substitute is allowed. The troops consist of 3 battalions of infantry of the line, 2 of light infantry, 4 squadrons of cavalry, a corps of artillery, and another of pioneers. They are chiefly garrisoned at Athens, Argos, Otrinth, and Nauplia; at the last mentioned place is a military school.

Navy.—The prefecture of the Marine at Paros has 10 members. There belong to the fleet 2,400 officers, sailors, and marines, and 190 pieces of cannon mounted in 32 vessels of war. There are 26 captains and about 300 lieutenants and midshipmen, many of whom, however, have the command of merchantmen. The government dockyards are at Paros and Nauplia. There are two orders for military and naval officers and others—"the Order of Merit," and that of "the Holy Saviour."

The *Public Revenue* is derived from rents, taxes on cattle, tithes of the produce of private land, and 25 per cent. of the produce of that belonging to government, and import duties (3,000,000 drachmas annually), leases of mills, salt lagoons, and fisheries, a personal tax, assessed tax on houses, &c. The following is the substance of the official *Statement of the Finances of Greece* for 1833-4-5, published by order of the King of Greece Oct. 1836. (*Parish's Dip. Hist. Greece*, 8vo. 1838.) [See top of next page.]

The receipts for 1833 were estimated at 16,500,000 drachmas, from which 10 per cent. must be deducted for the expenses of collection. Of this sum, the rents of government lands amounted to 6,500,000 dr.; the tax on cattle and customs to 2,000,000 dr. each; stamps, 500,000 dr.; and the tax on salt, 450,000 dr. The expenditure amounted to 22,000,000 dr., of which 6,327,148 dr., or nearly one-third, was for the support of the army, and 2,660,160 dr. for that of the navy. The civil list (independent of the allowance to the king) amounted to 1,000,000 dr. The public debt was then probably not less than 6,500,000. (*Encyc. Monde*.)

People, Manners, &c. The following statements embody the valuable testimony of Thiersch as to the habits and state of the people when he visited Greece in 1831-32:—"There is a pretty marked distinction among the inhab. of the three great divisions of Greece—Greece N. of the Isthmus, the Peloponnesus, and the Islands. The inhabitants of N. Greece have retained a chivalrous and warlike spirit, with a simplicity of manners and mode of life, which strongly remind us of the pictures of the heroic age. The soil here is generally cultivated by Bulgarians, Albanians, and Wallachians. In E. Greece, Parosus, with its natural bulwark, is the only place where the Hellenic race has maintained itself: in the mountainous parts of W. Greece there are also some remnants of Hellenic stock. In these parts the language is spoken with more purity than elsewhere. The pop. of the Peloponnesus consists nearly of the same races as that of N. Greece, but the Peloponnesians are more ignorant and less honest than the inhabitants of Hellas. The Albanians occupy Argolis and a part of the ancient Triphylia. Among the rest of the inhab., who all speak Greek, there are considerable social differences. The pop. of the towns is of a mixed character, as in N. Greece; where there is an active and intelligent body of proprietors, merchants, and artisans in the towns, and among them some of Greek stock. The Mainotes form a separate class of the pop.; they are generally called Mainotes from the name of one of their districts; but their true name, which they have never lost, is Spartans. They occupy the lofty and sterile mountains between the Gulphs of Laconia and Messenia, the representatives of a race driven from the sunny valley of the Eurotas to the bleak and inhospitable tracts of Taygetos, though the plains which are spread out below

them are no longer held by a conqueror, and the fertile lands lie uncultivated for want of labourers. In the islands, there is a singular mixture of Albanians and Greeks. The Albanians of Hydra and Spezzia have long been known as active traders and excellent mariners. The Hydriotes made great sacrifices for the cause of independence in the late war; the Spezzioties, more prudent and calculating, increased their wealth and their merchant navy. The island of Syra, which has long been the centre of an active commerce, now contains the remnant of the pop. of Isparta and Chios. The Ispariotes are an active and handsome race, and skilful seamen; the Chioti, following the habits of their ancestors, are fond of staying at home and attending to their shops and mercantile speculations; they amass wealth, but they employ it in founding establishments of public utility, and in the education of their children. In Tinos, the peasants, who are also the proprietors, cultivate the vine and the fig even amidst the most barren rocks: in Syra, Santorin, and at Naxos, they are the tenants of a miserable race of nobility, whose origin is traced to the time of the crusades, and who still retain the Latin creed of their ancestors. Besides these, there are various bodies of Sulioti, of people from the heights of Olympus. Candioti, many Greek families from Asia Minor, Fanariotes, and others, who have emigrated, or been driven by circumstances within the limits of the new kingdom. The Ispariotes are those who are supposed to have the least intermixture of foreign blood. They have the fine and characteristic Greek physiognomy, as preserved in the marbles of Phidias and other ancient sculptors; they are "ingenious, loquacious, lively to excess, active, enterprising, vapouring, and disputatious." The modern Greeks are generally rather above the middle height, and well shaped; they have the face oval, features regular and expressive, eyes large, dark and animated, eyebrows arched, hair long and dark, and complexions olive-coloured." (*Journal of Education*, xvi.)

The islanders are commonly darker, and of a stronger make than the rest; but the Greeks are all active, hardy, brave, and capable of enduring long privations. Generally speaking, the women of the islands and of Hellas are much handsomer than those of the Morea. The character of the Greeks, while under the Turks, was thus summed up by Mr. Hope. (*Anastasiou*, i. 78-80.) "The complexion of the modern Greek may receive a different cast from different surrounding objects: the core is still the same as in the days of Pericles. Credulity, versatility, and the thirst of distinctions, from the earliest periods formed, still form, and ever will form, the basis of the Greek character. . . . When patriotism, public spirit, and pre-eminence in arts, science, literature, and warfare, were the road to distinction, the Greeks shone the first of patriots, of heroes, of painters, of poets, and of philosophers. Now that craft and subtlety, adulation and intrigue, are the only paths to greatness, the same Greeks are—what you see them!"

The Albanians are of a much more serious and pensive disposition than the Greeks; and it has been remarked that they may be considered to bear the same relation to the latter that the Doric did to the Ionic population in ancient times. The language of the modern Greeks (for the Albanian is of Illyrian origin), is called *Romæic*. It has a greater similarity to the ancient Greek than the Italian to the Latin; but many of the alterations from the ancient tongues which distinguish both the modern languages are analogous. Many

of the popular customs of the Greeks bear the impress of antiquity; various superstitious observances are kept up, and even the ordinary amusements of the people are the same which were popular in ancient times. The far-famed *Romaica*, for instance, the theme of so many travellers, is obviously the same as the Cretan or Dædallian dance; and another modern dance, the *Albanica*, is supposed to resemble the Pyrrhic dance of the ancients.

History.—The Greek nation boasts of the highest antiquity, and in the mythic period of their history it is often impossible to separate fact from fiction. We infer, however, that the Hellenes were not the earliest inhabitants of Hellas, which was previously the abode of the Pelasgi, who migrated not only into Greece, but Italy, and the islands of S. Europe, and there practised tillage and other simple arts of early industry: the remains of Cyclopean walls, scattered in different parts, denote them to have had some knowledge even of architecture. Over these people the Hellenes gradually gained the superiority, and drove them from the continent to the islands, while they peopled it with their own nation, divided into the 4 tribes, of Æolians, Achæans, Ionians, and Dorians, and spreading in different directions over the country, were joined soon afterwards by colonists from Egypt and Phœnicia. The first constitution of Greek cities is beyond the reach of exact history; but it seems that monarchy was the earliest form, and Sicyon is said to have been founded B. C. 2000, Argos, Thebes, Athens, Sparta, and Corinth, claiming an origin not much later. The expedition of Cadmus to Colchis, the siege of Thebes, and the Trojan war (B. C. 1200), are the principal events of the mythic or heroic period. The confusion arising from the last event deprived many kingdoms of their princes, and encouraged the ambition of the Dorian Heraclidæ to get possession of the Peloponnesus, and expel its inhabs. A fresh impulse was thus given to emigration; large bodies of the people crossed the Ægean, and colonised the shores of Asia-Minor; governments changed with their rulers, and the states now partook more of that republican form which was afterwards their characteristic feature.

The civil policy of Sparta and Athens, whose growing power now began to lessen the influence of the other states, was most successful in calling forth the public energies, and in making small means produce great results. The progress of military knowledge and of the more refined arts was contemporaneous with that of politics; most departments of science and of the fine arts, pursued with impatient zeal by the highly sensitive Greeks, were carried by them to a higher pitch of perfection than elsewhere in ancient, and in some respects even than in modern times; and their commerce, conducted by means of their colonies on the Black Sea and on the coasts of Italy, Sicily, and Gaul, was extensive and important. Their pride, activity, and enterprise, and, above all, their love of liberty, bore them triumphant through all the difficulties of the Persian war (closed B. C. 469); and the same features of character, differently developed, involved them in intestine feuds. The Peloponnesian war, which lasted nearly thirty years (B. C. 431-404), by destroying their union, and exhausting their strength, paved the way for their subjugation by Philip of Macedon, who won the decisive battle of Cheronea, B. C. 338. The brilliant conquests of Alexander engaged them for a few years; but their courage was now enervated, and their love of liberty all but extinguished. The Achæan league proved a vain defence against the power of Macedon;

and, when this kingdom fell, Greece was wholly unable to cope with the arms of Rome. The contest was brief, and ended with the capture of Corinth, *anno* 146 *s.c.*, from which time, during 1850 years, it continued to be either really or nominally a portion of the Roman empire. Literature and the arts, long on the decline, were at last destroyed by Justinian, who closed the schools of Athens. Alaric the Goth invaded the country in the year 400, followed by Genseric and Zaber-khan in the 6th and 7th, and by the Normans in the 11th century. After the Latin conquest of Constantinople, in 1304, Greece was parted into feudal principalities, and governed by a variety of Norman, Venetian, and Frankish nobles; but in 1261, with the exception of Athens and Nauplia, it was re-united to the Greek empire by Michael Paleologus. In 1438 it was invaded by the Turks, who finally conquered it in 1481. The Venetians, however, were not disposed to allow its new masters quiet possession, and the country during the 16th and 17th centuries was the theatre of obstinate wars, which continued till the treaty of Passarowitz, in 1718, which confirmed the Turks in their conquest. With the exception of Maina, the whole country remained under their despotism till 1821; when the Greeks once more awoke from their protracted lethargy, and asserted their claim to a national existence, and to the dominion of the land possessed and ennobled by their ancestors. The heads of the nobler families and others interested in the regeneration of their country, formed an *hetairia* for concerting patriotic measures; and, in 1821, Ypsilanti proclaimed that Greece had thrown off the yoke of Turkey. The revolution broke out simultaneously in Greece and Wallachia; and war continued with various success and much bloodshed till the great European powers interfered, and the battle of Navarino (Oct. 30, 1827) insured the independence of Greece, which was reluctantly acknowledged by the Porte in the treaty of Adrianople, in 1829. The provisional government, which had been set on foot during the revolutionary struggle, was agitated by discontents and jealousies, and the president, Count Capo d'Istria, was assassinated in 1831. The allied powers having previously determined on erecting Greece into a monarchy, offered the crown to Prince Leopold of Saxe-Coburg (now king of Belgium), who declined it; finally, it was conferred on Otho, a younger son of the king of Bavaria, who was proclaimed at Nauplia, Aug. 30, 1832.

GREENLAND, an extensive territory forming part of N. America, and partly occupied by Danish colonies, extending N. from Cape Farewell, in lat. $59^{\circ} 49'$ N., between long. 20° and 75° W., having W. Baffin's Bay and Davis' Straits, S. and E. the N. Atlantic Ocean, and N. the unexplored Arctic regions. Pop. estimated at only 6,000 or 7,000, all Esquimaux, except about 150 Europeans. Greenland was long supposed to be united on the N.W. to the continent of America; but the discoveries of recent navigators render it more probable that it is an island. Shape, somewhat triangular with the apex towards the S. It is high and rocky, its surface presenting a chaotic assemblage of sterile mountains, bare or covered with ice, which also occupies a great portion of the intervening valleys. The centre is said to be traversed by a range of lofty mountains, by which the country is divided into E. and W. Greenland. Of the former, from lat. 65° to 69° , little or nothing is known, the shore being constantly beset by vast accumulations of ice. All this coast appears to be colder, more barren and miserable than the W. coast. It may be said to consist of one uninterrupted glacier, exhibiting only a few patches of vegetation, generally on the banks of the rivers; and often advancing far into the sea and forming promontories of ice, large masses of which frequently fall in avalanches. The W. shore is high, rugged, and barren, and rises close to the water's edge into precipitous cliffs and mountains, seen from sea at a distance of 60 m. The whole coast is indented with a series of bays or fjords, interspersed with a number of islands of various form and size. The principal of these is the island of Disco, in the bay of same name, on the W. coast, between lat. 69° and 70° . Only the coasts and islands are yet ascertained to be inhabited, no other part having been explored by Europeans. The air is pure, light, and healthy; but the cold during the long winter is often very intense. More snow falls, and the climate is more severe on the E. than the W. coast. In S. Greenland the cold seldom exceeds 16° or 18° Réaumur, but in the N. the thermometer sometimes stands at 30° Réaumur. The sun has considerable power during the summer, but fine weather is never of long continuance. Lightning sometimes occurs, and hail, but the latter seldom. Violent storms are frequent in autumn. The rare occurrence of rain, and the intense degree of cold produced by the N.E. wind, has given reason to believe that the most E. parts of Greenland form a great archipelago, encumbered with perpetual ice. The aurora borealis has at some seasons a light equal to that of the full moon. The rocks are principally granite, gneiss, clay-slate, porphyry, potstone,

&c., arranged in vertical beds. They have been found to contain a rich copper ore, black lead, marble, asbestos, serpentine, garnets, crystals, and some other valuable stones. There are no volcanoes; but three hot springs have been found in an island on the W. coast. Coals found in the island of Disco. Vegetation, even in the S., is limited to a few stunted birch, elder, and willow trees, moss, lichens, grasses, fungi, &c. Proceeding N. the surface becomes more sterile, and at last nothing is met with except bare rocks. Several kinds of wild berries attain tolerable perfection, and the soil on the W. coast towards the S. has been found fit for the cultivation of various culinary vegetables: the growth of the potato has latterly been attempted with some success. Among the animals are the reindeer in the S., the polar bear in the N., white hares, foxes of various colours, and dogs; seals abound in the S., where the walrus also is met with; whales of various kinds inhabit the seas, chiefly towards the N.; and the sea, fjords, and rivers abound in fish, especially turbot, herrings, salmon-trout, halibuts, rays, &c., with a great variety of shell-fish. Fishing and seal-hunting are the principal occupations of the native inhab.

In 1837 there were in W. Greenland 13 colonies, 15 minor commercial, and 10 missionary establishments. The most N. station is Uppernavik, in lat. $72^{\circ} 30'$. Good Hope, the most recent of the settlements, in lat. $64^{\circ} 10'$, has an excellent harbour. The trade gives employment to about five or six vessels. The exports consist chiefly of whale-oil, seal, bear, and reindeer skins, elder down, &c. The Greenlanders are believed to be of the same race as the inhab. of the coasts of Hudson's Bay, Labrador, and N.W. coasts, Kamtschatka, &c.; from whom they differ little in person, manner, and language. On the W. coast they do not much exceed 5 ft. in height. They have long black hair, small eyes, and a yellow or brown skin. The inhab. of the E. coast differ from the former in being taller, fairer, and more active and robust, but they do not exceed a few hundreds in number. There is no European colony on the E. coast, and little or no intercourse is maintained between it and the W. coast. The inhab. display considerable skill in the structure of their fishing boats and hunting implements, which are made of the drift wood brought in vast quantities to the coast. Many have embraced a species of Christianity; and their superstitious belief in sorcery, &c., is now giving way to a rude kind of civilisation. Their *kajaks* or fishing boats are from 12 to 14 ft. long, and only about $\frac{1}{4}$ ft. broad, sharp at both ends, and covered with skins, except a small round opening in the middle, where the Greenlanders, having a single oar, takes his seat. Their houses are from 6 to 8 ft. high, and vary in size according to the number of families they are intended to accommodate, which sometimes amount to seven or eight. The interior is divided by skins into different compartments; the walls are lined with broom and hung with skins, and the floor paved with flat stones. Their domestic arrangements are simple, and more remarkable for a want of cleanliness than anything else. The food of the natives is principally the dried flesh of the seal, with a little game and fish; coffee, tobacco, snuff, and brandy, are esteemed the greatest luxuries.

Greenland is said to have been discovered by an Icelandic, near the commencement of the 10th century; and the first colonisation of the country, according to the old chronicles, dates from the year 923, when it was settled by the Norwegian Icelanders. It has long been a subject of discussion, whether colonies were established on both coasts; but from the accounts of recent adventurers it is pretty certain that no European colony was ever founded to the E. of Cape Farewell; at all events, no ruins indicative of any ancient settlements have been discovered on that coast, though numerous traces of them remain on the W. coast. Under the Norwegian colonists, the country was governed by Icelandic laws, and had its own bishops. An intercourse was maintained between Norway and these settlements till the end of the 14th or the beginning of the 16th century, when the trade with Greenland was interdicted. Of the subsequent history of the country, and the fate of the colonies, we have no certain account. Several expeditions have from time to time been undertaken for the discovery of the lost colonies, but without success. The first of the modern settlements was established in 1721, under the auspices of the Danish crown, by Hans Egede, a Norwegian, who has written an interesting work on Greenland. (For further particulars, see *Egede's work*; *Malle-Bruns's Geography*; *Cramér's History of Greenland*; *Grahn's Voyage to Greenland*, 1837; *Journal of R. G. Schlegel*, 1831, &c.)

GREENOCK, a parl. bor. and sea-port town of Scotland, co. Renfrew, on the S. bank of the Frith of Clyde, 18 m. W.N.W. Glasgow; lat. $56^{\circ} 57' 2''$ N., long. $4^{\circ} 45' 30''$ W. The situation of Greenock is interesting and picturesque. Immediately behind it the land rises rapidly to a height of 800 ft.; and though the town be built mainly on a strip of level ground stretching up-

wards of 3 m. along the shore, it ascends at one place about 500 yards up the ridge. In its front the Clyde is about 4 m. in width; and its magnificent estuary, which seems land-locked on every side, with the picturesque mountain scenery of Argyll and Dumbarton on the opposite coast, forms a noble view. Crawforddyke, or Cardadyke, on the E., once a rival bor., is now incorporated with Greenock. Pop. (1831) 27,871. The progress of pop. has been, anno 1758, 3,558; 1801, 17,456; 1821, 22,088; 1831, 27,571; and now (1840) it is supposed to be about 30,000.

The town, including several streets begun, but not finished, is upwards of 2 m. in length. The width is inconsiderable, except near its centre, where, as already stated, it stretches up the hill. It is pretty regularly built, particularly in the more modern parts. The leading streets run E. and W. The houses are of stone, covered with slate. The streets which are causewayed, have foot pavements of convenient breadth on both sides. The town is rapidly stretching towards the W., where the best streets have been erected. A number of elegant villas are scattered in this direction, and along the heights behind the town. Greenock, however, is not remarkable for cleanliness, nor is it protected by an efficient police. From its vicinity to the mountains, the climate is moist: the average fall of rain for the three years ending with 1838 being 35.34 inches annually. It is lighted with gas.

Of the public buildings, the most distinguished is the custom-house, erected in 1818 at a cost of 30,000*l*. It is advantageously situated in the centre of the quay, about 40 yards from its edge, and being unconnected with any other building, is opened in all directions. It is in the Grecian style, and its portico fronting the quay is particularly handsome. The other more prominent public buildings are, the town-hall, erected in 1766; the gaol, built in 1810; the infirmary; the Tontine hotel, built in 1801, at an expense of 10,000*l*.; and the exchange buildings, which latter contain under the same roof, or attached to it, the sheriff-court-house, post-office, provident bank, and assembly-rooms. The mansion-house of Greenock, once the residence of the ancient family of Shaw, the superior of the place, is situated on an eminence overhanging the town. Part of the building is old, but additions at different times have been made to it. It is now let to different private families. Greenock contains 3 parishes *quoad civilia*; but 5 chapels of ease, or *quoad sacra* parishes, have been erected since 1233. Of the churches, two only, the Middle Parish church, erected in 1741, and St. Andrew's, built in 1835, are worth any special notice. In addition to the establishments, there are a number of dissenting meeting-houses; of which 3 belong to the Associate Synod; 1 respectively to the Presbyterians, the original Burghers, the Relief, the Independents, Methodists, Roman Catholics, Baptists, and Irvingites, or followers of the late Rev. Edward Irving. There is also a Gaelic chapel for the numerous inhabitants of the Highlands that belong to the town. The stipend of the original or W. parish of Greenock is the largest in Scotland, having increased from about 100*l*. to about 800*l*. a year, a consequence of the glebe being feued, or let on building leases, under an act of parliament passed in 1801.

According to the official returns, Greenock had, in 1838, 26 schools, conducted by 62 teachers, and attended by 2,712 pupils. One only of these seminaries was founded by the magistrates, and is under their management. The others are voluntary institutions. Hence it appears that about a tenth part of the pop. are at school, exclusive of those who attend the occasional courses of lectures delivered in the mechanics' institution, which sometimes has had 800 students. This institution has recently built a hall, which contains an apartment used as a library and reading-room, and a lecture-room. There are 3 other libraries, the largest of which (founded in 1788) belongs to the middle and upper classes, and contains nearly 10,000 volumes. A splendid building for the accommodation of this library has recently been erected at an expense of 3,000*l*., by the present Mr. Watt of Soho, only surviving son of the late James Watt, the improver of the steam-engine, and the most illustrious of the natives of Greenock. A marble statue of Watt, by Chantrey, is placed in this building. The first newspaper published in this town, entitled the *Greenock Advertiser*, was established in 1802. It still survives, and appears twice a week. A second was tried in 1833, but did not long exist. Though the inhabitants are eminently distinguished for education, intelligence, and commercial enterprise, literature, in the strict sense of the term, is not much cherished by them. They have no philosophical associations or literary societies; and the town can boast of no great name except that of Watt. In 1767, when Wilson, the author of *Clyde, a Poem*, was appointed master in the grammar-school of Greenock, the magistrates stipulated with him that he should renounce what they called "the profane and unprofitable art of poem-making!" The charitable and religious institutions of Greenock are numerous

and liberally supported. With regard to pauperism, there were, at an average of three years ending with 1837, 890 paupers on the permanent roll; 904 receiving occasional aid; and 21 lunatic poor: total average number of poor of all kinds, 1,975. The average assessment (which was first introduced in 1817) is 2 39*s*. 7*d*. 1*d*. annually, independent of church collections and other funds; total, 3,100*l*. 9*s*. 10*d*. The highest sum given to the poor on permanent roll is 4*l*. 1*s*.; the lowest, 1*l*. 10*s*. The total sum allowed to the occasional poor annually is 925*l*. 8*s*. 2*d*. or about 8*s*. 4*d*. each. The total sum disbursed for the support of the 21 lunatic poor averages 313*l*. 8*s*. annually, or about 14*l*. 18*s*. 5*d*. each. (*Report of General Assembly on the Poor in Scotland*, 1838, pp. 38, 39.)

An extraordinary work has been constructed at Greenock, by which not only the town is abundantly supplied with water, but machinery to a great extent may be impelled. To accomplish this an artificial lake, covering 254*l* imp. acres, has been excavated in the bosom of the neighbouring alpine district, behind the town, by turning the courses of several small streams into a basin prepared for their reception. From this, as from a common source, an aqueduct or canal is conducted along the mountain range for several miles, at an elevation of 520 ft. above the level of the Clyde; and when within less than a mile of the town, it pours down a torrent in successive falls, the whole length of the aqueduct being 64 m. In addition to the principal basin, there is a compensation reservoir occupying 40 acres, besides several of smaller dimensions, in order to secure a plentiful supply of water in seasons of the greatest drought. A series of self-acting sluices has been constructed in a most ingenious manner, by which all risk of an overflow is obviated, at the same time that every drop of rain, even during the greatest floods, is preserved. This magnificent public work, which has more than realised the expectations of the most sanguine, was planned by Mr. James Thom, of Rothsay; and a company having been formed, it was carried into effect, under his superintendence, in 1827, at an expense of 52,000*l*. The charge to the inhab. for taking the water into their houses is one half per cent. on the rental.

The docks of Greenock deserve particular notice. Sir John Shaw, the feudal superior of the town, having made two unsuccessful applications (in 1686 and 1700) to the Scottish parliament for aid to build a harbour, the inhab. took the matter (1707) into their own hands, and agreed with their superior to assess themselves at a certain rate, to build a proper pier and harbour. The work was finished in 1710, at an expense of 5,555*l*. Greenock being, in the same year, made a custom-house port, and a branch of the neighbouring and then more flourishing bor. of Port Glasgow. A new dock was built in 1785, at a cost of 4,000*l*.; but the accommodation being still very deficient, two spacious wet docks, which cost 119,000*l*., were constructed in 1824. In 1783 the harbour dues amounted to only 11*l*. 4*s*. 8*d*., whereas in 1839 they produced 12,079*l*. 0*s*. 4*d*. The harbour is managed by commissioners, whose expenditure in the above year was 6,099*l*. 17*s*. 8*d*. The existing harbour debt is about 60,000*l*.

The Clyde is navigable to Greenock for vessels of any burden, at any time of the tide; but a sub-marine bank extends from a spot opposite Greenock 9 m. up the river to Dumbarton; and the channel for navigation, though deep, is only 300 ft. wide. The system, often pursued, of towing by steam-boats obviates, in a great measure, this inconvenience. Government has recently agreed to make a survey of the river.

The trade of Greenock has kept pace with the improvements made on its harbour. The union of the kingdoms (1707) opened the colonies to the enterprising inhabitants of this town, and generally of the W. of Scotland; but it was not till 1719 that the first vessel, belonging to Greenock, crossed the Atlantic. The tobacco trade with Virginia and Maryland was prosecuted with great vigour and success for fully half a century after this date; but it was to considerable extent carried on upon account of and in connection with Glasgow merchants. The war with the American colonies depressed, for a lengthened period, the trade of Greenock, but other sources of commerce were gradually taken advantage of; and, at present, ships from this town may be found in almost every considerable port to which British enterprise has extended. The gradual increase of trade may be seen from the following account of the gross receipt of customs' duties at the port of Greenock in various years:—

Years.	Duty.	Years.	Duty.
1788	£2,15,231	1826	£374,467
1770	57,536	1827	396,703
1802	211,087	1838	417,538
1822	385,464		
1833	455,485	1839	515,098

The stationary state of the duties of late years is ascribable to the improvements effected in the navigation of the Clyde, which enable vessels that formerly had to load and unload here, or at Port Glasgow, to ascend to the Broomielaw. (*Vide* GLASGOW.)

The following is an account of the registered vessels belonging to Greenock at various periods:—

Years.	Number of Vessels.	Tonnage.
1825	941	29,059
1830	541	39,698
1835	368	49,802
1838	398	54,739
1839	403	61,528

The number of sailors belonging to the port of Greenock is about 3,200. Most vessels belonging to Glasgow touch at Greenock on entering and leaving the Clyde.

The herring fishery, the trade in which the inhab. of the town first engaged, is still prosecuted to a considerable extent. The Greenland whale-fishery was begun in 1752, but has been long since discontinued. The facilities afforded by the Shaw Water for water-power in manufactures have not been neglected. The works now in operation on the falls are a paper manufactory; a woollen do.; a flax and hemp spinning mill, to which a cordage and sailcloth manufactory is annexed; a mill for cleaning rice and coffee; and two grist mills. A cotton mill of great size, to be driven by a wheel of 70 ft. 2 in. in diameter, is nearly completed; and several of the falls have been taken on lease for various branches of manufacture, but the buildings are not yet begun.

Sugar-refining is carried on here to a greater extent than elsewhere in Scotland. There are three large foundries for the manufacture of steam-engines, chain-cables, anchors, and other ironwork. But the most extensive business pursued in Greenock is that of ship-building. There are 9 building yards, one of which (that of the Messrs. Scott) is one of the largest in the empire. As to the extent of this branch, we may state that, in March 1840, there were on the stocks 4 ships, aggregate burden 1,530 tons; 9 barges, 2,948 tons; 5 brigs, 860 tons; 3 steam-boats, 1,600 tons: total, 21 vessels; aggregate burden, 7,338 tons. Five of the steamers for carrying the royal mail to the W. Indies are to be built in Greenock; and it is to supply six with their machinery. Among the other branches of business may be mentioned several extensive roperies and sailcloth factories, in addition to the one already specified; 4 breweries; 2 tanneries; 2 soap and candle works; the manufacture of straw-hats, and Leghorn bonnets made of rye-straw, the latter having been brought to unusual perfection; of silk and felt hats; pottery; flint-glass; glass bottles; and many others of a minor description. There are six banking establishments, besides a provident bank.

Greenock originally consisted of a few thatched houses stretching along the bay; and the neighbouring hamlet of Cardryke, now incorporated with it, was long a place of greater consideration. It was created a barony in 1635, and Cardryke in 1669. Sir John Shaw, the feudal superior (now represented by Sir Michael Shaw Stewart, bart.) gave power by charter to the feuars, sub-feuars, and burgesses to be afterwards admitted, to meet yearly for the purpose of choosing nine managers of the public funds of the town, viz. 2 bailies a treasurer, and 6 councillors. The united bor. is now governed under the Scotch municipal reform act, by a provost, 4 bailies, and 16 councillors, of which latter, one fills the office of treasurer. Corporate revenue, 1838-39, 19,906*l*. The Reform Act raised Greenock to the dignity of a par. bor., by conferring on it, for the first time, the privilege of sending 1 mem. to the H. of C. Registered voters, in 1839-40, 1,100. In 1835, Greenock and the three neighbouring par. were constituted the Lower Ward of Renfrewshire, and placed under the jurisdiction of a sheriff-substitute, who resides and holds his court in the town.

In addition to the authorities already quoted, *vide Warr's Hist. of Greenock; Crawford's Hist. of Renfrewshire; New Stat. Acc. of Scotland, § Greenock; Boundary Reports; and other Par. Papers*. But the most important parts of this article have been furnished by local authorities.

GREENWICH, a par. bor., town, and par. of England, on the S. bank of the Thames, co. Kent, lathe Sutton-at-Stone, hund. Blackheath, 4*l* m. E.S.E. London; lat. 51° 28' 40", long. 0°. Area of par., 2,680 acres; pop. of ditto (1831), 24,583. It is a thriving town, but without any particular trade or manufacture; the business of the place being derived from its public establishments, from families of fortune residing in or near it, and from the shipping and craft on the river. The streets are in some places narrow and irregular; but within the last few years a new street and many handsome houses have been erected, and the town has been greatly improved. It is

partially paved, well lighted with gas, and supplied with water from the Kent water-works at Deptford. The par. church is a handsome stone fabric, with a noble portico, and an interior richly ornamented in the Corinthian order: the living is a vicarage in the gift of the crown. A new district church, of handsome exterior and Ionic portico, stands near the principal gate of the park.

It appears from Willis's *Notitia Parl.* (vol. iii. p. 85.) that the bor. of Greenwich sent two burgesses to parli. in the reign of Philip and Mary; but neither the extent of the bor., nor the nature of the franchise, nor the reason why it ceased to be exercised, have been specified. The Reform Act again conferred on Greenwich the right to send 2 mems. to the H. of C.; but the parishes of Deptford and Woolwich, and about two thirds of that of Charlton, are included with it in the modern par. bor., which had, in 1831, an aggregate pop. of 65,917. Registered electors, in 1838-39, 3,155.

Greenwich Hospital, the noblest establishment of its kind in Europe, occupies the site of a palace erected by Humphry, Duke of Gloucester, in 1458, and was long the favourite residence of the Tudors. The present building, originally intended for a palace, was commenced by Charles II., who erected one wing at an expense of 35,000*l*. In the reign of William III. the case of the disabled seamen of the navy engaged the attention of the king and queen, and, in consequence, this palace was granted as an asylum for their relief. Commissioners were appointed to carry out the royal intentions; Sir Christopher Wren undertook to superintend the completion of the building without charge, and voluntary contributions were requested in aid of the public grant, which last amounted to 58,209*l*. In 1715, the confiscated estates of the Earl of Derwentwater, amounting to 6,000*l*. a year, were given to it by parli., and their value has immensely increased within the last half century. The hospital was partly also supported by the forced contribution (by act passed 7 & 8 Will. III.) of 6*d*. a month from the wages of all seamen in the king's and merchants' service. But since 1835, merchant seamen have been exempted from this contribution, in lieu of which the sum of 30,000*l*. a year is advanced from the consolidated fund to the hospital. The entire building consists of four magnificent detached quadrangular piles, of Portland stone, called King Charles's, Queen Anne's, King William's, and Queen Mary's: the interval between the two former is the grand square, 273 ft. wide, in the centre of which is a statue of George II., by Rysbrach: the space between the two latter is filled up by two colonnades supported by 300 double columns and pilasters. The principal front, on the N. side towards the river, comprises the sides of King Charles's and Queen Anne's buildings; and before it, extending 465 ft. in length, is a spacious terrace, with a double flight of steps in the middle, commanding a fine view of the building, and forming a handsome landing place to the hospital. King Charles's building, in the N.W. angle, was erected after Inigo Jones's designs: in it are the council-chambers and residences for the governor and lieutenant-governor. Queen Anne's building contains 84 wards for the pensioners, and some officers' apartments. King William's building, designed and directed by Sir C. Wren, contains the great hall, with its vestibule surmounted by a fine cupola, and 11 wards. The hall is 106 ft. long by 56 broad, and 50 high: the roof and walls were painted by Sir James Thornhill, at a cost of 6,685*l*. Several pictures of great naval actions, with portraits and statues of distinguished officers, give interest to this noble apartment. Opposite the hall in Queen Mary's building is the chapel, with a vestibule and cupola corresponding with those of the hall. The roof and inside having been destroyed by fire, were ably restored by "Athenian Stuart," in 1780. A flight of 14 steps leads to the interior, which is 111 ft. long by 52 broad, and accommodates 1,000 persons. The carving of the pulpit and other parts is exquisitely finished. The altar-piece, by West, represents the Shipwreck of St. Paul. This hospital supports about 2,700 old or disabled seamen in the house, and gives pensions varying in amount, but which may average about 12*l*. a year, to a much more numerous body of out-pensioners. The nurses are all seamen's widows. The revenues of the hospital being required for the support of the in-pensioners, the expense of the out-pensioners is defrayed by an annual parliamentary grant. Connected with the hospital, in a building contiguous to the park, part of which was intended for a ranger's lodge, is the Naval Asylum, for the education of 400 boys, 100 of which are sons of commissioned and ward-room warrant officers, and 300 sons of private seamen and marines.

The management of the hospital revenues is vested in 100 incorporated commissioners; and the interior regulations are under the superintendence of a governor, lieutenant-governor, chaplain, and numerous other officers.

Greenwich Park, which was attached to the old palace, and is now in the hands of the crown, contains nearly 200 acres; it is well stocked with timber and deer, and fur-

nishes from its higher part magnificent views of the metropolis and its vicinity. On an eminence 160 ft. above the river, about $\frac{1}{2}$ m. from the park-gates, is the royal observatory, erected by Charles II. for the celebrated Flamsteed, and fitted up with telescopes and other astronomical instruments, which have been successively improved and increased by Graham, Bradley, Hooke, Herschell, Dollond, and others. The upper part of the building consists of rooms well adapted for observations: the lower part being used as the residence of the astronomer royal. This important and honourable situation has been held by some highly distinguished astronomers, as Flamsteed, Halley, Bradley, Blass, Maskelyne, Pond, and Airey, who at present (1840) enjoys that honour. The longitudes of all English charts and maps are reckoned from this observatory; and the captains of ships take their time as given here at 1 p.m. daily. It is $20^{\circ} 30' 10''$ W. from Paris, and $18^{\circ} 9' 45''$ E. from Ferro or Hierro, the most W. of the Canary Islands.

Greenwich has for many years been a favourite resort of holiday-seekers from the metropolis, and the means of access have within a few years been greatly facilitated by steam-boats, and also by a railway terminating in Tooley Street, near London Bridge. The railway company was incorporated in 1835, and the road opened to Deptford in 1836, and to this place in 1838. It is 33 m. long, and is built on a brick viaduct, 22 ft. high, and 34 ft. broad.

Greenwich markets, on Wednesday and Saturday, are well supplied. The fairs, held at Easter and Whitsuntide, are well known, for the various amusements furnished to the crowds that resort thither from all parts of London and its neighbourhood.

GREIFSWALD, a town of the k. of Prussia, prov. Pomerania, cap. circ. of same name, on the Ruck, about 3 m. from the Baltic and 18 m. S. E. Stralsund, Prov. (1836) 10,291. It is the seat of a superior court of appeal, the high judicial tribunal for the territory, formerly Swedish Pomerania (*Nor-Mu-Pommern*), others for the circle and town, a circle-council, high board of customs, consistory, orphan-tribunal, board of agriculture, &c. It has a harbour at the mouth of the Ryck, which is navigable for small vessels; manufactures of salt and tobacco, oil-mills, distilleries, and a brisk trade both by land and sea. A university was founded here in 1456,

	1824.	1835.

Grenada, like most other W. Indian Islands, has its governor, council, and assembly, by whom it is governed. Total military force (1836), 826 privates and 97 officers. No. of public schools in the island in the same year, 8, with 923 scholars. It is divided into 6 par. Its cap., St. George, on a spacious bay on the S. side of the island, is a well-built town, with a pop. of 2,790 (1836), and has one of the safest and most commodious harbours in the British W. Indies. The sum awarded by government, in 1835, for the manumission of slaves in Grenada amounted to 616,444 l. 17s., being about 26s. 4s. per head. This island was discovered by Columbus in 1498, and colonised by the French about 1650, at first as a private speculation, but after 1674 it belonged to the French crown, till taken by the British in 1762. In 1779 it was retaken by the French, but restored to Great Britain at the peace of 1763.

GRENOBLE (an. *Gratiopolis*), a fortified city of France, dép. Isère, of which it is the cap.; on both sides the Isère, 68 m. S. E. Lyons, and 250 m. S. E. Paris; lat. $45^{\circ} 11' 49''$ N., long. $5^{\circ} 44'$ E. Pop. (1836) 26,000. The portion on the left bank of the river (the city, properly so called) is the larger and more ancient: it is surrounded by bastioned ramparts, and has a citadel, but these defences are at present very much out of repair. The portion on the right bank, originally built by the Emperor Gratian, called the Faubourg St. Laurent, is confined between the river and the foot of an abrupt mountain, and consists of little more than one spacious street. It is, however, comparatively the more populous division, and the chief seat of commercial activity. St. Laurent is inclosed by only an indifferent wall, but is defended by the new fortress of Bastille on the mount above it. The two parts of the city are connected by two bridges; one of wood, the other of stone. Grenoble is ill laid out and ill paved; but is generally well built, and clean: many improvements have taken place in it of late years. It contains numerous squares and handsome public fountains; and near its centre is a spacious garden laid out in public walks, planted with trees, and having a quay on the river. Many other agreeable pro-

and some new buildings were erected for it in 1750, but the number of students is inconsiderable. It has cabinets of anatomy and natural objects of various kinds, a library in which there are many MSS. relative to the history of Pomerania, and a botanic garden. It has, besides, a medico-chirurgical school, a gymnasium, and a teacher's seminary. Greifswald was taken by the Elector of Brandenburg in 1768. (*Berghaus; Stein; Dict. Géogr.*)

GREIZ, or GRAITZ, a town of central Germany, cap. princ. of Reuss (elder branch), on the White-Elster, 49 m. S. Leipzig. Pop., in 1837, 6,800. It is a walled town, and is tolerably well built. It is the residence of the sovereign prince, who has a summer palace here, built on an eminence, and surrounded with fine gardens. The church is the only other public building. There are Latin and normal schools; and it has manufactures of coarse woollen cloths, leather, &c., with distilleries. It is the seat of the government, and of a judicial consistory.

GRENADA, one of the W. Indian islands belonging to Great Britain, and the most southerly of the windward group (Tobago and Trinidad excepted), between lat. $11^{\circ} 58'$ and $12^{\circ} 14'$ N., and long. $61^{\circ} 20'$ and $61^{\circ} 35'$ W., about 90 m. N. Trinidad, and 68 m. S. S. W. St. Vincent. Greatest length, 20 m.; greatest breadth, 10 m. Area, about 80,000 acres. Pop. in 1836:

Whites and Free-coloured Races.		Apprenticed Labourers.		Total Population.	
Males.	Females.	Males.	Females.	Males.	Females.
2,029	2,197	8,525	9,490	10,555	11,687

A chain of rather lofty hills runs through the island, in which many small rivers have their sources. There are some small lakes, which appear to occupy the craters of extinct volcanoes. The soil is, on the whole, very fertile, and adapted to every kind of tropical product; but the climate is decidedly unhealthy. About 5-8ths of the surface is cultivated. Indigo, tobacco, sugar, coffee, cocoa, and cotton, thrive well. Game, and birds of numerous species, are very abundant. The chief imports into the U. Kingdom from Grenada, from 1834 to 1838, were —

Arrow-root . . .	4,992	4,100	1,768	4,642	5,360

menades surround the city. The chief public buildings are the cathedral, episcopal palace, hotel of the prefecture, formerly the residence of the celebrated Constable de Lesdiguières, the general hospital, hall of justice, royal college, theatre, and a public library with 60,000 printed vols. and 600 MSS. Here are 4 par. churches, a Protestant church, several convents, and seminaries, a founding and another hospital, a university academy, schools of medicine, drawing, &c., cabinets of natural history and antiquities, and a fine collection of paintings. The Place St. André is a colossal bronze statue of the Chevalier Bayard, the knight "*sans peur, et sans reproche*," who is interred in a contiguous church. Grenoble is the seat of a prefecture, a royal court, and of tribunals of original jurisdiction and commerce. It is the see of a bishop, the cap. of the 7th military division of France; and has a chamber of manufactures, arts, and commerce, faculties of law and sciences, and a Society of Arts, &c. It is noted for its manufacture of kid gloves; and has others of liqueurs, linen fabrics, &c., and some trade in hemp, iron, marble, and timber. It originally bore the name of Cularo, till Gratian enlarged it and gave it his own name. It was long the cap. of Dauphiny. Its inhab. warmly espoused the popular cause against the court of Louis XVI.; and were, afterwards, devoted partisans of Napoleon, in whose favour they made a very vigorous stand against the allies in 1815. (*Hugo, art. Isère; Guide du Voyageur, &c.*)

GREYNA GREEN, a small village of Scotland, parish of Grainsay, co. Dumfries, famous in the annals of gallantry for the celebration of irregular marriages, on the border of England, near the Sark, 9 m. N. W. Carlisle, and 22 m. E. by S. Dumfries. The marriage ceremony merely amounts to an admission before witnesses that certain persons are man and wife; such acknowledgment being sufficient, *provided it be followed or preceded by cohabitation*, according to the law of Scotland, to constitute a valid marriage. A certificate to this effect being signed by the officiating priest (who has never been above the rank

of a tradesman), and by two witnesses, the union, under the above condition, becomes indissoluble. The marriage service of the church of England is sometimes read, in order to please the parties. The marriages of this sort celebrated at Grctna Green are estimated at between 300 and 400 a year; but as similar marriages are celebrated at Springfield, Annan, Coldstream, and other places along the border, their total number is said to amount to 500 a year! The parties are generally from England, and of the lowest ranks; though there are not a few instances of persons of the higher ranks, and even of lord chancellors, having had recourse to the services of the *solicitor* parsons of Grctna Green. A trip to Grctna, or the presence of a self-dubbed parson, is not, however, at all necessary. Parties crossing the Scottish border, and declaring before witnesses that they are man and wife, are, under the previously mentioned conditions, married according to the law of Scotland. This law has been much objected to, but we are inclined to think with no good reason. It would, indeed, be no difficult matter to show, that it is, on the whole, productive of numerous advantages. Not here, perhaps, are there so few rich or improvident marriages as in Scotland, and the retrospective effect of the existing law, or its influence in legitimising the children born before marriage, is, perhaps, its most valuable feature. But it is necessary to observe, that though legitimated in Scotland, children born previously to a Scotch marriage are not legitimated in England, and do not succeed, except by special bequest, to heritable property in that part of the U. Kingdom. In all respects, however, Scotch marriages convey the same rights and privileges in England as English marriages. The practice began at Grctna Green about 90 years ago by a person named Paisley, a tobaccoist, who died so lately as 1814. It is now carried on by various individuals: Indeed each inn has its rival priest, in addition to others who carry on the business on their own account; and so far has competition reduced the fees, that, though large sums (40*l.* or 50*l.*) have been received, the solatium, in some instances, is now so low as half-a-crown. One of these functionaries, who breaks stones daily on the verge of England, has the best chances of succeeding for he accosts every party as they pass, and tries to strike the best bargain. (*New Stat. Account of Scotland, § Dumfries, p. 262.*)

GRIMSBY (GREAT), a parl. bor., market-town, and sea-port of England, co. Lincoln, wap. Bradley-Haverstoe in Lindsey, on the S. side of the estuary of the Humber, 138 m. N. London, 30 m. N.E. Lincoln, and 15 m. S.E. Kingston-on-Hull.

Area and Pop. of Parl. Bor.	Area.	Pop. 1821.	Pop. 1831.
Great Grimsby par. do.	2,110	3,064	4,225

Cleethorpe do.	1,037	406	497
Grimsby parl. bor.	15,400	5,183	6,589

* The municipal bor. includes the par. of Great Grimsby, excepting Wellow, the area of which latter portion is 60 acres, and the pop. 40.

"The town is composed of two portions, with a few houses straggling on the London road: the older part is an irregular cluster of houses at the head of the harbour, a mile or more from the sea; the new part, called the Marsh, having been built since the excavation of the harbour, and consisting of three streets on the E. of and parallel to the harbour, with houses more or less continuous. The distance from the first house in the bor. to the harbour-mouth is about 2 m." (*Boundary Rep.*) "The town, originally consisting of two parishes, which were united in 1586, contains several good streets, lined generally with well built houses. It is tolerably paved, but though lighted a few years ago, it is not so now, in consequence of insufficient funds, and the poverty of the place." (*Mun. Boundary Rep.*) "The church is a large cruciform structure, with a tower, and fine steeple rising from the centre, and is reckoned a good specimen of English pointed architecture. In the interior are some old monuments, that were removed here at the suppression of the monasteries. The Wesleyan and Primitive Methodists, and Baptists have places of worship here. A free grammar-school was founded in 1547, the masters of which are appointed by the corporation. All freemen's children receive their education gratis. There is a small prison, but its arrangements are very defective." (*Mun. Rep.*) "About 3 m. E. of the town are some singular springs, called Blow-wells, the phenomena of which are owing to the great depth of clay (40 ft.) to be cut through before reaching the water.

When wells are dug thus deep, the water instantly rushes to the surface, and continues to flow to that height."

"Grimsby was a port of such importance in the reign of Edward III., as to send 11 ships to the siege of Calais; but its importance in this respect had much declined at the end of the last century, in consequence of the choking up of its harbour; but since then (in 1809) the new harbour, a very splendid work, has been constructed, and a great increase of trade was the result; this increase, however, has not been considerable during the last 10 or 15 years. The roadstead is said to be safe, the holding-ground good, and the shore so soft that a vessel may take the ground without material injury. Vessels drawing 16 ft. may enter this harbour at high water neap tides." (*Mun. and Bound. Rep.*) "There belonged to this port, in 1836, 33 ships of the burden of 1,187 tons; and the gross customs' duties in 1839 amounted to 10,208*l.* The principal foreign trade is with the Baltic. There are 2 mills for grinding bones, and a tannery. Connected with the harbour are large warehouses and timber-yards, and on the shore E. of the harbour is an extensive ropery, for making cordage from New Zealand flax. *Pharmaceuticals.*" (*Bound. Rep.*) The other manufactures are local and unimportant.

The old bor. of Grimsby, which was co-extensive with the township, sent 2 mem. to the H. of C. from the reign of Edward III. down to 1832, the right of voting being vested in resident freemen paying scot and lot, of whom, in 1831, there were 400. The Reform Act deprived the bor. of one of its mem.; and at the same time, enlarged its boundaries by the addition of other par., as previously stated; that it now includes an area of 15,400 acres, and had, in 1831, a pop. of 6,589. Registered electors, in 1838-39, 581.

The old mun. bor. was governed by a high steward, mayor, recorder, 12 aldermen, and 12 common councilmen, all of whom were appointed by freemen becoming so either by birth, marriage, apprenticeship, purchase, or gift. It is now under the control of four aldermen (one of whom is mayor) and 12 councillors. The number of burgesses qualified to vote for municipal officers, in 1836, was 446. Petty sessions are held on Thursdays, and quarter sessions by the recorder. A court of requests, for the recovery of debts under 5*l.*, was established in 46 of George III. The local acts of the town are 36 and 39 George III. and 6 George IV. for improving the harbour, port, and town; also, 7 and 8 George IV. for inclosing lands within the parish. Markets on Wednesday, fairs 17th June for sheep, 15th Sept. for horses.

GRINSTAD (EAST), a market-town and par. of England, co. Sussex, rape Pevensey, on the high road between London and Brighton, 26 m. S. the former, and 22 m. N. the latter. Area of par., 13,290 acres. Pop., in 1831, 3,364. The town is pleasantly situated close to the N. border of the co. on an eminence commanding fine views of the country to the S. The streets, which are narrow and irregular, contain many good modern houses. The church, on the E. side of the main street, is a large, handsome building, of modern date, the old edifice having been destroyed by the fall of the tower in 1786. The present tower is lofty and well-proportioned, having pinnacles at the corners. The living is a vicarage in the gift of the Duke of Dorset, the lord of the manor. There are also places of worship for Wesleyan Methodists and Baptists.

The town-hall, which is large and commodious, was used as an assize court, till the Lent assizes were removed to Horsham. At the E. end of the town is Sackville College, endowed by Robert Earl of Dorset with an income of 330*l.* a year, and erected, in 1616, for the support of 24 unmarried persons of both sexes, each of whom has a comfortable room and 8*l.* a year in money. The establishment is governed by a warden and two gentlemen-assistants: a neat chapel is attached, where prayers are read every morning. A free grammar-school was founded in 1708, and endowed with a freehold farm in the par., the present rent of which is 4*l.* The number of free boys is 25, besides whom about 40 more pay for their schooling. The rent is taken to pay the master's salary, and the school is on the whole well conducted, though Latin and Greek have not been taught for nearly 60 years. (*Curyle.*) Markets, chiefly for corn, on Thursday. Fairs, April 21, July 13, and Dec. 11, for horned cattle and pedlary.

East Grinstead, before the passing of the Reform Act, by which it was disfranchised, sent 2 mems. to the H. of C., a privilege which it had enjoyed since the first of Edward III.; the electors were 55 burgh-holders, nominated by the Duke of Dorset, whose bailiff was the returning officer.

GRISONS (Germ. *Grailanden* or *Bunden*, an. a part of *Rhætia*), a canton of Switzerland, and, excepting that of Bern, the most extensive in the union, of which it occupies the S.E. portion. It ranks fifteenth in the confederation, and lies between lat. 46° 15' and 47° 4' N., and long. 8° 40' and 10° 29' E.; having N. the cant. Glarus and St. Gall, the principality of Lichtenstein,

and the Vorarlberg; E. the Tyrol; S. the Val-Tellina, Lombardy, and the cant. Ticino; and W. the last-named cant. and that of Uri. In the greater part of its extent, it is enclosed by the Austrian territories; but is cut off from them, as well as from the rest of Switzerland, at nearly every point, by lofty mountain ranges. Length, E. to S., 86 m.; greatest breadth about its centre 53 m. Area, estimated at 2,560 sq. m.; or, if the inequality of its surface be taken into account, at nearly 3,000 sq. m. Pop. (1838) 89,506, of whom 62,000 were Protestants and 24,000 Catholics. The whole canton is one mass of mountains and valleys; there is not a single plain worthy of notice. The main chain of the Rhaetian Alps crosses the canton from W. to E., at first separating it from Ticino and Italy, and afterwards dividing it into two unequal parts, the valley of the Rhine, being the larger, on the N.W., and that of the Inn, or the Engadine, on the S.E. A great portion of this chain is above the limit of perpetual snow. The *Muschelhorn*, 10,640 ft., the *Piz Val Rhin*, 10,280 ft., M. Moïoya, 11,480 ft. high, form parts of it, and it is crossed by the passes of the Splügen, St. Bernard, Albula, and Scaletta. From the E. extremity of the canton, a chain, little inferior in height to those of N.E., separating it from Uri, Glarus, and St. Gall. Another chain bounds the Engadine on the S.E., to which belong the Monte dell'Oro, 10,538 ft., and M. Bernina, 7,654 ft. high; and which is crossed by the Pass of Bernina, about 6,460 ft. above the level of the sea. A fourth chain, called the *Rhaetikon*, also including many elevated peaks, forms the boundary between the Grisons and the Vorarlberg. (*Bruguière, Orographie de l'Europe*. See also the art. *Alps* in this Dict.) Both the Rhine and the Inn rise in the Grisons, as do several tributaries of the Upper Adige, Po, and Adda: the Rhine receives most of the minor Rhaetian rivers. Climate and soil very various; but where the Rhine, Inn, and other rivers leave the canton, the general temperature is sufficiently high to admit of the cultivation of the vine. The scenery is peculiarly grand and magnificent; the canton contains upwards of 240 glaciers, comprising the largest in Switzerland. The nature of the country generally unfits it for agriculture; but in the Engadine, where the inhab. are very industrious, every patch of land is cultivated that is worth the pains. The corn raised is rye, barley, oats, and Turkish wheat; but not half the quantity required for home consumption is produced, and it is consequently imported to the annual value of about 300,000 florins. (*Picot*.) Hemp and fax, also, though pretty generally grown, are not produced in sufficient quantities for home demand. Potatoes have been cultivated only of late years. Fruit and wine are among the articles of export. The chief wealth of the canton consists in its cattle. Its pasture lands are estimated to feed, in the summer, 100,000 head of cows, oxen, &c., besides from 50,000 to 70,000 goats, and perhaps 100,000 sheep, much of which are driven from Italy to feed in the Alpine pastures for about three months, under the care of Bergamasque shepherds. The best breed of cattle is that of the Prottingen (or valley of the Lanquart); but the best cheese is made in the Engadine; some of which, Mr. Inglis says, "far surpasses that of Gruyère." (*Switzerland*, p. 67.) A great many hogs are kept, most of them for home consumption. Rural economy, and the condition of the peasantry, vary very greatly in different parts. Throughout the Engadine, the land belongs to the peasantry, and each individual usually supplies his family with provisions and clothing entirely from the produce of the territory belonging to him. Poverty is here rare, and beggary unknown. Indeed, many of the inhab. of the Engadine are possessed of considerable property, which they have amassed in some of the commercial cities of Europe, chiefly as confectioners. Schools are numerous, and few of the children in the valley of the Inn are uneducated. In the valley of the Rhine, the peasants are also the proprietors of the soil, living upon the produce of their own lands; but, as in most other parts of the Grisons, they are not industrious. Their land is badly tilled; garden cultivation is ill-conducted; and the forests are neglected. In the *Tavetsch-thal* there is a good deal of squalid misery. Wages are, notwithstanding, high throughout the Grisons. There are some rich veins of metal, especially iron; but they are not wrought. Manufactures few, and mostly domestic; the principal are those of cotton fabrics, some of which are exported. The most profitable branch of commerce is the transit trade between Zurich and Italy, the route of which passes through the Grisons and over the Splügen, and is a source of wealth to Chur, the cap. (*See CAHN and ALPS*, p. 68.) The chief exports from the Grisons are timber, of the value of about 180,000*l.*, and cattle, mostly to Italy, to the amount of 70,000*l.* a year; the principal imports are corn, salt, oil, sugar, coffee, tobacco, foreign manufactured goods, and iron.

This canton comprises a confederation of little republics in itself. It consists of a number of communes,

exercising within themselves rights almost independent. These are united into 36 *Hoch-gerichte*, or high-jurisdictions, each of which is, in many important respects, independent, not only of the rest, but even of the supreme council. These high-jurisdictions are united into the 3 leagues of the *Grak Bunden* (Grey League), containing 8; the *Gottez-haus Bund* (League of the House of God), 11; and the *Zechngerichte* (League of Jurisdictions), 7 high-jurisdictions. The whole unite in electing a supreme federal legislative council of 66 members, chosen in the different jurisdictions and communities, by the universal suffrage of the male pop. above 18 (in some instances 17) years of age. The supreme council or diet of the leagues meets at Chur every year, in June, and appoints a commission of 9 members to prepare matters for its own consideration; and a minor council of 3 members, one from each league, to whom the executive duties are entrusted. It also elects the public officers of the canton generally, concludes treaties, &c., and appoints 9 judges to form a central court of appeal; though, for the most part, the communities and petty municipalities themselves exercise full judicial powers, and in each of the high-jurisdictions there is a power of life and death in criminal cases, which is acknowledged without appeal. The common law different in each jurisdiction, and every one has its own peculiar laws and usages, and by these the questions within their boundaries must be determined. The decisions of the supreme council have also to be submitted for approval to the jurisdictions and communities at large. The inhab. of the Grisons are fond of boasting of the liberties they enjoy; but, in point of fact, they are destitute of some of the most important rights of the citizens of really free states. A free press, and trial by jury, are unknown; and both the supreme council and the courts of law deliberate and determine with closed doors. There is, however, no direct taxation of any kind; the state revenues are derived from customs and duties on the transit trade, a monopoly of salt, passports, &c. The public revenue in 1832, amounted to 336,870 *fl.*; the expenditure to 221,782 *fl.* The annual surplus is devoted to the payment of a small cantonal debt, which at present amounts to about 18,000*l.* About 2-5ths of the pop. are of German, and 1-10th of Italian origin. The different communities elect and support their own clergy. The canton furnishes a contingent of 1,500 men to the army, and 12,000 Swiss francs annually to the treasury of the Swiss confederation. It has a militia of all its male inhab. from the ages of 17 to 60. Chur, Mayenfeld, and Ilanz are the only places worthy the name of towns. Few countries abound so much with ruined castles and other feudal remains. These belonged, in the middle ages, to the nobles, who for a long period were possessors of the soil. In 1396, a number of communities revolted against the feudal nobles, and, headed by the Bishop of Chur, formed the *Gottez-haus Bund*; in 1424, the *Grakbunden* was formed in a similar manner; in the W. part of the Grisons; and in 1428, the *Zechngerichte* in the E. In 1471, the 3 leagues entered into a common union; and, in 1497-8, formed an alliance with the Swiss confederacy, though it was not till 1798 that the Grisons became a canton of Switzerland. (*Helvetic and Weimar Almanacks*; *Picot, Statistique de la Suisse*, p. 411-436., *Ebel; Inglis's Switzerland*, p. 57-59. &c.)

GRODNO, a government of Russia, formerly included in the old k. of Poland; between lat. 51° 30' and 54° 20' N. and long. 28° 7' and 29° 49' E., having 120 m. W. to E. Minak, S. Volhynia, and W. Bialystok and the k. of Poland. Greatest length N.E. to S.W. about 200 m.; average breadth, nearly 75 m. Area, estimated by Schnitzler at 14,700 sq. m. Pop. probably 600,000. The surface is an alluvial or sandy plain, broken only by a few undulating chalk hills. The Niemen, Bug, Naraw, and Priepel, are the principal rivers; in the S. there are some large marshes. The climate is damp, and the atmosphere cloudy and foggy. The principal agricultural product is rye, about 6,525,000 hectolitres of which are sold to the produce annually, a third part of which is exported. Few other kinds of grain or vegetables are grown for food, but fax, hemp, and hops are raised in considerable quantities. There is a large extent of pasture land; cattle-breeding is pretty well understood; and the native breed of sheep, which has been much improved by crossings with the breeds of Silesia and Germany, yields good wool, which is a principal article of export. The forests are extensive. Many belong to the crown, and that of Bialorodja, a royal domain, occupies nearly 95,000 hectares. Iron, lime, nitre, and building-stone are found. Manufactures are hardly worth notice; the principal are those of woollen cloth, leather, and felt. The exports consist of corn, flour, cattle, and wool; much of the produce is sent to Memel, Königsberg, Vindau, Riga, &c., by the canal of the Niemen, and by land. The greater part of the inhab. are Russians, except in the N. where Lithuanians prevail. The nobles comprise about 1-34th part of the whole pop., and are principally Poles. Jews are very numerous. There

are some Tartars and colonies of German artisans. The dominant religions are the Rom. Catholic and the United Greek church. In 1832, there were 23 public schools, and 1,012 scholars. There were throughout the gov., at that period, only two printing-presses. Chief towns, Grodno the cap., Novogrodek, Slonem, and Brzeec (Brest Litofskil).

GRODNO, a town of Russian Poland, and cap. of the above gov. in the N.W. part of which it is situated, on a hill on the Niemem 85 m. S.W. Wilna, and 154 m. N.E. Warsaw; lat. 53° 40' 30" N., long. 23° 49' 45" E. Pop. (1840) 10,000. Grodno was formerly considered the second town of Lithuania, and even disputed the superiority with Wilna. Its houses are partly of stone and partly of wood; and the greater number of its streets are extremely filthy. It has a fine castle built by Augustus III. of Poland, the ruins of a more ancient fortress, 9 Rom. Cath. and 2 Greek churches, a synagogue, and some handsome residences of the nobility, a gymnasium, an academy of medicine founded by Stanislaus Augustus, many other museums, a good public library, cabinets of mineralogy and physical objects, and a botanic garden. There are some inconsiderable manufactures in the town and its vicinity; and it has some well frequented fairs. (*Schmitzer, La Russie*, 412-420.)

GRONINGEN, a fortified city of Holland, cap. prov. of same name, and the most important town in the N. Dutch provs.; on the Hunse, at the influx of the Aa, 454 m. E. by N. Harlingen, and 50 m. N.E. Amsterdam; lat. 53° 13' 13" N., long. 6° 34' 18" E. Pop. 30,500. It is well built, and its market-place (*Bred-Markt*) is one of the largest and handsomest squares in Holland; and there is a fine public promenade, called the *Plantage*. It has a strong citadel, built in 1607, and is surrounded by ramparts and ditches, kept in good condition. Many of the public buildings are handsome, especially the great church of St. Martin, a Gothic structure, the spire of which is the loftiest in Holland; and the town-hall, erected in 1793. The university, founded in 1618, is usually attended by about 400 students, a much greater number than formerly. It possesses an excellent museum of natural history, a library, and a botanic garden. Groningen has an academy of painting, sculpture, and architecture, a seminary for deaf and dumb, another for the instruction of the blind, societies of natural history and chemistry, poetry, literature, and jurisprudence, and a branch of the society of "public good." It has a large paper manufacture, besides some factories of woollen and silk stuffs, cotton stockings, &c., and yards where merchant-vessels are sometimes built; but, speaking generally, the manufacturing industry of the place is but inconsiderable. It has an active trade in cattle, butter, &c.; and by means of a canal, large vessels come, from the estuary of the Ems, quite up to the town.

This town is not mentioned previously to the ninth century, and it was not fortified for several ages afterwards. It was first attached to the United Provinces in 1576; it afterwards fell into the hands of the Spaniards, but was finally retaken by Prince Maurice, in 1594. (*Dict. Geog.*; *Boyc's Murray's Guide Books*.)

GRUYÈRE (Germ. *Gregera*), a town of Switzerland, cant. Freiburg, 65 m. S. Freiburg. Pop., with some adjacent hamlets, 940. It is situated on a hill, the summit of which is crowned by the ancient castle of the counts of Gruyère, a fortress said to have been founded in the fifth century, and which is one of the most extensive and best-preserved feudal monuments in Switzerland. The town is walled, and contains a handsome parish church, a rich hospital, and a public library. The district around Gruyère is famous for its cheese, of which it produces about 25,000 cwts. a year. It is made on a chain of mountains, 10 to 15 miles in length, and in breadth all the cheese, though made in the same manner, is not of the same quality; the lower pastures not being in such estimation as those in the more elevated situations. The very finest qualities are said to be too delicate for exportation; and Mr. Ingis mentions that he tasted cheese in Switzerland far superior to any that can be bought in London or Paris. The whole district is divided into greater or lesser farms, which the proprietors let out on leases of 3 or 6 years, at rents varying according to the nature and elevation of the ground; the lower pastures, though not of the best quality, being the dearest, because, being sooner freed from the snow, and later covered with it, they afford food to the cattle for a longer time. The farmers who rent pastures, hire from the different peasants in the canton from 40 to 60 cows, from the 15th of May to the 8th of October, paying for them certain rates per head. Each cow, at an average, yields daily from 20 to 24 quarts of milk, and supplies 20 Swiss pounds of cheese during the 6 months. On the 18th of October, the farmer restores the cows to the different proprietors. The cattle are then pastured in the meadows, which have been twice mowed, until the 10th or 11th of November, when, on account of the snow, they are usually removed to the

stables, and fed during winter on hay and after-grass. Throughout the commune of Gruyère, the inhab. are above poverty. During a part of the year, there are not so many hands in the cheese country as are required, and these are of course borrowed from other and poorer communes. Wages are very high, in comparison with most other parts of Switzerland, being about 2s. 6d. a day, exclusive of living. (*Ingis's Switzerland*, 2c., p. 168; *Cornet's Switzerland*, ii. 226.)

GUADALAJARA, or GUADALAJARA, an inland city of Mexico, cap. of the state of same name (otherwise called Xalisco), in a rich and extensive plain, on the Rio Grande de Santiago, 130 m. from the Pacific, and 375 m. W.N.W. Mexico; lat. 21° 9' N., long. 103° 2' 15" W. Pop., which in 1803 was only 19,500, had in 1823 reached 45,800, and is now probably 60,000 (*Ward's Mexico*, ii. 357.), so that it is, in point of pop., the second city in the republic. It covers a great extent of ground, and at a distance has a very picturesque appearance. Its interior is also handsome; its streets are airy and well laid out, and many of the houses are extremely good, though mostly of only one story. There are 14 squares, the principal of which, the *Plaza de Armas*, has in it the government-house, in which the congress assembles; the cathedral, a fine edifice, though much injured by the earthquake of 1818; and the *Portales de Comercio*, consisting of piazzas or arcades built around three large square blocks of houses. "Within the town the Portales are the principal rendezvous, as besides a number of handsome shops, well provided with European and Chinese manufactures, they contain a variety of stalls covered with domestic productions, fruits of all kinds, earthenware from Tonalá, shoes in quantitas, mangas, saddlery, birds in cages, "dulces" of Calabazate, and a thousand other trifles, for which there seems to be an incessant demand. As each of these stalls pays a small ground rent, the convents to which the Portales belong derive from them a considerable revenue. They are the counterpart of the Parian in Mexico, but infinitely more ornamental, being built with equal solidity and good taste." (*Ward*, ii. 362.) Besides this public promenade, there is the *Paseo*, an extensive avenue shaded by double rows of fine trees, having a stream flowing through it, and leading to the *Alameda*, a public walk "very prettily laid out, for the trees, instead of being drawn upon in battle array, in lines, intersecting each other at right angles, like the streets, are made to cover a large tract of ground in irregular alleys, while in summer the intervening spaces are filled with flowers, particularly roses, which give both life and variety to the scene. There is a fountain too in the centre, and a stream of water all round." (*Ward*, ii. 361, 362.) Many of the public places are adorned with fountains. Besides the cathedral, there are several churches, with numerous monasteries and convents, a college maintained at the public expense on the most liberal footing, and for which a magnificent building has been erected, two ecclesiastical establishments for the education of young women, three for young men, five boys' schools, a public hospital, bishop's palace, mint (a fine building), and a neat theatre. A large pile of building, erected during the Spanish rule for a work-house, now serves as a barrack for about 500 men. The coffee-houses are tolerable, and the shops and market-places are well supplied with provisions, &c., but the last, which is large, is very ill-kept, and the hotels or inns are said to be filthy. The city is supplied with water from the Cerro de Col, three leagues distant; it is lighted at night, except at the time of the full moon, and watched by a patrol. Many of the streets look melancholy and deserted, "most of the lower orders being occupied in their own houses, where they exercise various trades in a small way, as in San Luis. They are good blacksmiths, carpenters, silversmiths, and hatters, and are famous for their skill in working leather, as well as in manufacturing a sort of porous earthenware, with which they supply not only all Mexico, but the neighbouring states upon the Pacific. Shawls of striped calico, much used by the lower orders, are made in considerable quantities, as were formerly blankets; but this branch of trade, after suffering much in 1812, when the port of San Blas was opened by General Cruz, has been destroyed entirely by the late importations from the U. States." (*Ward*, ii. 357.) There is at present little or no foreign trade, San Blas having been nearly abandoned for the ports of Mazatlan and Guaymas; and foreign goods are now brought overland, chiefly from San Luis or Mexico. When Mr. Ward visited Guadalajara there was but one foreign merchant house in it, which belonged to a British merchant. This city was founded in 1551, and in 1570 was erected into a bishopric. Under the Spaniards it was the cap. of an Intendency of the same name, and the seat of a royal *audiencia*, as well as of some flourishing manufactures.

In no part of Mexico have republican principles made such progress as in the state of Guadalajara. It was here that the revolution was brought to maturity, that the rise and fall of Iturbide was effected,

and the law banishing Spaniards from the country passed the senate. The government has shown a laudable desire to promote education. Lancasterian and other schools are diffused throughout the state; four printing presses have been established in the cap. since the revolution; and by the constitution, those who, after 1840, are unable to read, will lose the right of voting at elections; and in no part of Mexico has so vigorous and successful a resistance been made to the encroachments of the ecclesiastics, or the influence of the latter been so much diminished. (*Ward's Mexico*, li. 356-364.; *Humboldt*, *Essai*, &c. *Poinsett*; *Hardy*; *Thompson's Alcedo*, &c.)

GUADALAXARA, a town of Spain, and cap. prov. of same name, on the E. bank of the Henares, 35 m. S.W. Madrid; lat. 40° 33' N., long. 3° 22' 15" W. Pop., according to Mifano, 6,736. It was once walled, and fragments of its walls still remain. It is wretchedly built; the only buildings of any consideration being the palace of the Duke del Infantado, a large edifice, constructed with very little taste; and the church of the Franciscans, which contains a superb mausoleum of the duke's family, said to be second only in splendour to that of the Escorial. Here is a bridge over the Henares, originally built by the Romans, and restored in 1758. A woollen cloth factory established in 1765 by Philip V., is said to have employed in 1786, 4,000 hands, besides giving employment in spinning to no fewer than 40,000 in the adjacent villages. But, as might have been anticipated, it has greatly declined; and now scarcely pays, and most probably never did pay, its expenses. The town is the seat of a corregidor, and is governed by an alcalde of the first class.

GUADALQUIVIR, a river of Spain, having its sources in Murcia and La Mancha, and flowing S. W. through Andalusia. The source called the Guadalquivir, is in the Sierra de Casoria, lat. 37° 51' N., and long. 2° 58' W., but the true source, and that most distant from the mouth, the Guadarmena, rises in the Sierra de Alcaras, not far from the town so called; lat. 38° 48' N., long. 2° 30' W. The length of the river from this point is 240 m. direct distance, and 320 m. along the channel. The general direction is S. W. by W. as far as Seville, where it takes a turn nearly S., and, after forming two islands, Isla Mayor and Isla Minor, flows through a marshy and most unhealthy flat into the Atlantic, at San Lúcar. It is navigable for vessels of 100 tons as far as Seville, and for boats as high as Cordova, 774 ft. above the sea. The chief affluents are the Jandula, Guadiluv, Bembézar, and Bizar, on the r. bank; and the Guadalimar, Guadiana menor, and Xenil, on the l. Of these the Xenil, flowing through Granada, is the longest, being 130 m. long. The ancient name was Betsi: the present appellation is Arabic, *Wady-al-kebir*, the great river.

GUADELOUPE, one of the Windward Islands, in the W. Indies, and one of the most valuable colonies belonging to France, lying (inclusive of Grande-Terre) between lat. 16° 56' and 18° 18' N., and long. 61° 15' and 61° 55' W., 40 m. S.E. Antigua, and 30 m. N. Dominica. Together with its dependencies, the adjacent islands of Marie-Galante, La Désirade, and Les Saintes, and 2-3ds of the island of St. Martin (Leward Islands), the area and pop., in 1836, of the colony, has been estimated as follows:—

Islands.	Area in English sq. m.	Free Pop.		Slave Pop. *		Total.
		Male.	Female.	Male.	Female.	
Guadeloupe	534					
Marie-Galante	60					
Les Saintes	5					
La Désirade	5					
St. Martin	20					
Grand Total	633	32,059		95,609		127,668

Guadeloupe is divided into two unequal parts by the *Riviere-sainte*, or Salt River, an arm of the sea about 6 m. in length, and varying in width from 80 to 120 yards. The division S. W. of this inlet is Guadeloupe Proper; that on the N.E. is called Grande-Terre; the former is of an oblong shape; length, N. to S., about 25 m.; average breadth, about half as much; area, 82,289 hectares. A chain of volcanic mountains, covered with woods, runs through the centre of the island, nearly in its entire length. The medium height of its summits is somewhat more than 3,000 ft., but, near its S. extremity, the *Soufrière*, a volcano still exhibiting a smouldering activity, rises to 5,108 ft. above the level of the ocean. A multitude of rivulets, by which every part of the island is well watered, run down the flanks of this mountain chain; two of them, the Goyave and Grande, are navigable for small craft, and highly useful for the conveyance, upwards, of sea-nud, to mature

the lands, and downwards, of the produce of the land.

Guadeloupe contains many mineral springs. The island of Grande-Terre is of a triangular shape, and has an area of about 55,928 hectares. It is little raised above the level of the sea, and differs remarkably in its features from Guadeloupe. It is almost a level plain, with only a few scattered hills. It is destitute of woods, and its rivers are insignificant; in consequence of which thearain, which is much less frequent than in Guadeloupe, is obliged to be carefully preserved in cisterns. Marie-Galante, a circular-shaped island about 12 m. to the S.E., is traversed, E. to W., by a chain of hills, which, like those of Guadeloupe, abound in timber. The mean temperature of the year at Basse-Terre is about 81° Fah.; its annual range is between 70° and 99°. In the sun, the thermometer sometimes rises to 130° Fah.; the heat is, however, tempered by land or sea-breezes. The atmosphere is remarkable for humidity. About 86 inches of rain falls annually, on an average, chiefly between the middle of July and the middle of October. Like the other Antilles, Guadeloupe, is very subject to hurricanes, and shocks of earthquakes are frequent. The soil is light and easy of tillage, but its productiveness is owing more to the heat of the climate and the abundance of water than to its richness. The soil of Grande-Terre is, on the other hand, very rich. Almost every part of that island is capable of cultivation, and, notwithstanding the deficiency of water, it is very productive. The total surface of the colony is said to have been divided as follows, in 1835:—

Islands.	Total Surface.	Cultiv. Lands.	Pasturages.	Woods.	Uncultivated.
	Hectares.	Hectares.	Hectares.	Hectares.	Hectares.
Guadeloupe	138,212	38,004	19,601	20,526	59,879
Marie-Galante	15,544	4,109	5,89	1,192	6,536
Les Saintes	1,256	162	89	192	813
La Désirade	4,330	629	457	121	3,123
St. Martin	5,371	1,841	241	674	2,615
Total	164,513	44,745	23,789	23,141	72,838

The following table shows the mode in which the cultivated lands were occupied, in 1836, the number of slaves employed, and the quantities of produce obtained:—

Articles grown.	No. of Hect. cult.	No. of Slaves employed in culture.	Produce.
Sugar-cane	24,575	42,167	Raw sugar 34,697,068 kilog. 139,634 — Syrop and Molasses 5,964,750 litres. Rum 2,381,175 — 471,683 kilog.
Coffee	5,838	6,037	68,194 —
Cotton	1,027	1,615	10,601 —
Cocoa	179	132	329 —
Olives	2	9	34,047 —
Tobacco	20	9	
Mulberry-tree	11	126	
Corn, Pulse, &c.	13,100	3,490	
Total	44,750	55,701	

The sugar-cane, at present grown, is of the Otaheitan variety, and was introduced in 1790, after the other kinds were found to have degenerated. For the last fifteen years its culture has very much increased, and in a great measure superseded that of coffee. Most of the kitchen vegetables of Europe are raised in the gardens at Basse-Terre; but they degenerate rapidly; tropical fruits, and others of the S. of Europe, attain considerable perfection. Agriculture has been much improved of late years by the introduction of the plough and the use of manure, including lime, salt, &c. The sugar manufacture has been also greatly improved by the introduction of steam-mills. The live-stock consists principally of black cattle, sheep, and mules. Guinea grass is the only forage grown.

The manufacturing establishments are limited to 3 tanneries, a pottery, and about 34 limekilns. The various trades and handicrafts in the colony are exercised by about 1,600 individuals, chiefly whites, or free coloured labourers. There is no fishery on any extended scale; but about 30,000 killog. of fish are annually taken. We subjoin an

ACCOUNT of the Quantity and Value of the principal Articles exported from the island in 1836.

Articles exported.	Quantity.	Value.
Raw sugar	36,877,548 kilog.	21,807,322 fr.
Molasses	2,554,434 litres.	96,583
Rum	167,945	95,401
Coffee	912,534 kilog.	1,464,567
Dye-woods	513,912	102,482
Cotton	95,844	197,683
Copper	13,851 grammes.	37,486
Gold and silver	309,919	89,179
Other articles	—	185,019
Total	—	24,575,141 fr.

* From July 1830 to Jan. 1837, 9,637 slaves were emancipated, about 1-10th part of whom purchased their liberty.

Nearly all the exported articles are sent to France, whence 9-10ths of the imports are derived. The imports are chiefly salted meat and fish, wheat, flour, maize, pease and beans, olive oil, cotton, linen, and silk fabrics, wine, timber, candles, perfumery, hats, &c., amounting, in 1836, to the value of 26,769,217 fr. In the same year, 518 French vessels, of the aggregate burden of 70,027 tons, entered, and 543, of the burden of 69,066 tons, left the island: the number of foreign ships which entered and left was 156. The principal roadsteads and ports are those of Basse-Terre, and Mahault, in Guadeloupe; Pointe-à-Pitre, and Moule, in Grande-Terre; the roadstead of Saintes, and a few others.

Guadeloupe and its dependencies are divided into 3 arrondissements, 6 cantons, and 24 communes. The legislature consists of a governor, and a colonial council of 30 members, elected for 6 years, by natives of France resident in the island, above 25 years of age, paying taxes of 300 fr. a year, or having a capital of the value of 30,000 fr. In 1836, the number of electors was 1,092. To be eligible for a member of council, an individual must be 30 years of age, and pay taxes to the amount of 600 fr., or possess property of the value of 60,000 fr. In 1836, 619 persons were eligible for councilors. There is a royal court at Basse-Terre; the other tribunals are 2 courts of assize, 3 of original jurisdiction, and 6 tribunals of justices of the peace. The colony has a military commandant, and an armed force of 2,134 men, including 100 officers. There are about 30 ecclesiastics, upwards of 80 public schools, and hospitals in the chief towns. The public revenue for 1837 was fixed at 4,112,318 fr., and the expenditure at 4,396,967 fr., leaving a surplus of 15,351 fr.; but of the former only 2,134,521 fr. were contributed by the colony. Basse-Terre, the cap. of Guadeloupe, and the seat of government, on its S.W. shore, is clean, well built, and contains 5,500 inhab. It has two parish churches, a government house, hall of justice, a large hospital, an arsenal, some good public fountains and promenades, and a fine colonial garden. It is defended by several batteries on the side of the sea.

Capesterre, on the E. side of the island, is its other chief town. Pointe-à-Pitre, a town of 12,000 inhab., is situated at the W. end of Grande-Terre. It owes its prosperity to its excellent port. It is regularly built, has a handsome church, and many good private edifices. Several forts protect its harbour. The other towns are insignificant; but three of them, besides the foregoing, have their own municipal councils. These islands were discovered by Columbus, in 1493: the French took possession of them in 1635. Guadeloupe has, on several occasions, been taken by the English, and was occupied by British troops from 1810 to 1815, when it was restored to France. (*Notices sur les Colonies Françaises*, tom. i.; *Official Reports*; *Encyc. des Gens du Monde*.)

GUADIANA, (an. Anas, Arab. Wady-Ana), a river of Spain, rising in the mountains of La Mancha, about 16 m. N.W. of Villahermosa, lat. 39° 57' N., long. 2° 46' W., and flowing through New, with a streamer, and a part of Portugal. It has several sources, which form small connected lakes, called the Lagunas de Huidera. Its direction at first is N.N.W. for about 30 m.: it then disappears among the marshes, and is not traceable for 14 m. It rises again N.E. of Daymiel, at a place called Los Ojos de Guadiana, with a general E. direction past Merida, as far as Badajoz, where it turns S., and after a very tortuous course of 424 m., enters the Atlantic by two mouths. It is navigable about 45 m. as far as Mértola, to the falls called *El Salto del Lobo*. The chief affluents are the Gíguela, the Guadarranque, and the Ocelras, on the r., and the Jabalon, the Guadalema, the Ardilla, and the Chanza, on the l. bank. With the exception of the Gíguela, the affluents on the l. bank are by far the largest.

GUADIX (an. Acti), a town of Spain, prov. Granada, on the river of same name, 32 m. W. by S. Granada, and 216 m. S. Madrid. Pop., according to Mifano, 9,110. It is an old walled town, with steep, narrow, and badly-paved streets. It has a cathedral, built in the Corinthian and Composite orders, a handsome portico, 5 par. churches, convents, and an hospital. The approach to the town is through a fine avenue of trees, and the surrounding land is rich, and subjected to irrigation. The chief branch of industry is the manufacture of large clasp knives. (*Townsend*, iii. 102.) Ingls remarks that "Guadix is famous for its midnight frays." It is a bishop's see, and is the seat of a corregidor. (*Ingls*, ii. 196.)

GUAMANGA, or HUAMANGA, called also *San Juan de la Victoria*, or *de la Frontera*, a city of Peru, cap. prov., on the river of same name, in an extensive and beautiful plain, 110 m. E.S.E. Lima, and 185 m. W.N.W. Cusco. Pop. 25,000. It is well built, has good squares and streets, and the houses, which are of stone, have gardens and orchards attached to them. Alcedo affirms that no town in Peru is to be compared with it as to its buildings, and speaks very favourably of its climate. It has a cathedral, with several other churches and con-

vents; and a university with faculties of philosophy, divinity, and law. Guamanga, the seat of an intendant, and the see of a bishop, it was founded by Pizarro, on the site of an Indian village of the same name, for the convenience of the trade between Cuzco and Lima. (*Dict. Géog.*; *Mod. Trav.*, xxvii.)

GUANARE, a town of the repub. Venezuela, dep. Orinoco, prov. Varinas, on a river of the same name, 45 m. S.E. Truxillo, and 65 m. N.N.E. Varinas. Pop. 12,300. It has wide and straight streets, and neatly built houses. A handsome church, the interior of which is splendidly adorned, contains a shrine of our Lady of Concomorato, much resorted to by pilgrims. The chief wealth of the inhab. is derived from their trade in cattle, of which they possess large herds; and which, together with mules, &c., they export by way of Coro, and Puerta Cabello.

GUANAXUATO, or GUANAJUATO, an inland and mining city of Mexico, cap. of the state of same name, in the Sierra de Santa Rosa, 6,836 ft. above the level of the sea, and in the very centre of the richest mining district in the whole country, 156 m. N.W. Mexico; lat. 21° 0' 18" N., long. 79° 23' 53" W. Pop., including its suburbs, according to Humboldt, in 1808, 70,600, which number had, however, diminished to 34,000 in 1835. The town is very irregularly built: the streets are full of ascents and descents, many of which are so steep as to render the use of four mules in the carriages of the more wealthy inhabitants almost universal. The open spaces cannot be called squares, for they are of irregular and indescribable forms: the whole city, in short, is distributed here and there, wherever vacancies at all adapted for building have been left by the mountains. One part is so hidden from another, that, viewed from the streets, it appears to be a small town. "It is only by ascending the heights on the opposite side that a view is gained of the whole valley, broken into ravines, along the side of which the town is built. Surveyed from this point, the novelty of its situation strikes the stranger with astonishment. In some places it is seen spreading out into the form of an amphitheatre; in others, stretching along a narrow ridge; while the ranges of the habitations, accommodated to the broken ground, present the most fantastic groups." (*Mod. Trav.* xxvi. 2.) The houses also have a singular appearance: they are large, and well built of hewn stone, but disfigured by their fronts being painted of the gayest colours! Some of the residents belonging to the principal families are, however, really magnificent as the decapal families, and the Alhondiga, or public granary. But the civil war, and the decay of the mines, has inflicted great and, perhaps, irreparable injury on the city. The town and its suburbs have numerous amalgamation works, one of which sometimes occupies a whole ravine, the spaces above, on either side, being crowded with miners' huts. Guanaxuato suffers two serious inconveniences; one is, a scarcity of water, there being within the city only a few cisterns belonging to wealthy individuals; so that most part of the most important necessities have to be brought a distance of 2 m. upon the backs of mules, or the other is, that during a portion of the year it is liable to inundation from the torrents which descend from the mountains, and, though works to prevent this have been constructed at a great expense, few years pass without some accidents occurring. Some of the public highways have been strangely neglected. On approaching Guanaxuato from the S., there is, indeed, a raised path for foot-passengers, but coaches and animals of all kinds have to proceed up the bed of a river, which during the rainy season rushes along with dangerous impetuosity.

This town has been entirely created by the mines which surround it. In the vicinity of some of them, little pueblos, as Valenciana, Rayas, Serena, &c., have been formed, which may be considered as its suburbs. The first mine—that of St. Barnabé—was opened in 1548; but it is only within the last 70 or 80 years that the mines of Guanaxuato have become so famous. In 38 years, viz. from 1769 to 1803, they produced gold and silver of the value of 168,000,000 piastres, or 12,800,000 lbs. s.; the annual average produce being 556,000 marcs of silver, or 364,911 lbs. tr., and from 1,500 to 1,600 marcs of gold. (*Mod. Trav.* xxvi. 3.) The *Veta Madre*, or great "mother-vein," is composed of several parallel veins running N.W. and S.E. for rather more than 5 leagues, within which distance there have been upwards of 100 shafts opened. According to Humboldt, the mother-vein has yielded more than a fourth part of the silver of Mexico, and a sixth part of the produce of all America. The principal mines situated on this vein are those of Valenciana, San Juan de Rayas, Mellado, Socho, Cata, Iteoyaca, Serena, &c. When Humboldt visited these works in 1802, they employed 5,000 workmen, 1,866 grinding mills, and 14,618 mules; and before the revolution of 1810, they yielded, in all, 10,000 mule-loads of ore, of 11 arrobas (275 lbs.) each, weekly; making 62,562 parcels of 23 quintals of ore yearly, worth 7,737,500 dollars. Of this quantity, the mine of Valenciana alone produced from 8,000 to 6,000

loads, Rayas 1,500, and the other mines the remainder. (*Poinsett's Notes*, &c., 306, 307.) According to Mr. Ward, the mother-vein supplied bullion from 1766 to 1839 (the date of his publication), of the value of 225,935,736 dollars. (2½ fl. 189.)

"The mine of Valencianna," says Humboldt, "is the sole example of a mine which, for forty years, has never yielded less to its proprietors than from 2,000,000 to 3,000,000 fr. (80,000 to 100,000) annual profit" (*Polit. Essay*, iii. 193.). It is at the N.W. extremity of the mother-vein. After having been abandoned for a long period as unprofitable, it began again to be wrought about 1769, by M. Obregon, a young Spaniard without capital, but with good credit and great perseverance. In 1768, considerable quantities of silver began to be extracted from it; and from 1771 till 1804, it constantly yielded an annual produce of 600,000*l.*, the net profit to the proprietors being in some years as much as 250,000*l.* At that period, 1,800 men were employed in the interior of the mine, besides 300 men, women, and children employed without in different ways; and Valencianna (a town which afterwards contained 22,000 inhab.), at an early part of these proceedings, sprang up, and had between 7,000 and 8,000 inhab. on the very spot where goats had been browsing 10 years before. The machinery of this celebrated mine was much injured by Hidalgo in 1810, and destroyed by Mina after his unsuccessful attack on Guanaquato in 1818. When the Anglo-Mexican Mining Association undertook to drain and work the mine, it was nearly 3-4ths filled with water, and the town of Valencianna had become a ruined place, with only about

4,000 inhab.; and notwithstanding the expenditure of vast sums by the Association it has not hitherto recovered its former productiveness.

Much of the landed property in this and the neighbouring states, belongs to the great mining families resident in Guanaquato. The vicinity of this city abounds with tillage-land, yielding rich crops of wheat, barley, maize, &c., orchards, gardens, &c. Agriculture has been much depressed through the injury done to the mines, and the suspension of mining labour. Guanaquato was founded in 1545, constituted a town in 1619, and a city in 1741. (*Humboldt*; *Ward*; *Hardy*; *Poinsett*; *Sketches of Society in Mexico*; *Mod. Trav.*, &c.)

GUATEMALA, GUATIMALA, or CENTRAL AMERICA. Under this term is included the long and comparatively narrow tract of country connecting the continents of N. and S. America, lying between lat. 8° 5' and 16° 50' N., and long. 80° 50' and 94° 12' W.; having N. the Mexican provinces Tabasco and Yucatan, and the Bay of Honduras, E. the Caribbean Sea and the Columbian province of the Isthmus, and S. and W. the Pacific Ocean; length, N.W. to S.E., about 1,000 m.; breadth varying from 50 to 250 m. Besides the British settlement of Honduras, and the independent territories of the Mosquito Indians and Poyais, Central America includes the territories of 6 republican states, and a federal district common to the latter, the area, pop., &c. of which have been estimated as follows by Don G. Galindo in the *Geographical Journal*, vol. vi., and the *American Almanack* for 1840:—

Republics.	Area in Eng. sq. m.	Population.				Chief Towns.
		Indians.	Whites.	Ladinos.	Total Pop.	
1 Guatemala	196,000	600,000	104,000	170,000	464,000	Guatemala.
2 Quetzaltenango		-	70,000	280,000	350,000	Quetzaltenango.
3 Honduras		-	110,000	180,000	290,000	Comayagua.
4 Nicaragua		120,000	60,000	180,000	360,000	Leon.
5 Salvador		25,000	125,000	-	150,000	San Vicente.
6 Costa-Rica		25,000	13,000	28,000	66,000	San José.
Federal District*						San Salvador.
Total	196,000	740,000	482,000	778,000	2,000,000	

The above table has few pretensions to accuracy, no general census having been taken since the declaration of independence. In the pop. of Honduras is included that of the Mosquito coast; that of Guatemala comprises the British settlers of Belize, &c., amounting to about 4,000; and to that of Quetzaltenango are added 6,168 inhab. of the prov. Soconusco on the Pacific, which has remained, since 1823, as a neutral territory between Central America and Mexico.

Physical Geography.—No very distinct mountain chain traverses Guatemala, but an elevated plateau occupies the central parts of the country, forming a kind of chain of communication between the Cordilleras of S. America and the mountain chains of Mexico. This plateau rises much more precipitously from the side of the Pacific than the Atlantic, the general slope of the country being to the N.E. The table-land rises also considerably as it proceeds N.W.: in Costa-Rica and Nicaragua its highest parts are of very moderate elevation, and the lake of Nicaragua, situated in a plain bounded on either side by hills of no great height, is less than 134 ft. above the level of the Pacific. In the states of Guatemala and Quetzaltenango, the table-land averages perhaps 5,000 ft. in height above the ocean: the loftiest summits, which are either active or extinct volcanoes, being in that part of the confederation. The Water Volcano, near Guatemala, so called from its frequently emitting torrents of hot water and stones, but never fire, is 12,620 ft. above the Pacific. There are two large plains—those of Nicaragua and Comayagua, besides many of less size on the banks of the larger rivers and along the shores: these principally consist of extensive savannahs with rich pasturage interspersed with clumps of trees. All the larger rivers flow N.E. or E., the proximity of the high mountain range to the Pacific permitting but a short course to these flowing W. The chief are the Motagua, Honda, Belice, Polochic, Rio de Segovia, the San Juan, connecting the lake of Nicaragua with the Atlantic, &c.; the banks of most of them are richly wooded. The Motagua is of considerable size, and useful for the conveyance of European and other goods into the interior of Guatemala. The lake of Nicaragua, 130 m. long by more than 40 m. average breadth, is by far the most important, and it will probably form an important part of the projected water communication between the Atlantic and Pacific. (For further details, see NICARAGUA, LAKE.) The other principal lakes are the Golfo-Dolce, and those of Leon or Managua, Peten, Atitan, Amatlan, &c. The Golfo-Dolce, 34 m. long by 10

broad, receives several rivers, and discharges itself by the Rio Dolce into the Bay of Honduras. Central America possesses an advantage over Mexico in having excellent harbours on both seas; its coasts are indented by deep and capacious gulphs, as those of San Juan and Chiriqui, on the Caribbean Sea, and of Nicoya, Papago, and Conchagua, on the Pacific. A few islands surround the shores, but they require no description. (*Galindo*, in *Geogr. Journal*, vi., &c.)

Climate.—The coast plains are subject to violent tropical heats, and are very unhealthy, especially those on the Caribbean Sea, where fevers incessantly prevail. These are chiefly inhabited by the Indian pop., whose constitutions are better able to resist the pernicious nature of the atmosphere than those of Europeans. The climate of the table-land varies according to its elevation, but an equable, moderate, and agreeable temperature may be obtained there all the year round, with a perfectly healthy climate. The dry season lasts from October to the end of May, during which N. winds prevail; and in the table-land, in November and December, water exposed to the open air at night, is sometimes, though rarely, covered with a thin pellicle of ice. The rest of the year is entitled the wet season; but the rains, though heavy, last only during the night, and the days are fair and cloudless. Earthquakes are very frequent. *Goitre* is a common disease in the high regions of Central America.

Mineral Products.—The precious metals are found in great abundance in Honduras, Costa Rica, and other provinces; with copper, iron, lead, nickel, zinc, antimony, &c.

The Vegetable Products are of greater importance. The forests yield many valuable kinds of timber, including mahogany, cedar, *palo di maria*, a species of wood well adapted for ship-building, &c. But the logwood tree (*Hæmatoxylon Campeachianum*, Linn.) is by far the most valuable of the products of the forests. It is found here and in the adjoining peninsula of Yucatan in the greatest perfection, and is a most important article of export; a species of Brazil wood is also exported. Among the other vegetable products may be enumerated the dragon's blood, mastic, *palm Christi*, and other balsamic, aromatic, and medicinal plants; with the sugar-cane, cocoa, indigo, coffee, tobacco, and cotton, which are extensively cultivated. The crops vary according to the elevation of the surface. Below the level of 3,000 ft., indigo, cotton, sugar, and cocoa, are the principal. The last is chiefly grown along the shores of the Pacific, and that of Soconusco was esteemed by the Spaniards the best furnished by their American possessions. The federal district is distinguished

* This is a circle round the city of San Salvador, 20 m. in diameter, with a circular extension of 10 m. towards the S., to include the settlement of Liberia on the Pacific.

for the growth of indigo, to which the agriculturists devote their attention so exclusively, as almost wholly to neglect the cultivation of articles of prime necessity. The culture of indigo is, however, very general throughout Central America, and, according to Humboldt, it was formerly produced to the value of 13 millions of livres a year. Between the heights of 3,000 and 5,000 ft., the Nopal, or cochineal plant, is a favourite object of cultivation, particularly in the neighbourhood of Guatemala. Maize is generally grown, but wheat only in the high table-land in the N. : it is almost unknown in Nicaragua and Costa-Rica. Flax and hemp, though they grow luxuriantly, receive little attention, owing to the superior facilities for growing and manufacturing cotton : and vanilla is suffered to run to waste for want of hands to gather and prepare it. Among the remaining kinds of produce, are tamarinds, cassia, long pepper, ginger, and others, which, though highly useful, are little known in commerce. A fruit called the *chicozapote*, yielding a great deal of substantial nourishment, supplies the place of maize, and forms a principal article in the traffic of some provinces.

Cattle.—Horses, asses, sheep, goats, and hogs, having been introduced by the Spaniards, are now found in great abundance. Large flocks of sheep are reared by the *Ladinos* on the table-land of Quetzaltenango almost solely for their wool, their flesh being very expensive, and only met with at the tables of the wealthy. Immense herds of cattle are pastured in the grazing farms of Nicaragua, where the country is not favourable for breeding sheep, and the most valuable resources of Costa Rica are in its cattle, sheep, hogs, and goats. The horses are not good; but the mules are very superior.

The *wild animals* comprise the American tiger, wolf, tapir, mountain-cow, wild goat, wild striped boar, flying squirrel, the *xorillo*, noted for its fetid odour, &c. Few of them are very formidable; but the densely wooded coast of the Pacific is much infested by dangerous reptiles, including the cayman, and several venomous serpents. The birds exhibit the most beautiful plumage. Locusts occasionally cause extensive devastation, and in some provs. swarms of warrior-ants frequent one house after another, clearing it, however, of all other vermin. The pearl-oyster is found on the coasts.

Industry.—Agriculture, and cattle and sheep breeding, are the chief occupations of the people; but the manufactures are not quite unimportant. While it belonged to Spain Guatemala produced most of the cotton and woollen fabrics required for its own consumption: at

present the former are chiefly imported from Great Britain, but coarse woollens are still manufactured, together with some cotton cloths, caps, hats, &c. A good many hands are also employed in making earthenware, furniture, wooden articles in cabinet work, &c., and an inland trade is carried on in mats, woven of different colours by the Indians, and used at Guatemala as carpets.

From the mine called *Tuxtepec* (Costa Rica), says Alcedo, "not less riches have been extracted than from that of Potosi in Peru." That state has also the gold mine of Aguascat, which began to be wrought about 1821; but we have no recent accounts of its produce. Several companies have been at different times formed to work this and other mines, and the government have long been endeavouring to induce capitalists to undertake the working of the silver mines in the prov. of Comayagua (Honduras). In the prov. Chiquimula, in the same state, some mines have been wrought to considerable advantage. According to a report of the assay master of the mint, every cent of ore from these mines formerly yielded 17 marcs 6 3/8 oz. (the marc = 8 oz.) of silver. A mine at Tabasco, in Salvador, used to be wrought to advantage by an English house in Belize. Most of the metallic wealth raised in Honduras is smuggled in bullion through Belize, and the Mosquito coast to Jamaica; not more than 1-3d part of the whole obtained in the Confederation being sent to the head mint. Owing, however, to the coinages duties in Mexico, Peru, and Chili, considerable quantities of the precious metals are sent from those countries to be coined at the mint of Guatemala. At Tegucigalpa, in Honduras, there is a mint coining about 1,400 dollars a-week of *manquequina*, or cut money. Private coining, and base money, are common, especially in Nicaragua.

Commerce.—The foreign trade of the Confederation, though considerable, is trifling compared with what it might be were the inhabitants intelligent and enterprising. The principal articles of export are bullion, indigo, cochineal, dye-woods, sarapilla, balsam of Peru, hides, tortoise-shell, &c. The imports consist chiefly of cotton, linen, and silk fabrics; hardware, and cutlery; earthenware, wines, trinkets, &c. The trade is principally in the hands of the English and Americans; but being mostly carried on through Belize, its amount cannot be exactly specified. The principal ports on the Pacific are Realajo, Calderas, La Union, Libertad, Acajutla, and Itepa; those on the Bay of Honduras and the Caribbean Sea are Omoa, Truxillo, and San Juan de Nicaragua. The following is a

STATEMENT of the Quantities and Value of Goods imported into and exported from Central America, in 1835.

Imports.		Articles.	Exports from									
Articles.	Value.		Guatemala.		San Salvador.		Honduras.		Nicaragua.		Costa-Rica.	
	Dollars.		Quantities.	Value.	Quantities.	Value.	Quantities.	Value.	Quantities.	Value.	Quantities.	Value.

								3,788,000 dollars.				

The Government is modelled on that of the U. States. Since 1824, Central America has formed a federal republic, with a president, vice-president, senate, and a house of representatives. The house of representatives is composed of deputies selected by the people in the proportion of one to every 30,000 inhab.; half its members are re-elected annually. The senate consists of two members from each state; one third of the senators are re-elected every year. The president and vice-president, elected for four years, are entrusted with the executive power. There is a supreme court of justice, composed of six members elected by the people, which decides in cases of final jurisdiction, and has a power of judicature over the president, senators, ambassadors to foreign states, secretaries of state, and other functionaries. One third of its members are re-elected every two years. All elections are conducted through the medium of electoral colleges, as in France.

Each of the states has for its internal government an

assembly of deputies, a council with powers similar to the senate, and a chief and deputy chief with functions similar to those of the president and vice-president. The cities, towns, and villages have municipalities, the members of which are annually elected, and at which the *alcaldes*, or chief justices, preside. Three ministers of state, appointed by the president, superintend the departments of foreign and home affairs, finance, and war. In the state of Guatemala the Spanish laws have been entirely abolished, and the code compiled by Mr. Livingston, of the U. States, substituted in their stead.

Religious Establishments.—The Roman Catholic is the established religion, but complete religious toleration exists. The archbishop of Guatemala is primate; there are three bishops, those of Leon, Comayagua, and Ciudad Real; and the whole country is divided into about 800 parishes, each having a curate with an income of about 1,500 dollars a year. The monastic orders have been wholly suppressed; and the few nunneries that

exist are not permitted to enforce the residence of their inmates against their will. Each of these establishments has attached to it a free school for the education of the poor in reading, writing, arithmetic, and religious principles. Slavery is entirely abolished.

People.—The Indians of the state of Guatemala preserve to a great degree their aboriginal languages and customs, but in the other states they speak a Castilian patois, and their manners are assimilated to those of the mass of the pop. The chief occupation of the settled tribes is agriculture; some are engaged as workmen in various manufactures. They live in great harmony with the whites, but entertain a dislike to the *ladinos*. The latter are a mixed breed between the whites and Indian tribes; their complexions are much fairer than those of the W. Indian mulattoes, and many are little distinguishable in appearance from the whites. The latter are mostly of Spanish descent. It is alleged, but we are very doubtful as to the authenticity of the statement, that among the whites and *ladinos* there is an extraordinary excess of female over male births, the former being to the latter, it is said, nearly as 6 to 4! Among the Indians the births of males and females are about equal. (*Geog. Journ.* vi. 196.)

History.—The N.E. coast of this region was discovered by Columbus in 1502. Most part of it was conquered by the Spaniards about 1524, and erected into a captain-generalship by the emperor Charles V., in 1527. The policy adopted by Spain towards Guatemala was attended with unmitigated benefit to the latter. Being only a captain-generalship, the scale of its public expenditure was kept down in deference to the higher pretensions of the Spanish viceroynalties, and as its financial wants were few, taxation pressed lightly on the people. It was not, however, permitted to export more of its native products than were sufficient to pay for the articles which the merchants of Cadiz thought necessary to send for its consumption! Central America became independent in 1821, and was subsequently incorporated with Mexico, but on the fall of the latter, it disconnected itself from the Mexican republic and was formed into a separate confederation in 1823. After its separation from Spain, its finances suffered greatly from the remission of the tribute formerly paid by the Indians, and the abolition of the taxes on cards, the moiety of secular revenues, bulls, and some customs and tobacco duties, and the reduction of the ordinary *alcavala* duty from 6 to 4 per cent. The national debt was thereby greatly increased, but a powerful impulse was, at the same time, given to national industry. Since the declaration of independence, the country has been disturbed by frequent civil wars; but those have at present happily subsided. (*Thompson's Official Visit to Guatemala; Hawkins; Central America; Encycl. Americana; Galindo, Roberto, &c.*)

GUATEMALA (SANTIAGO DE), or NEW GUATEMALA, a city of central America, cap. repub. of same name, in the spacious plain of *La Virgen*, in the valley of Mexico, 1,800 feet above the level of the sea, 106 m. W.N.W. San Salvador, and 655 m. E.S.E. Mexico; lat. 14° 37' N., long. 90° 38' W. Pop. 40,000. Viewed at a distance from the surrounding mountains, a few cities present a more beautiful aspect. It lies in the midst of sloping meadow lands and rich plantations; its walls, domes, and steeples being covered with a white and glittering cement. It forms a square divided into 4 quarters, each of which is again divided into two *barrios*, or wards, superintended by their own *alcaldes*. The streets, which are 12 yards broad, are mostly paved, and in their centre is usually a streamlet of water. To obviate the danger of earthquakes, the houses are only one story high; but they occupy a considerable space, being built in squares, round one or more open courts. The roofs are flat. The *Plaza*, or Great Square, is a rectangle, 150 yards each way, surrounded on three sides with colonnades, and having in it the cathedral, with the archbishop's palace, the *College de Infantes*, the old royal palace, and various government offices, including the supreme court of justice, treasury, and mint; the town-hall, prisons, markets, public granary, custom-house, &c. In the middle is a large stone fountain, of very superior workmanship, supplied with water brought by pipes from the mountains upwards of 2 leagues distant; the same source supplying 13 public reservoirs, in different parts of the city, besides many belonging to convents and private houses. Besides the cathedral, there are a great number of highly ornamented churches; and Mr. Thompson affirms, that "in the republic the cost of religious worship is equal to twice the expenses of the government!" (p. 145.) There is a university, but it is on a limited scale. Girls' schools are attached to the nunneries, and there are some endowed schools for boys; but, according to a recent account, the total number of children receiving instruction does not exceed 500. On the N.E., adjoining the city, is an extensive suburb, divided into two quarters and four *barrios*. Guatemala has manufactures of fine muslins, gauzes, calicoes, and

GUAYMAS.

common cotton goods, earthenware, and china of very good quality, &c. Among the females are excellent embroiderers, dress-makers, and florists; many also are employed in the manufacture of cigars, and spinning cotton yarn of all degrees of fineness. The inhab. possess an aptness for the arts, and are particularly noted as workers in silver, sculpture, and musicians. Their chief entertainments are *pic-nic* parties to the surrounding country; bull fights, a circus for which stands about half a mile from the city; and the theatre, an edifice partially open to the sky, the performances in which take place during daytime. Religious festivals have always been celebrated in this city with great magnificence. On Sundays, from sunrise till 11 o'clock, the churches are devoted to public worship, and filled with successive congregations; but at the latter hour a new scene commences. The church doors are shut; the *plaza*, which till then had been filled with crowds hurrying to and from their devotions, is suddenly converted into a fair: stalls and booths are erected in all parts of it, and the remainder of the day is devoted to business or pleasure.

Guatemala is the seat of the government of the repub. of the same name, and was until recently that of the whole confed. of central America: it is also the see of the primate. It was founded in 1776, after the destruction by an earthquake of old Guatemala, 25 m. W. by S. from the new city. But the latter has been again rebuilt, and is a favourite place of resort, having seldom fewer than from 12,000 to 18,000 inhabitants. (*Thompson's Guatemala*, p. 469. &c.)

GUAYAQUIL, a city, and the chief sea-port of the repub. of Ecuador, Colombia, on the river of the same name, 163 m. S.S.W. Quito, and 43 m. N. by E. the isl. Puna, in the Gulf of Guayaquil; lat. 3° 11' 21" S.; long. 79° 42' W. Pop. 30,000. It is built principally on the N. bank of the river, and is divided into the old and new town, the former being occupied by the poorer classes. The city is tolerably well laid out; and as its houses are of wood, and it has frequently suffered from fires, much of it is comparatively modern, and has a good appearance. Its private residences are modestly built and furnished with arcades. It contains several good edifices, including the custom-house, 3 convents, a college, hospital, &c.; but from being situated on a dead level, and intersected by many creeks, the drainage is bad, and the streets are so swampy as to be sometimes impassable. Many of the inhab. live on the river, on *balzas*, or floating rafts, from 50 to 80 ft. long. The river opposite the city is about 2 m. wide, and has on its S. bank a dry dock, where several ships of a superior construction have been built. The city is unhealthy, and, like its whole prov., infested with vermin; it is ill supplied with water, which has to be brought from a considerable distance on *balzas*, which, indeed, are used for the conveyance of all kinds of goods. It deserves to be mentioned that, notwithstanding the severe injury the city has frequently received from fires, it has not a single fire-engine! The port of Guayaquil is one of the best on the Pacific, ships of large size coming up close to the town. It is defended by three forts, one being on the opposite side of the river. Ships bound for Guayaquil usually call at Puna for pilots. The principal articles exported are cocoa, sugar, hides, cattle, tobacco, calico wool, &c. We subjoin an account of the quantities of cocoa, exported from Guayaquil during each of the 3 years ending with 1838, specifying the countries to which they were exported, and the quantities shipped for each:—

Exported to	1836.	1837.	1838.

The following is a statement of the number and tonnage of the vessels, with the value of their cargoes, that entered inwards and cleared outwards at the port of Guayaquil in 1835:— [See top of next page.]

GUAYMAS, a sea-port town of Mexico, state Sonora, at the mouth of a considerable river, on the E. shore of the Gulf of California, 400 m. W.N.W. El Puente. Lat. 27° 52' N., long. 112° W. Pop., in 1836, about 3,000. It has grown up since the revolution, and owes its origin and rise to its magnificent harbour, the best in Mexico. This inlet is capable of accommodating 500 vessels, and is sheltered from all winds by the lofty hills which surround it, and the island of Paxaro, which forms a natural breakwater before its entrance. Close

Total	123	21,430	231,680	210,459

to the pier there are 5 fathoms water, and deeper soundings, with good anchorage, are found a short distance further off shore. The town consisted, in 1826, of about 300 houses. The more modern are large and well built; the rest are chiefly of mud, and flat-roofed. The climate is healthy though hot. Vessels, with provisions, have to be conveyed to the town from a distance of about 3 m., the immediate neighbourhood being arid and sterile. But the great commercial advantages of the place counterbalance these drawbacks, and will probably render it the principal commercial *dépôt* on the W. coast of Mexico: it being much superior as a port to either Mazatlan or San Blas, and easier of access than Acapulco to vessels from China or Calcutta, which, from the prevalence of particular winds in the Pacific, seldom make the Mexican coast S. of Guaymas. At this port and Mazatlan, indeed, all the trade between Mexico and E. Asia is now transacted. (*Ward's Mexico*, ii. 312, 313., *Hardy's Tour*, &c.)

GUAYRA (LA), the principal sea-port town of the repub. Venezuela, Colombia, gov. Caracas, on the Caribbean Sea, 11 m. N.N.W. Caracas: lat. 10° 36' 19" N., long. 67° 6' 49" W. Pop. 8,000. P. Humboldt observes:—"The situation of La Guayra is very singular, and can only be compared to that of Santa Cruz, in Tenerife. The chain of mountains that separates the port from the high valley of Caracas, descends almost directly into the sea; and the houses of the town are backed by a wall of steep rocks. There scarcely remains 100 or 140 fathoms' breadth of flat ground between this wall and the ocean. The town is commanded by the battery of *Cerro Colorado*, and its fortifications along the sea-side are well disposed and kept in repair. The aspect of this place has something solitary and gloomy. . . . The heat is stifling during the day, and most frequently during the night." (*Pers. Narrat. Trans.*, vol. iii., 383, 384.) In 1812 the town was nearly destroyed by an earthquake, from the effects of which it has not yet wholly recovered. Its port is a mere roadstead, open to the N. and E., and slightly sheltered to the W. by Cape Blanco. Vessels anchor in from 6 and 7 to 25 and 30 fathoms, according to their distance off shore; but though the anchorage be open, and there is a considerable surf, the holding-ground is good, and vessels properly found in anchors and cables are seldom driven from their moorings. The trade of La Guayra is extensive. The principal articles of export are coffee, cocoa, indigo, and hides. The imports consist principally of manufactured goods from England, provisions from the United States, with wines, &c. The town is unhealthy in summer, especially to strangers; and it is extremely hot, the mean temp. of the town being nearly 83° Fah. It was founded by Osorio in 1588. (*Humboldt*; *Comm. Dict.*)

GUBEN, a town of the Prussian dom., prov. Brandenburg, gov. Frankfurt, cap. circ. of same name on the Nelse, 27 m. S.S.E. Frankfurt-on-the-Oder. Pop. 9,256. It is the seat of the courts of justice for the circ., town, and district, a board of forest economy, a gymnasium, &c. It is one of the most populous and flourishing towns in the gov.; and, besides producing woolen and linen stuffs, yarn, stockings, &c., has tanneries, water-mills, and a copper foundry with building docks, and a considerable trade in cattle, wool, and agricultural produce: it has also a brisk transit trade.

GUERNSEY, an island in the English Channel, belonging to Great Britain, 75 m. S. the Isle of Portland, 22 m. E. the coast of Normandy in France, 22 m. S.W. Alderney, and 15 m. W. N. W. Jersey. Shape triangular; greatest length 9 m.; breadth 3 m.; area, 16,000 acres. Pop., in 1831, 24,349. The surface of its S. part is level with a low irregular line of coast; but the S. part is more lofty, varied with deep gullies; the coast is bold and precipitous, presenting fine marine scenery. The geological formation is almost entirely granitic, and quarries of gneiss and granites, at Grande Rocque, are extensively worked: on the W. side of the island, trap-rocks and micaceous schist occur. There are no metals of any kind. The climate, though inconsistent and occasion-

ally very moist, is not unhealthy. The winters are mild, snow seldom lying on the ground more than two or three days, and the summer heats are less oppressive than on the neighbouring coast of France, or even in the S.W. of England. The thermometer ranges from about 80° to 87°: prevailing winds are E. in spring, and W. the rest of the year. The water is excellent, and the lands are well watered by streams running in every direction towards the sea. Guernsey, in point of fertility does not equal Jersey, neither is it so well covered with timber; and it contains, especially in the N. considerable portions of waste, or imperfectly reclaimed land. Husbandry is much crippled by the almost infinite division of properties, which vary here from 5 to 12 acres, 30 acres being considered a large farm. This division is owing to the law, which gives to each son an equal share of his father's landed property. Farms of 7 or 8 acres, with house attached, let for 6*l.* in the country; but near St. Peter-le-Port, land fetches 9*l.* or 10*l.* an acre. The annual growth of wheat is estimated at 4,000 quarters: the growth of barley amounts to 3,800 quarters. These quantities supply only about a fourth part of the home consumption, the deficiency being made up by importations from France and the Baltic. Barley, some years ago used for bread, is now chiefly employed in malting; it sells for about 12*s.* the Guernsey bushel (55 lbs. English). Oats and rye are little grown; but parsneps, beet-root, and potatoes are extensively grown. The principal manure is *straw*, a kind of sea-weed, gathered by the people twice a year. With the exception of draining marsh-lands, several hundred acres of which have been brought into cultivation, the art of tillage has been stationary here for many years. Garden produce forms a main part of the cottager's subsistence. Melons, figs, peaches, and even oranges are abundant. The breeding of cattle is the most profitable branch of farming: the price of Guernsey cows varies from 10*l.* to 16*l.* according to their excellence, and they yield about 7 lbs. of butter weekly. The cows, which are milked 3 times a day, are universally tethered; about 14 acres being reckoned sufficient for the support of each. The law forbidding the importation of foreign breeds is strictly enforced; and thus the purity of the native race is maintained. Hogs are numerous, and of great size; sometimes attaining from 50 to 80 stone weight.

The trade of Guernsey is very inferior to that of Jersey, and has greatly decreased since the French war. In 1839 there were 98 ships, burden 10,025 tons. Before the introduction of the bonding system, Guernsey was used by merchants as a *dépôt* for foreign wines and other goods; besides which it had a most extensive smuggling trade, which, however, has now wholly ceased. The shipping is at present chiefly employed in exchanging the wines of Spain and the Mediterranean for the sugar, coffee, spices, &c. of S. America, which they take to Hamburg or Rotterdam, and again exchange for corn. The exports consist chiefly of cider, apples, potatoes, building-stones, and wine; the imports are wheat and flour, British manufactures, wine, sugar, coffee, &c. (For particulars, see *JERSEY*.) There are some manufactures in Guernsey of cement, bricks, cordage, paper, and soap; but all on a small scale.

The military government of the island is vested in a lieutenant-governor, who represents the sovereign in the assembly of the States. The legislative body, called the States, is composed of the bailiff, the procurer or attorney of the royal court, 12 jurats, the rectors and constables of parishes, total 32; and of these the first two are appointed by the crown, and the rectors by the governor; while the jurats and constables are chosen by the islanders. The States vote money for ordinary public expenses; but new taxes must be sanctioned by the crown: indeed, all new laws and constitutional changes can be effected only by application to the privy council. The "Royal Court," the supreme tribunal, consists of a bailiff appointed by the crown, and 12 jurats elected by the people. The language spoken in court is French. Jurats are not known; and the powers of the court are extensive, undefined, and sometimes oppressively used. Guernsey is a deanery, in the diocese of Winchester, and comprises 8 livings; but as the great tithes belong to the government, the clergy are wretchedly paid, and have little personal influence.

The natives of Guernsey, like those of Jersey (both of whom, in the lower ranks, speak a Norman patois), are thrifty, parsimonious, clean and neat in person and dress, simple in their manners, and generally honest. They are, many still believing in witchcraft. The establishment, however, in every parish has greatly raised the moral feelings of the lower orders: these schools have been repaired, and are partly supported by public money. Queen Elizabeth's college, founded in 1663, and greatly enlarged in 1824 at an expense of 16,000*l.*, is now in a flourishing state, and furnishes a first-rate classical and scientific education to about 200 students, at an expense of about 12*l.* a year each. The improvement of this establishment is conducing materially to the prosperity of

* Many vessels called under Peruvian colours for better protection during the revolution in 1824. There is an excellent account of Guayquil in *Stevenson's Peru*, ii. cap. 7.; see also *Sup. to Commercial Dict.*

the island, both by its direct influence on the natives, and by bringing new residents from England.

The only considerable town of Guernsey is Peter-le-port, its cap. situated on the E. side of the island. Pop. in 1831, 11,000. Being built on the slope of a hill, it looks well from the sea, but the streets, except in Hauteville, the modern and best built quarter, are narrow, steep, and crooked, lined with old and very lofty houses. The chief buildings are, the government-house, Queen Elizabeth's college, the court-house, the town hospital, and a handsome fish market. The par. church was built in 1312. The harbour, formed by two piers, is considered sufficient for the trade of the place, and there is good anchorage in the roadsstead. Fort George, a strong fortress, stands $\frac{1}{2}$ m. S. of the town. Guernsey, as well as the other channel islands, was included in the duchy of Normandy, which once belonged to Great Britain. The French have made several attempts to capture it, but without success. The last was in 1780. (*Angla's Channel Islands; Journal of Educ.*, vol. vii. &c.)

GUIANA, GUYANA, or GUAYANA, an extensive region of S. America, embracing, in its widest acceptation, all the territory between the Amazon and Orinoco, and extending between lat. 4° S. and $8^{\circ} 40'$ N., and long. 50° and 60° W. By far the greater portion of this region (formerly called Spanish and Portuguese Guyana) belongs to the Venezuelan and Brazilian territories; and the term Guiana is now generally understood to refer only to the country between lat. 0° $40'$ and $8^{\circ} 40'$ N., and long. $57^{\circ} 30'$ and 60° W., divided among the English, Dutch, and French.

GUIANA (BRITISH), is the most westerly portion of the above territory, and the largest, if we include within its limits the entire territory claimed by the British. The latter extends between lat. $0^{\circ} 40'$ and $8^{\circ} 40'$ N., and between the 67th and 61st deg. of W. long., having E. Dutch Guiana, from which it is separated by the Corentyn; S. Brazil; W. Venezuela; and N. and N.E. the Atlantic. This territory is supposed to comprise about 76,000 sq. m.; but of this a disputed portion, claimed by Brazil and Venezuela, amounts to not less than 64,000 sq. m., leaving only about 12,000 sq. m. for the area of the undisputed British territory. The latter has the Corentyn on the E., and the Essequibo on the W. Its subdivisions, pop., &c., are as follows:—

Counties.	Population (1834).				Chief Towns.
	Whites.	Free-colord.	Apprentices.	Total.	
Demerara	3,006	6,300	65,556	74,992	Georgetown.
Essequibo	570	1,651	19,359	21,589	New Amsterdam.
Berbice					
Total	3,576	8,011	84,915	96,502	

Mr. Schomburgk estimates the present (1840) pop. at 98,000, exclusive of 17,000 aborigines.

Physical Geography.—An alluvial flat extends from the coast inland, to a breadth varying from about 10 to 40 m., terminating at the foot of a range of sand hills, from 30 to 120 ft. high. Parallel with this range run several detached groups of hills, seldom more than 300 ft. high, which cross the Essequibo in lat. 6° $15'$, being continuous with the Sierra Imataca in Venezuela. About lat. 5° a mountain chain, composed of granite, gneiss, and other primitive rocks, an offshoot of the Orinoco mountains, runs W. to E. through Guiana, forming large cascades where it is crossed by the bed of the river, and rising frequently to the height of 1,000 ft. above the ocean. About a degree farther S. are the Pacaraima mountains, which in a similar manner run W. and E., and are of primitive formation. This chain forms many rapids and cataracts in the larger rivers, and contains the sources of several rivers of secondary importance, including the Berbice and Massaroupy. Its highest point, M. Roraima, lat. $5^{\circ} 9' 30''$ N., long. $60^{\circ} 47' W.$, near the W. extremity of the territory claimed by the British, is 7,500 ft. high. The Conoco or Canucu chain, running S.E., connects the Pacaraima with the Sierra Acarai. The latter is a densely wooded chain of mountains, forming the S. boundary of Guiana, and the water shed between the basins of the Amazon and Essequibo. Mr. Schomburgk estimated the elevation of the highest summits of this chain at 4,000 ft. The Essequibo and Corentyn rise in it.

"The whole surface of the coast lands of British Guiana is on a level with the high water of the sea. When these lands are drained, banked, and cultivated, they consolidate, and become fully a foot below it. It requires, therefore, unremitting attention to the dams and sluices, to keep out the sea, one inundation of which destroys a sugar estate for 18 months, and a coffee one for 6 years. The original cost of damming and cultivating is fully paid by the first crop, and the duration of the crops is from 30 to 50 years; so that, though great capital is required for the first outlay, the comparative expense of cultivation is a mere trifle compared with that

of the (W. India) islands, notwithstanding that the expense of works, buildings, and machinery may be treble or quadruple, being built on an adequate scale for half a century of certain production." *Hillhouse on the Warou Land, &c., Geog. Journ.*, iv. 323.

Between the first and second chains of hills are some extensive savannahs, which approach the sea-shore E. of the river Berbice. S. of the Pacaraima chain and the Rupunony are others still more extensive, but not so well watered. In the latter region are situated the small lake of Amucu and the frontier settlement of Pirara. With the exception of these savannahs, and the swamps on the Berbice, the interior is mostly covered with hill-ranges and dense forests.

The greatest slope of the country is towards the N., in which direction run the principal rivers. The chief of these is the Essequibo, which rises in the Sierra Acarai, about 40 m. N. the equator, and discharges itself into the ocean by an estuary nearly 30 m. wide, after a course of at least 620 m. Its entrance is much impeded by shoals, and it is navigable for sailing vessels for only about 50 m. from its mouth. According to the volume of water, its current is more or less strong, but it is seldom more than 4 knots an hour, even during the rainy season. The Corentyn rises about lat. $12^{\circ} 30'$, and long. 57° , and discharges itself also by an estuary 30 m. wide. Between the two rivers run the Berbice and the Mazaruni; the former may be ascended for 165 m. by vessels drawing 7 ft. water; the latter is navigable for 85 m. above Georgetown, which is situated near its mouth. The Mazaruni, Cunyuni, &c., affluents of the Essequibo, are the other principal streams. All the large rivers bring down great quantities of detritus, which being deposited around their mouths and estuaries renders the whole coast shoal. For 12 or 15 m. seaward the mud bottom is covered by only 3 or 4 feet water.

Geology and minerals.—The deposits around the coast consist of two deep strata of strong clay of different kinds, alternating with others of sand, and beds of small shells; and these again upon a granitic formation, which begins to appear on the surface in the second chain of mountains. The granite rocks in the interior often assume the most imposing and singular forms; mural precipices, with cascades 1,400 or 1,500 ft. high descending over them; granite boulders of huge size, spread over extensive tracts, &c.; and in lat. $2^{\circ} 55'$ is a natural pyramid, called the *Atarapua*, wooded to the height of 350 ft., and rising from that limit to an elevation of 900 ft. Mr. Schomburgk gives a sketch of this pyramid in the *Geog. Journ.*, x. 103. The other chief rocks are porphyry, and various kinds of trap, gneiss, claystone, sandstone, coloured ochres, &c.; there is a total absence of limestone, and its modifications. Traces of iron are frequent, but none of the precious metals has been discovered. Next to granite, excellent pipe and other clays are the most valuable mineral products.

Climate.—The mean temperature of the year at Georgetown is 81° on the Fahr., the maximum 90° , the minimum 74° on the coast. Two wet and two dry seasons constitute the changes of the year. The great dry season begins towards the end of August, and continues to the end of Nov., after which showers of rain follow to the end of Jan.: the short dry season then commences, terminating about the middle of April, when the rains begin to descend in torrents, and the rivers to inundate their banks. The winds during the rains are generally westerly; in the dry season they blow mostly from the ocean, particularly in the day-time. Hurricanes are unknown, gales unfrequent; thunder-storms occur at the changes of the seasons, but, like a few occasional shocks of earthquakes, are not attended with danger. The low and swampy coast-lands are unhealthy, but the interior is quite otherwise; and the insalubrity of Georgetown, and other sea-port towns, has been greatly aggravated by the quantity of refuse suffered to collect and decompose on the shore.

Vegetable products.—The forests abound with trees of immense size, including the *mora crocea*, algar or green-heart, and many others, yielding the most valuable timber, and an abundance of medicinal plants, dye-woods, and others of excellent quality for cabinet-making. Arnatto, so extensively used in the colouring of cheese, grows wild in profusion on the banks of the Upper Corentyn. That magnificent specimen of the American Flora, the *Victoria Regia*, was discovered by Mr. Schomburgk, on the banks of the Berbice. (*Geog. Journ.*) Another indigenous plant deserving of mention, is the *Assa-ary*, a papilionaceous vine, the root of which contains a powerful narcotic, and is commonly used by the Indians in poisoning waters to take the fish. The Indians beat the root with heavy sticks, till it is in shreds, like coarse hemp; they then infuse it, and throw the infusion over the area of the river or pool selected. In about 30 minutes, every fish within its influence rises to the surface, and is either taken by the hand or shot with arrows. A solid cubic foot of the root

will poison an acre of water, and the fish are not thereby deteriorated. (See *Hilhouse*, in *Geog. Journ.* iv.)

Wild Animals. — The jaguar, puma, pecari, and wild hog, tapir, many kinds of deer, &c., abound in Guiana: the sea-cow is met with in the larger rivers, which are also inhabited by the cayman, alligator, and guana. There are several kinds of formidable serpents, but they are fortunately of a sluggish and inactive nature. The birds have the most magnificent plumage. Turtles are plentiful. The rivers teem with fish, the low-lying, a species of *silurus*, often weighs from 300 to 300 lbs. The insect tribes are not excessively annoying.

Resources and Industry. — The property annually created by the products of the soil, trades, manufactures, &c., is estimated at 3,789,160*l.*; the value of the public and private property, movable and immovable, at 24,020,000*l.* The staples of the colony are at present sugar, coffee, and cotton; the two latter were formerly almost exclusively grown, but their culture is now in a great measure superseded by that of the sugar-cane.

The following is a statement of the quantities of the staple products raised in the colony from 1832 to 1838 inclusive.

Articles.	1832.	1833.	1834.	1835.	1836.	1837.	1838.
Sugar (lbs.)	96,381,950	99,106,487	81,085,483	107,586,405	107,806,949	99,851,195	88,664,835
Rum (gallons)	2,980,594	2,516,178	2,631,630	2,743,687	2,960,896	1,975,890	2,068,560
Molasses (do.)	4,609,473	5,121,301	3,288,688	3,105,421	4,335,569	5,405,906	3,139,675
Coffee (lbs.)	6,410,535	4,890,696	5,035,556	3,065,743	6,875,732	4,066,300	3,143,343
Cotton (do.)	1,157,709	354,307	326,944	367,743	656,978	905,300	84,920

The coast regions are the only parts cultivated for sugar; but many tracts in the interior seem to be equally well fitted for that purpose; coffee, also, is grown only on the coast, but, according to Mr. Schomburgk, no tract appears better suited for it than the central ridge of the mountains. The Indians have generally some indigenous cotton growing round their huts, and among the Macacis (on the Rupituni) it is raised to a considerable extent. It comes to perfection in most parts of the colony; but is cultivated by the colonists only on the coast, and even there it has of late been nearly abandoned, the planters being undersold by those of the U. States. There are numerous other products, which as yet neither form articles of export, nor of internal consumption, for which both the soil and climate are suitable, and which might be raised with advantage, were it not for the want of labour. Amongst these are rice, maize, Indian millet, Victoria wheat, cocoa, vanilla (a native of Guiana), tobacco, cinnamon, &c. Between the Berbice and the Essequibo there is a tract of many thousand acres, possessing the means of constant irrigation, on a small portion of which 3 crops a year have been repeatedly raised; but at present it is nearly all a complete wilderness, and will so continue till labour becomes more abundant and cheaper. The coast region, which is covered by a deep layer of vegetable mould, forming what is called a *prague* soil, is so extremely fertile that 6,000 and even 8,000 lbs. of sugar, and from 20,000 to 30,000 lbs. of plantains, are sometimes produced on an acre; but in order to cultivate this soil, dams and embankments as before stated are necessary, and agriculture is conducted at a great outlay, and on large estates.

In the article AMERICA (p. 83.), notice has been taken of the vast increase of the horses and cattle carried thither from Europe. Large herds of both wander wild on the wide but ill-watered savannahs beyond the Essequibo; and, with little exception, have hitherto afforded food only for beasts of prey. The savannahs between the Berbice and Demerara occupy upwards of 3,000 sq. m.; they are clothed with nutritious grasses, plentifully irrigated, and interspersed with shady woods. Were these stocked with cattle from the interior,

beef might be obtained as cheaply as in the U. States. From 1,800 to 2,000 individuals, 7-10ths Indians, are employed in cutting timber, which is in great demand within the colony, though its export has hitherto been very trifling.

Since 1837, there has been a rapid decrease in the quantities of the staples grown and exported; the exports of 1838, as compared with those of 1836, presenting the enormous deficiency of nearly 4,150,000*l.* Different circumstances have probably conspired to bring about this result; but there can be no manner of doubt that it is mainly ascribable to the nature of the climate, and the aversion of the emancipated negroes to *stere* labour. It is, indeed, not a little surprising, that any other result should have been anticipated from their emancipation. It was also but contradictory and absurd to suppose that people with few wants, occupying a soil of great natural fertility, lying under a burning sun, should voluntarily and heartily engage in labour, which is both *severe*, and associated in their minds with the most degrading recollections. We believe, indeed, that it will be found wholly impossible, except under peculiar circumstances, to carry on the culture of sugar on its present plan, in tropical countries, by the agency of *really* free labourers. Hayti, formerly the most important and productive of all the sugar colonies, does not now produce a single pound weight of sugar *l* and such, most probably, would also be the case in Cuba and Brazil, were the blacks really free. In 1839, about 400 Hill coolies were imported from Hindostan into Guiana; and they are said to be quiet, useful labourers. But it was suspected, and we believe with good reason, that this was, in effect, a revival of the slave trade; and the practice has in consequence been discontinued. At present, therefore, many thousand acres of the most fertile soil are lying waste for want of hands. Mr. Schomburgk reports that the number of abandoned negroes in the colony amounts to 58 out of 80 *l* (p. 136.) Manufactures can hardly be said to exist.

Commerce. — The following is an account of the quantities of the staple products of British Guiana, imported into the U. Kingdom during each of the 6 years ending with 1839.

Articles.	1834.	1835.	1836.	1837.	1838.	1839.
Sugar (cwt.)	777,971	888,861	1,077,848	945,388	835,300	666,852
Rum (gallons)	1,231,970	1,990,656	2,004,588	1,482,139	1,508,946	1,442,550
Molasses (cwt.)	805,666	227,007	264,206	239,824	255,477	117,238
Coffee (lbs.)	3,527,648	3,166,091	3,467,442	5,118,442	799,298	1,673,322
Cotton (do.)	1,868,789	1,440,361	1,090,597	309,217	653,629	651,329
Arrowroot (do.)	6,548	9,973	10,009	1,904	6,732	255

The total value of the exports which, in 1836, amounted to 2,135,579*l.*, in 1839 amounted to only 986,013*l.* Nearly the whole are sent to Great Britain or to British America and the W. Indies. The value of the British and foreign goods imported during each of the 5 years ending with 1836, was as follows:—

	1832.	1833.	1834.	1835.	1836.
British	£ 336,999	£ 391,880	£ 463,451	£ 511,361	£ 911,577
Foreign	234,986	166,054	390,177	103,745	292,985
Total	571,985	557,934	853,628	615,106	1,204,562

In 1836 716 ships, of the burden of 111,425 tons, entered; and 798, of the burden of 116,005 tons, cleared out. There are at present 4 steamboats in the colony, the largest, of 90 horse-power, plying between Georgetown and New Amsterdam. A railway from the cap. to Mahalia has been projected. There are about 250 m. of public roads. Dutch and English measures, and Spanish, Dutch, and English money are in use.

Government, &c. — The government is vested in a governor, and a court of policy consisting, besides the governor, of the chief justice, attorney-general, collector of the customs, and government secretary, and an equal

number of unofficial persons elected from the colonists by the college of electors. This college is a body of 7 members, appointed by the inhab. for life, whose qualification is the payment of taxes to the amount of 5*l.* sterling a year. The unofficial members of the college of policy serve for 3 years, and go out by rotation. There is a college of financial representatives of 6 members, with the same qualifications as the members of the college of electors, chosen by the inhab. for 3 years. The court of policy decides on all financial regulations; but when they have prepared an estimate of the expenses for the year, and the mode of taxation and the different items have been discussed and acceded to by a majority, the estimates are handed over to the financial representatives, who, in concert with the court of policy, examine the charges. In the combined court every member, whether of the court of policy or financial representatives, has an equal vote. The court of policy, combined with the financial representatives, having approved of and sanctioned the ways and means, they are passed into a law. The governor not only has a casting vote, as president of the court of policy, but an absolute veto on all laws passed by a majority. The king in council may enact or disallow any law passed in the colony. The supreme civil court consists of a chief judge, 3 puisne judges, a secretary, registrar, and accountant. It is

a court of appeal from the rolls court in each co., in which one of the judges of the supreme court presides. The laws of Holland, but particularly the laws, statutes, and resolutions of the states-general, are followed by the judges of the court in giving judgment. Appeal from the supreme court, in matters above 500*l.*, lies to the king in council. The supreme criminal court is composed of 3 civil judges and 3 assessors, chosen by ballot. Its judgments are decided upon by a majority of votes, and are delivered in open court. Inferior criminal courts are held by the sheriffs of each county, with whom 3 magistrates are associated. Special magistrates, appointed from England, decide between the masters and labourers in the different districts; 3 superintendents of rivers, and 6 post-holders are appointed for the protection of the Indians in the interior. There are at present 18 ministers of the church of England, 2 of that of Holland, 6 Rom. Catholic, 6 of the church of Scotland, and several of protestant dissenting sects. The provision for the different religious establishments in 1839, amounted to 92,942*l.* In 1838, 11,363 persons were receiving instruction in the public schools. The military force consists at present of one regiment of the line, and a detachment of another. The colonial militia has been disbanded.

The public revenue is derived from taxes on produce; on incomes of 500 dollars and upwards; on imports not of the origin or manufacture of Great Britain; and from assessed taxes on houses, carriages, wine and spirit licenses, &c. In 1836, it amounted altogether to 165,081*l.*, and the expenditure to 118,942*l.* The portion of the 30 millions sterling falling to this colony, as compensation for the freedom of slaves, amounted to 4,269,809*l.*

The only towns worthy of mention are Georgetown and New Amsterdam. Georgetown, formerly Stabroek, the cap. and seat of government, is on the E. bank of the Demerara, near its mouth; lat. 6° 49' 20" N., long. 58° 11' 30" W. Pop. about 20,000, of whom 16,000 are coloured. (*Schomburgk*, 73.) Except Water-street, which is built close to the river, the streets are wide, and traversed by canals; the houses are of wood, seldom above 2 stories high, shaded by projecting roofs, having verandahs and porches, and surrounded by gardens separated by trenches. An edifice facing the river, built of brick and stuccoed, which cost the colony upwards of 5,000*l.*, comprises all the government offices: near it are the Scotch church, market-house, and town guard-house. Within a mile of the town, near the mouth of the river, is Fort William Frederick, a small mud fort. A handsome Gothic church, to cost 13,000*l.*, is now in course of erection at Georgetown; another episcopal church stands on the parade ground, besides which it has a Rom. Catholic cathedral, Wesleyan chapel, 3 public an infant and a patch school, a colonial hospital, an excellent seaman's hospital, a savings' bank, 2 commercial banks, and an amateur theatre. Shops and stores are numerous, and European goods of all kinds plentiful; no duty being laid on English merchandise. The markets are good, and a new market-house is being erected. New Amsterdam, on the Berbice, in lat. 6° 15' N., long. 57° 27' W., extending about 14 m. along the river, is intersected by canals, and has about 3,000 inhab. It has English, Scotch, and Dutch churches, Rom. Cath. and Wesleyan chapels, a free school, court-house, barracks, fort, many commodious wharfs and warehouses, and 2 commercial banks. It is less unhealthy than Georgetown.

History.—According to some, Columbus discovered Guiana in 1498: others give that honour to Vasco Nunes, in 1504. The Dutch, who were its first European settlers, established some settlements near the Pomeroon and elsewhere in its neighbourhood, in 1580, and several further to the E. a few years afterwards. The English began to form settlements about 1630. Most of Guiana, however, remained in the hands of the Dutch till 1795; when Demerara and Essequibo surrendered to the English. They were restored to the Batavian republic in 1803; and re-taken by the British in 1803. The territory called British Guiana has belonged to us ever since that period; that called Dutch Guiana was given up to Holland at the conclusion of the late war. (*Schomburgk's British Guiana*; *Schomburgk, Hilhouse, &c.*, in *Geog. Journ.*, vol. ii. li. vi. vii. x.)

GUIANA (DUTCH). This territory is intermediate, both in size and position, between British and French Guiana. It extends between the 3d and 6th deg. of N. lat., and the 53d and 57th deg. W. long., having E. French Guiana, from which it is separated by the Marony, S. Brazil, W. the Corentyn, which divides it from British Guiana, and N. the Atlantic. Length, N. to S. 260 m.; average breadth, about 155 m. Area about 38,500 sq. m. (*Statist.*) Pop., exclusive of Indians and Maroons, probably 65,000, of whom 6,000 are whites or free coloured people, chiefly Dutch, French, and Jews, and the remainder negro slaves. The Maroons of the interior are the descendants of runaway negroes, and

were very troublesome during the past century; they have now, however, adopted much more settled habits than formerly, and receive annual presents of weapons, arms, &c., from the Dutch, the territory they occupy forming a kind of military frontier to the colony. The physical geography, climate, productions, &c., of Dutch Guiana, are pretty much the same as those of the British colony above described. All the rivers have a N. direction; the chief is the Surinam, which runs through the centre of the country, and falls into the Atlantic, after a course of nearly 300 m. It gives its name to the N. portion of the territory, and is navigable for large ships for about 4 leagues from the coast. Paramaribo is situated near its mouth. About 50 ships are employed in the transport of the produce of the colony to Europe. Sugar is the chief staple, and about 25,000,000 lbs. are produced annually; the export of coffee may be estimated at about 4,000,000 lbs. a year; cocoa, cotton, rice, cassava, yams, &c., are also grown in considerable quantities; and plentiful supplies of various descriptions of timber, and of woods for cabinet work with gums, balsams, and other drugs, are procured from the interior. Provisions, arms, and manufactured goods are imported from Holland: provisions are also imported from the U. States, to which the exports are syrup and rum: there is some commerce with the W. Indies, and a smuggling trade is carried on with Colombia. The government is vested in a governor-general and a high council. The cap. and seat of government is Paramaribo, a town of 20,000 inhab., three fourths of whom are blacks, or of mixed descent. It is nearly laid out in the Dutch style, and has R. Catholic, English, and Lutheran churches, a German, and a Portuguese Jewish synagogue an exchange, &c., and is the centre of the trade of the colony. The fort of Zeelandia, a little N. of the town, is the residence of the governor, and the seat of most of the government establishments.

GUIANA (FRENCH).—This, which is the most E. and smallest division of Guiana, lies between the 2d and 6th deg. N. lat., and 51d and 54d deg. W. long., having E. and S. Brazil, W. Dutch Guiana, and N. and N.E. the Atlantic. Length, N. to S., 250 m.; breadth varying from 100 to 190 m. Area, 27,660 sq. m. Pop., in 1837, free 5,656, slaves 16,592, total, 21,648, ex. Garrison, and colonial functionaries.

The coast plain (*basos terres*) is an alluvial tract of extreme fertility, interspersed with a few isolated hills, apparently of volcanic origin, and some ranges of low hillocks. The uplands (*terres hautes*) are also very fertile, their soil being generally argillaceous, more or less intermixed with granite, sand, and tufa, and in some parts highly ferruginous. The mountain chains run E. and W.; they are almost wholly granite, but no where reach any great elevation; in the centre of the colony they rise from 1,600 to 2,000 ft. above the level of the sea. Few countries are more abundantly watered. There are upwards of 20 rivers of tolerable size, all of which have a N. course. Their mouths are obstructed by sand-banks, and do not admit of the entrance of vessels drawing more than 12 or 15 ft. water; they cease to be navigable, except for canoes, at a distance of from 45 to 60 m. inland. In the rainy season they inundate the low country to a great extent, but are then innavigable from their rapidity. The coasts are low, and, except at the river mouths, ships cannot approach the shore. There is only one roadstead, that of Cayenne, where vessels can ride in security. Several small rocky or wooded islands lie off the coast, among which is Cayenne, at the mouth of the Oiapoko, on which the cap. is built. The climate is similar to that of British Guiana (which see); but the coast lands appear to be less unhealthy. About 50 or 60 m. from the coast the country begins to be covered with vast forests. The low lands are in a great part uncleared, and covered with underwood. The settled and occupied lands were dispersed in 1836 over a surface of 230 sq. leagues, or about 1-80th part only of the whole surface of the colony, the rest of which is tenanted by wild beasts and roving Indians. The cultivated lands, slaves employed on them, and amount of produce at the same period, were thus estimated:—

Articles cultivated.	Hectares under cultivation.	Slaves employed in cultivation.	Produce and Quantities obtained.
Sugar-cane	1,571	4,932	Raw sugar 3,422,796 kil. Syrup & trade 583,082 ib. Rum 48,000 —
Coffee	180	280	280,000 —
Cotton	3,745	2,968	280,000 —
Cloves	127	174	25,000 —
Aracato	1,760	2,693	81,000 —
Pepper	275	237	25,000 —
Cassia	9	—	600 —
Nutmeg	—	—	315 —
Corn, &c.	4,251	945	to the value of 945,000 fr.
Total	11,896	15,727	

The sugar-cane was introduced by the earliest colonists, and its culture has been greatly extended since 1829; it is grown only on the low lands, where the mean annual produce of a hectare of good soil is estimated at 2,000 kilogr., worth about 1,000 fr. There are from 30 to 40 large establishments for the manufacture of sugar, and in all about 60 sugar-mills, 27 of which were, in 1836, worked by steam. Coffee is very inferior to that of the W. Indies, and its culture has rather diminished of late years. Cotton, cocoa, arnatto, and vanilla, are indigenous. In the low lands, from 228 to 350 kilogr. per hectare is the mean annual produce of cotton. The clove succeeds pretty well, especially on the uplands; other spices have met with only doubtful success. Cocoa is unfit for the French markets, and most of what is grown is exported to the U. States: indigo and tobacco are of very inferior quality. Manioc, rice, maize, bananas, &c., are grown, but the quantities produced fluctuate greatly, and are often insufficient for home consumption. In 1837 there were about 12,000 head of live stock, principally black cattle. Manufactured goods are imported from France. Building docks for small vessels, employ about 170 slaves; and there are several brick and tile-yards. The price of an artisan's labour varies from 3 to 6 fr. a day. The trade is increasing: in 1836, the value of the imports from France and her colonies amounted to 2,675,162 fr., and those from foreign countries to 569,358 fr., making a total of 3,244,519 francs. The principal articles exported, and their value, in the same year were as follows:—

Articles exported (1836).	Quantities.	Value.
Sugar (raw) - - - -	2,949,417 kilog.	1,534,583 fr.
Molasses - - - - -	473,008 -	69,995 -
Cocoa - - - - -	24,323 -	36,500 -
Coffee - - - - -	38,389 -	30,389 -
Cloves - - - - -	82,632 -	280,694 -
Pepper - - - - -	29,434 -	40,368 -
Wood for cabinet-making -	51 -	180,000 -
Cotton - - - - -	250,691 -	513,592 -
Arnatto - - - - -	289,837 -	804,145 -
Rum - - - - -	57,705 litres	28,766 -

The total value of the exports amounted to 3,121,753 fr., nearly the whole being shipped for France or her colonies. Forty-two French vessels, of the aggregate burden of 6,792 tons, entered; and 45 of the burden of 7,950 tons, left the colony in 1836, besides which 22 foreign vessels entered, and 19 departed.

French Guiana is divided into 2 districts, those of Cayenne and Sinnamary; and 14 communes, composing 6 electoral arrondissements, and sending 16 deputies to the colonial council. Cayenne, the seat of government (which see), is the only town worth notice. The government is vested in a governor, assisted by a privy council of 7 of the highest official functionaries; and the colonial council, composed of 16 members, elected for 5 years, by inhab. of French descent, 25 years of age, born, or having resided in Guiana for 2 years, and paying direct taxes to the amount of 200 fr. a year, or the possessors of property to the value of 20,000 fr. Number of electors in 1836, 211. The public revenue, derived chiefly from taxes on slaves and domestics, house taxes, customs, export duties, patents, licences, passports, sale of government lands, rents, fees, fines, &c., amounted, in 1837, to 255,222 fr.; the colonial expenditure in the same year was 1,446,710 fr.

Some French adventurers first settled at Cayenne in 1604; and with only a few short interruptions from the Dutch and English, the French held that station and the rest of the colony till 1809: it was then taken possession of by the English and Portuguese, and held by the latter till 1818, when, in pursuance of the Treaty of Paris, it was restored to France. (*Notice sur les Colonies Françaises*, Hugo, &c.)

GUIENNE, one of the provs. into which France was divided previously to the Revolution. It was situated in the S.W. part of the kingdom, on both sides the Gironde; and is now distributed among the depts. of the Gironde, Lot-et-Garonne, Dordogne, Lot, and Aveyron.

GUILDFORD, a parl. bor. and market town of England, co. Surrey, of which it is the cap., hund. Woking, on the Wey, 27 m. S.W. London. Pop. of the town (1881), 4,688. Guildford, as seen from the W., has an imposing appearance, being principally situated on the declivity of a chalk down, at the foot of which runs the Wey, crossed by a bridge of five arches. It consists chiefly of one long, broad, and well-built, but inconveniently steep, street, which is crossed by several other streets of inferior dimensions. "It has the appearance of a well-conditioned place, and may be expected to increase." (*Boundary Report*.) It is well paved, lighted with gas, and supplied with water forced up from the river. It has 3 par. churches, all ancient structures; a handsome co. hall, town-hall, council-chamber, a gaol, rebuilt in 1765; chapels belonging to Baptists, Presbyterians, Quakers, Rom. Catholics, &c.; a large free grammar-school, founded by Edward VI., with an en-

dowment for a scholar at Cambridge and at Oxford; a charity-school, at which 25 boys are educated and 3600; and a theatre. Guildford was a residence of the Anglo-Saxon kings, and the ruined keep of a castle, consisting of a quadrangular tower, 70 ft. high, and built of flint, ragstone, and Roman bricks, forms a picturesque object at the S. extremity of the town. The traces of an ancient palace are also clearly discoverable. Since the passing of the Municipal Corporation Reform Act, Guildford has been governed by 4 aldermen, one of whom is mayor, and 12 councillors. Petty sessions are held here, and the assizes in the summer circuits here and at Croydon alternately. Guildford has sent 2 mems. to the H. of C. since the time of Edward I. Previously to the Reform Act, the right of voting was in the freeholders and free-men resident in the town, paying scot and lot. The Boundary Act considerably extended the limits of the parl. bor., which had, in 1831, a pop. of 4,383. Registered electors, in 1839, 421. Corporation revenue (1839) 1,993. Guildford has a considerable trade with the metropolis in corn, timber, malt, &c., sent to London by the Wey. Market-day, Saturday, for corn, and other commodities. Fairs, May 4 and Nov. 22, for horses, cattle, &c.

GUILSBOROUGH, or GUISBOROUGH, a market town and par. of England, co. York, N. Riding, E. div., Langborough lib., 39 m. N. York, and 21 m. E. Darlington. The par. comprises 5 townships: area of township of Guilsborough, 6,120 acres; pop. of do. in 1831, 1,988. The town stands in a small but beautiful and very productive valley near the river Tees, and at the foot of the Cleveland hills. It consists of one single wide and handsome street, lined with old but substantial houses. The church is a modern edifice, supposed to occupy the site of one attached to the Austin Priory, established here in 1129, some ruins of which still remain in the meadows S. of the town. In the church-yard are the grammar-school and hospital, founded by the last prior, and chartered by Queen Elizabeth, in 1561. The rental of the property, according to Carlyle (il. 80th.), is 376*l*. Ten scholars are taught gratuitously, and 15 others for a payment of 5*s*. per quarter. The master's salary is 60*l*. with a house and garden. The hospital lodges and clothes six old men and six old women, and gives them a money allowance for food and coals. Guilsborough is a quiet country town, with little trade, except on Monday, the market day, and its six fair days (last Tuesday in April and May, third Tuesday in May, Aug., and Sept., and second Tuesday in Nov.). It used, however, to have a considerable trade in alum, and the first alum-works in England were begun here about 1500. This mineral is worked in some of the neighbouring parishes, especially Loftus; but it has for many years ceased to be a branch of industry at Guilsborough.

GUIMARAENS, a town of Portugal, prov. Entre Duero-y-Minho, cap. of a comarca of same name, 28 m. N.N.E. Oporto, and 196 m. N. by E. Lisbon; lat. 41° 24' N., long. 8° 14' W. Pop. 8,260. (*Mitlano*.) It is built on a slight elevation in the midst of a beautiful and productive plain between two small rivers, the Ave and Visella, and is surrounded with fortifications. The streets, which are wide and straight, are lined with well-built houses, and there are several handsome *paços*, or squares. Among the public buildings are 4 churches, one of which is collegiate, and remarkable for its fine architecture: there are also 5 convents and 4 hospitals. It has some small manufactures of cutlery, hardware, and linen. There are thermal springs in the neighbourhood, which were known to the Romans. The ancient town is said to have been founded, anno 800 a.c., under the name of Araducia: the modern one was the first capital of the Portuguese monarchy. (*Mitlano*; *Baldi*; *Stat. de Portugal*.)

GUINEA, a name applied by European geographers to designate a portion of the W. coast of Africa. The origin of the word is not certainly ascertained, nor are writers agreed respecting the limits of coast to which the name should extend. D'Anville, and the older geographers, apply it to the line of coast from the mouth of the Gambia to that of the Quorra; whereas Ritter, and the more modern authors, extend its confines from C. Verga, lat. 10° 30' N., to the mouth of Nourse's river, lat. 17° S., and call the district S. of C. Lopez, lat. 5° S., comprising Congo, Angola, and Benguela, by the name of S. Guinea; while under N. Guinea, or Guinea Proper, are comprehended Sierra Leone, Liberia, the Grain and Ivory Coast, *Sabantes*, Dahomey, Benin, and Biafra. The description of this extensive line of coast, for which we are chiefly indebted to the discoveries of *Bonodick*, *Adams*, *Ileri*, and *Tuckey*, will be found under the heads of the countries above mentioned.

GUINGAMP, a town of France, dép. Côtes-du-Nord, cap. arrond., in the Tricuit, in an extensive plain, 17 m. W.S.W. St. Briec. Pop. (1836) 6,466. It was formerly surrounded with walls, parts of which still exist; a spacious street intersects it from end to end, about

the middle of which is a singular par. church, with a square tower, surmounted by a dome. The town contains several good edifices, and is surrounded by agreeable walks. It has manufactures of the fabrics named from the town *ginghams*, linen cloth, thread, &c., and 13 fairs yearly, at which large quantities of corn, cattle, flax, hemp, and manufactured goods, are sold. (*Hugo, Dict. Geog.*)

GUJPUZCOA. See BISCAY.

GUJERAT, GUJRAT, or GUZERAT (*Gurjara Rastrtra*), an extensive prov. of W. Hindostan, chiefly between lat. 21° and 24° N., and long. 69° and 78° E.; having N. Rajpootana, E. Malwah and Candelah, S. Auranabad and the Gulph of Cambay, and W. the Indian Ocean, the Gulph of Cutch, and the Runn. It comprises the N. districts of the British presidency of Bombay, most part of the Gulcowar's dom., a part of those of Scindia and the rajah of Jondפור, and the territories of many smaller chieftains. Its length, E. to W., may be estimated at 300 m., by an average breadth of about 180. "The inhab. of this vast province are probably much under-rated at 6,000,000." (*Hamilton's E. I. Gaz.*) Gujerat is bounded on the N. and N.E. by steep and craggy mountains of difficult access, sending out many ramifications, the intervals between which are filled with jungle. Into this part of the prov. the Maharrattas were never able to penetrate; but they conquered the S. part, consisting of an open fertile plain, apparently level, but in reality intersected by numerous ravines and chasms, and watered by numerous rivers. The W. part consists of the Peninsula of Gujerat, stretching into the ocean between the Gulphs of Cambay and Cutch, about 190 m. in length, by 100 broad, and which forms the great nucleus of the Gulcowar's territories.

The N.W. part of the prov. is in part a swampy plain where it adjoins the Runn, and an arid desert continuous with that of N.W. India. The climate is oppressively hot in summer, but, in winter, temperate and agreeable. Mr. Elphinstone (*Parl. Rep.*, p. 188.) says that "Gujerat is the most flourishing country in India;" and though in parts there is a great deal of barren land, it is, upon the whole, one of the richest parts of Hindostan, both as respects its productiveness and the condition of its pop., a result which is mainly ascribable to the moderate assessment of the land both under the British and the native princes." (*See Parl. Rep.*, &c.) Of 1,452,000 acres in tillage in British Gujerat, it was estimated, some years since, that 187,730 were under cotton culture, 4,566 under sugar-cane, 1,523 under indigo, 10,760 under tobacco, and the rest appropriated to the growth of grains and garden produce. (*Appendix to Rep. on Public Rev.*, p. 286.) All the foregoing articles of growth are of excellent quality: indigo was, however, grown formerly to a much greater extent than now. Oil, hemp, flax, pulse, &c. are the other principal kinds of produce. In the British districts, nearly all the land is cultivated that is capable of yielding an adequate return; in some parts of the prov. there are fine pasture lands, on which many good horses and draught cattle are reared. The land is assessed on the village system, the tax being collected through the medium of *potils*, or head-men. (*See Revue Russe*, &c.) In the British territories, most of the land is occupied by permanent tenants: leasehold lands are few. There are also few landholders of any extent; and in Kattywar, property is very much subdivided. The inhab. are mostly Hindoos, amongst whom the Jain sect are more numerous than in any other prov. of India. The pop. is, however, extremely mixed, and includes numerous tribes of Grassias, Katties, Coolies, Bheels, Newassies, Bhattas, and other lawless races, who acted an important part during the wars of the Maharrattas, and other chieftains that long troubled this part of India. Many of these tribes still lead a roving life; but most of them have now adopted peaceful occupations. Besides its native tribes, Gujerat (with Bombay) is the chief seat of the Parsees, a people who emigrated from Persia in the 7th century, after the overthrow of the Sassanide dynasty by the Mohammedans. In 1816, the Parsees in Hindostan were estimated at 150,000 families. (For some details respecting them, see BOMBAY, p. 407.) The Mohammedans in Gujerat make about 10 per cent. of the pop. Almost all the castes of this prov. work at the loom occasionally, and cotton fabrics, sent in considerable quantities to Bombay, form, in fact, the chief export of the prov., after corn and raw cotton. The Surat manufactures, of various kinds, have long been famous for their cheapness and good quality. The principal imports of the prov. are sugar, raw silk, pepper, cocoa-nuts, cochineal, and woollen goods. During the period of its independence in the 16th and 16th centuries, Gujerat enjoyed a much more flourishing trade than at present; but there are still many rich native merchants in the town, the chief of which are Borat, Ahmedabad, Baroach, Baroda, Cambay, Gogo, Bhownagur, Champanser, and Junaghur. Gujerat was subjected by the Mohammedans under Mahmoud, of Ghazni, about 1025: from 1390 to 1573, it belonged to a native Rajpoot dynasty, which had revolted from the Mo-

guls; but at the latter date it fell into the hands of the Emperor Acher. After the death of Aurungzeb, in 1707, it was conquered by the Maharrattas, and remained a part of their empire till the destruction of their power by the British.

GUMBINEN, a town of the Prussian dom., prov. Prussia, cap. gov. of the same name, on the Pissa, 70 m. E. by S. Koningsberg. Pop. 6,355. It is regularly built, and has several churches, 3 hospitals, a public library, a gymnasium, and schools of midwifery, architecture, &c. It is the seat of the superior courts, and council for its gov., and has manufactures of woollen cloths and stockings, distilleries, breweries, and some trade in corn and linseed. Most part of its pop. are Protestants.

GUNDWANA, a large prov. of the Deccan, Hindostan, extending between lat. 18° and 25° N., and long. 77° 30' and 85° E.; having N. the provs. Malwah and Allahabad, E. those of Bahar and Orissa, S. the Northern Circars and Hyderabad, and W. Beeder, Berar, and Candelah. It comprises the N.E. portion of the table land of Central India, and is chiefly included in the dominions of the rajah of Berar (the Nagpore rajah) and the ceded and almost unexplored territories in the S.W. parts of the British presidency of Bengal. A large proportion of its surface is mountainous, and some of the largest secondary rivers of Hindostan rise within its limits; as the Nerbudda, Sone, Mahanuddy, &c., while the Warda and Godavery bound it W., but in general it is ill-watered, unhealthy covered with jungle, and thinly inhabited. The pop. consists chiefly of Gonds, apparently an aboriginal people, at a remote period partly conquered and converted by the Hindoos, and the remainder driven to the hills and jungles, where they live nearly in a state of nature, the country continuing to be for the most part a sort of primeval wilderness. Their broad flat noses, thick lips, and often curly hair, distinguish them from the other native tribes of Hindostan. Some are domesticated in the plains; where they make good agricultural labourers; those who live wild, on the contrary, have no agriculture, and subsist on roots, vegetables, bamboo-shoots, and whatever animal food they can obtain. Their own idols are of the rudest description, but they have also borrowed many objects of worship from the Hindoos, to which they offer up animal, and even human, sacrifices; in many parts, they divide themselves into castes, like the Hindoos, and have adopted various institutions and practices from them and the Mohammedans. Their language contains, amongst its elementary words, many of Teluga and Tamul origin. The chief towns in Gundwana are Nagpore, Sumbhulpoor, Deoghur, Mundlah, &c. Deoghur was formerly the seat of an extensive Hindoo empire; but the S. part of the prov. was included in the kingdom of Telingana, which, with Deoghur, afterwards constituted a portion of the Bhamenese empire of the Deccan: while the N. parts of the country were tributary to the Mogul emperors. There are, however, no remains in the prov. to indicate that it ever flourished as a highly civilised or cultivated country. (*Hamilton's E. I. Gaz.*)

GUSTROW, a town of N. Germany, G. D. Mecklenburgh Schwerin, cap. duchy of same name, on the Nebel, 31 m. E.N.E. Schwerin. Pop. 8,567. It is walled, has an anc. castle, now converted into a workhouse and house of correction, and several handsome public edifices, among which are, the cathedral, 2 other churches, the government house, &c. It is the seat of a court of chancery, and boards of taxation and police, and is a town of considerable commercial importance. It has between 50 and 60 manufactories of different kinds, including mills, breweries and distilleries. Two large fairs for cattle and wool are held yearly, at which wool to the amount of nearly 300,000 dollars is sold. (*Bergbau; Stein.*)

GWALIOR, a strong fortress and town of Hindostan, and the modern cap. of Scindia's dom., prov. Agra, 61 m. S.E. Agra, and 260 N.E. by N. Oojein; lat. 26° 18' N., long. 78° 1' E. It stands on a precipitous, isolated hill, close around the brow of which its defences of stone are carried. This hill is rather more than 1½ m. in length; but its greatest breadth does not exceed 300 yards; the height at its N. end is 342 ft. At this end is a palace; and about the middle of the fort are two remarkable pyramidal buildings of red stone, in the most ancient style of Hindoo architecture. The only gate is towards the N. extremity of the E. side; from which, by several flights of steps, you ascend to the top of the rock. Within the citadel there are large natural excavations, which furnish a supply of excellent water. The town, which runs along the E. side of the hill, is large, well inhabited, and contains many good houses of stone, which is furnished in abundance by the neighbouring hills. E. of the town runs the river Sooner, beyond which is a large Mohammedan tomb, a handsome stone building, with a cupola covered with blue enamel. There are numerous caves adjacent to the fort, said to contain many Buddhist sculptures. Gwalior, from its position,

must always have been a military post of great importance, but by no means impregnable; for it has frequently changed masters. It was taken by escalade, in 1780, by the British; but finally ceded, in 1808, to Scindia, and has since been the permanent residence of his court.

GYONGYOS, a market-town of Hungary, co. Heves, at the foot of the Matra mountains; 22 m. S.W. by W. Erlau, and 42 m. N.E. Pesth. Pop. about 14,700. (*Berg-haus*.) It has several churches, a Franciscan gymnasium, and a Rom. Catholic high school; manufactures of woollen cloth, leather, hats, brandy, &c., and a large trade in agricultural produce and cattle. Good wine is made in its vicinity.

GYULA, a market-town of Hungary, cap. co. Bekes, on the White Körös, 35 m. N.N.W. Arad. Pop. (1838) 13,752. It consists of two parts, Hungarian and German Gyula, separated by the river; it has a fortress, a county-hall, several churches, some oil-mills, and a large trade in cattle, &c.

H.

HAARLEM, or **HARLEM**, one of the principal cities of the Netherlands, prov. N. Holland, cap. arrond. and cant.; on the Spaarn, 10 m. W. Amsterdam. Pop. about 22,000. It is now in great part destitute of defences, but was formerly a place of some strength, having been fortified in the 16th century with brick walls, parts of which, with an old gateway, still remain. "Haarlem is, in external appearance, unlike most other Dutch cities. It has an ancient and somewhat dingy aspect. The architecture of some of the houses is remarkably picturesque, with sharp-pointed gables; and the roofs show several rows of small attic windows, like what one is accustomed to see in old Flemish pictures. The streets are arranged in an irregular manner, with cross alleys and back courts, and few of them have avenues in the centre, which is quite a singularity in a Dutch town." (*Chambers*, p. 26.) Mr. Barrow says it is "very well built, very clean, and very dull." Its pop. at present is greatly below what it formerly contained. It has a large paved market-place surrounded by several of the principal edifices of the city, as the church of St. Bavon, a vast Gothic structure, with a high square tower; the fish-market; the *Stadthaus*, a fine building, &c. Opposite the church is a statue of Laurence Coster, the reputed inventor of moveable types, a citizen of Haarlem. St. Bavon's has somewhat of a naked appearance inside; but its organ has long been considered one of the finest and largest in Europe. It is supported on porphyry pillars, and fills up the whole of one end of the church, reaching up to the roof. It has nearly 5,000 pipes; its tones are remarkably fine, and its power very great; but in the diameter of some of its pipes, it has recently been surpassed by organs built at York and Birmingham. Immediately under it, and between two masses of pillars, is a group of figures the size of life, in white marble, representing Faith, Hope, and Charity, executed by Xavery, a living artist, and which, according to Chambers, are the best specimens of modern sculpture in Holland. The main chief public buildings and institutions in Haarlem are several churches, public charities and schools, the *Peysierin* Museum, with a good collection of philosophical instruments, and others of fossils, coins, &c., at which lectures on different scientific subjects are delivered; the academy of sciences, the celebrated normal school of M. Preussen, and many other schools; an academy of drawing, an observatory, botanic garden, &c. There are several good private collections of paintings. Haarlem is the residence of a civil governor and a military commandant: is a bishop's see, and the seat of tribunals of original jurisdiction and commerce. It has manufactures of silk, linen, and cotton fabrics, velvets, rugs, carpets, lace, ribands, soap, and oil. Many of these have greatly declined; but, of late, several cotton factories have been established in its neighbourhood under the patronage of the king, and the manufacture of cotton goods has increased materially since the separation of Holland and Belgium. In one of these factories, conducted by a Scotchman, the king is a shareholder; steam-engines are employed to turn the machinery. There are 3 factories on a similar scale at Haarlem, employing in all 2,000 individuals, men, women, and children. The weekly wages of workmen average from 12s. to 13s.; boys and girls get about 1s. 6d. a week. In the environs of Haarlem are extensive bleaching grounds for linens, and here were at one time prepared those fine fabrics, long known in England as Holland cloths. An important branch of trade in Haarlem is the sale of flowers, roots, &c., of which traffic it is the chief seat. Near the city, on the S., are the "Bloemen-Tuin," or gardens for rearing these products. "Each garden is secluded from the public road by a high wall, or a brick house tidily painted; and when admitted, you find

yourself in the midst of offices or warehouses devoted to the great business of drying and packing the roots. Thence the garden stretches out to the length of perhaps a quarter of a mile by a breadth of 100 yds., and is separated from other gardens, as well as frequently divided across by partitions of wood 6 ft. high. In the sunny square spots thus sectioned off, are all the varieties of tulips, dahlias, hyacinths, ranunculuses, and various other flowers. The drying-houses are filled with shelves, in stands, on which are spread myriads of roots, and in adjacent apartments men are kept constantly busy packing for exportation. In packing, each root is first twisted into a small piece of paper, and then a hundred are put together in a paper bag, according to sorts. The bags are afterwards packed in cases, and are thus sent to all parts of the world." (*Chambers*, p. 30.) A large horticulturist and dealer told Mr. Chambers, that he exported annually 300,000 crocus, 200,000 tulip, 100,000 hyacinth, and 100,000 ranunculus roots, besides many of other flowers. At one period, the most extravagant prices were given for these roots; but 100 florins is now considered (and well it may) a very large sum for one, and the greater part of the tulips cultivated and sold by the *Bloemen* in Haarlem, are valued at from 1d. to 20d. each. The city was once celebrated for its printing; but at present this branch of industry is not more active than in an English country town. It has still, however, a type-foundry, chiefly for Greek and Hebrew characters, from which the Jews principally supply themselves with the latter.

The neighbourhood round Haarlem is carefully laid out in plantations and public walks, and for several miles on the road to Leyden the country is sprinkled with numerous neat villas. Immediately to the S. of the city is a wood of considerable extent, in which is a large and elegant mansion in the Grecian style, called the Pavillon. It formerly belonged to Mr. Hope, who sold it for 500,000 guilders (about 42,000*l.*) to Napoleon for his brother Louis. At the peace it was sequestrated by the nation; at present it is shut up; but it is designed to form a gallery for the paintings of Dutch living artists.

The epoch at which Haarlem was founded is uncertain. In 1572 it was besieged by a Spanish force under Toledo, a worthy son of the duke of Alva. The city held out for 7 months, when it being known that the garrison intended to make a desperate *sortie*, as a forlorn hope, terms of capitulation were offered and accepted; but no sooner had the Spaniards obtained possession of the town, than they commenced a massacre of the Inhab., and upwards of 1,000 individuals were either put to the sword, or tied in pairs and thrown into the lake. In 1577 the town was re-taken by the Dutch. Haarlem was the birthplace of Ostade, Wouvermans, Berghem, Van der Helst, and Schreyvius.

The *Hooilammer Meer*, or Lake of Haarlem, is an inlet of the sea, E. of the city, extending 8, to within a short distance of Leyden, and about 33 m. in circumference. It was formed by an inundation at the end of the 16th century, which transformed four small lakes into one sheet of water, and, overflowing the surrounding country, laid several villages waste, and destroyed much property. It has an outlet to the S. communicating with the Old Rhine; on the N. it communicates with the Y by the Spaarn, and by another small outlet which is crossed by the road from Haarlem to Amsterdam. It is generally shallow, except in the middle, and is easily agitated by winds, which drive the waves with great fury against the dykes erected round its shores. It is liable to sudden squalls, and is, on that account, little used for navigation. Various schemes have been proposed for draining this lake, by which at least 50,000 acres of land would be recovered. Hitherto nothing decisive has been done on the subject; but the impression is, that the undertaking will, ere long, be commenced, and that it will succeed. A railway between Haarlem and Amsterdam, which must in part pass through the lake, has been commenced. (See *Chambers' Tour*, p. 31, &c.; *Barrow's Tour in Holland*, &c.; *De Cloet, Pays Bas*; *Dict. Géogr.*, &c.)

HACKNEY, a town and par. of England, co. Middlesex, hund. Ossulstone, 3 m. N. by E. London. Area of par., including the hamlets of Clapton, Homerton, Dalston, Shackwell, and Kingsland, 3,227 acres. Pop., in 1851, 31,647. The town consists chiefly of two wide and well-lighted streets, running nearly in right lines to each other, from which other streets diverge. There are many large and substantial residences both detached and connected with the line of street; but the houses generally are of inferior size. The par., now divided into 3 districts, has 4 churches; the mother-church, St. John's, and 3 chapels of ease. All are commodious; but none are remarkable for architectural elegance. The dissenters have several places of worship, among which is one (now occupied by Unitarians) rendered illustrious by the ministerial labours of Bates, Matthew Henry, Priestley, and Price. At Homerton is an academy for Independent ministers, of which Dr. Pym Smith is the

present principal. There are 3 charity schools, educating in the whole about 500 children; a school of industry for 60 children; and 3 hospitals or almshouses for aged people. At Clapton is the London Orphan Asylum, where 300 children, the orphans of respectable parents, are boarded, clothed, educated, and at Hackneywick is an establishment, supported by the Society for the Suppression of Juvenile Vagrancy. The land about Hackney is chiefly occupied by nurserymen and market-gardeners. Loddige's garden is said to contain some of the finest and rarest exotics in England: the rest of the land is employed in cow-pastures and brick-fields. The parishes of Hackney and Stoke Newington form a union under the Poor-Law Amendment Act; and the expense of maintaining the paupers of Hackney, in 1839, was 7,950*l*.

HADDINGTON (CO. OF). see LOTHIAN.

HADDINGTON, a pari. and royal bor. and market town of Scotland, cap. co. Haddington, 16 miles E. by N. Edinburgh, and 104 W. by S. Dunbar, at the foot of the Garleton hills on the N., and bounded by the Tyne on the E., which stream divides it from the suburb of Nungate, to which, however, it is joined by a bridge of 4 arches. Pop. in 1831, 3,751. The town consists principally of two parallel streets, running E. and W., and a long cross street which bounds one of these, and intersects the other nearly at right angles. The main parallel street, which is a continuation of the road from Edinburgh, is spacious; the general character of the town, as to buildings and appearance, is superior to that of most others of its size. The approaches to it from the E. and W. are ornamented by a number of villas, with gardens and nursery grounds adjoining. The streets are paved, and lighted with gas. The principal buildings are the town-hall, with a lofty spire 150 feet in height; the county buildings, which contain accommodation for the sheriff's court, the meetings of the county, and apartments for the preservation of the public records; and a Gothic parish church, supposed to have been erected in the 13th or 14th century. It is 210 ft. in length; the choir and transept are in a somewhat dilapidated state; it has square towers, and is 90 ft. high. The western part of the cross is used as the parish church. Fordun styles it *lucerna Laudoniae*, the lamp of Lothian. The parish church of Haddington is one of the few churches in Scotland, not in Edinburgh, that are collegiate. There is a new *quoad sacra* church (1839) belonging to the establishment. There are chapels belonging respectively to the Scottish Episcopalians, to the United Associate Synod (two), to the Old Light Burghers, the Independents, and Methodists. Haddington can boast of one of the earliest schools established in Scotland (*M'Crie's Knox*, i. 4.), and it possesses at present an excellent classical seminary under the direction of the magistrates, and 6 other schools. A mechanics' institution was established here in 1823. There are no fewer than five public libraries in the town; and Haddington is the head quarters of the itinerating Libraries, instituted by Mr. Sarsfield Brown. In 1835, there were in East Lothian 43 divisions of these libraries, of 80 volumes each. Each division remains for 2 years in the same place, when it is removed to another locality, and succeeded by a new supply of books of the same number; so that each locality has a fresh supply of new useful reading every two years. Each volume, at an average of the 43 divisions, is read five times during that period. The system of circulating libraries has been extended to various other parts of Scotland, to several districts in England, to Ireland, Canada, South Africa, and Jamaica. The use of the books is gratuitous if so wished, but never more than 1*d*. per annum has been systematically taken from any reader; but voluntary contributions, either in books or money, are received. (*MS. communication from Mr. Brown*.) The number of benevolent, friendly, and religious societies, is great. The number of permanent and occasional poor for three years previously to 1837 inclusive, was annually 179; and the average yearly funds for their support are 84*l*., raised by assessment. The highest rate given is 10*d*., yearly; the lowest 2*d*. 12*d*. (*Report by General Assembly on Poor in Scotland*, 1839, p. 11.) There are no manufactures in the town, but there are two breweries and two distilleries in the vicinity; an iron forge, and coach work; a considerable trade in wool, in tanning and currying leather, in preparing bones and rape-cake for manure, and various minor branches of industry. Haddington is celebrated for its weekly grain market, which is the second in point of importance in Scotland, Dalkeith being the first. In 1839, the quantity of grain of all kinds sold in this market was 43,351 qrs.; but as that year was one of comparative scarcity, the average sale is greatly above what we have stated, being sometimes as high as 80,000 qrs. There are three branch banks, and a savings' bank, the latter instituted in 1815. The agricultural and horticultural societies of the county hold their meetings in the town.

Haddington is very ancient. A castle on its W. bound-

aries was used as a royal residence in the 12th and 13th centuries, and here Alexander II. was born in 1198. A convent of Cistercian, or Bernardine nuns, was founded here in 1176; and a monastery of Franciscan, or Grey Friars, in the subsequent century. (*Kelley's Cat. of Scot. Bishops*, 449, and 462.) The suburb of the Nungate obtains its name from the former of these institutions. It was in this nunnery that the Scottish Parliament was convened (1648), when its assent was given to the marriage of Queen Mary with the Dauphin of France, and to her education at the French court. Haddington has often suffered severely from the overflowing of the Tyne. The last inundation was in 1775, when the river rose 17 ft. above its usual level, and flooded more than half the town. In 1244, the town, then composed of wooden buildings, was totally consumed by fire. It was again nearly consumed from the same cause in 1598; since which latter date, a curfew goes through the town at 8 o'clock, p.m. during winter, when, after tolling a bell, the crier repeats some uncouth rhymes, alluding to the calamity, and warning the inhabitants to greater caution in future. Haddington was the first place visited by cholera in 1831. Of 128 persons seized 57 died. In one night there were 8 deaths. It continued from the 17th Decr. 1831, to 22d Feb. ensuing. Haddington united with Dunbar, Dundee, Dundee, and Edinburgh, in sending a member to the H. of C. In 1839-40, its registered voters were 187. The municipal income is about 1,400*l*. a year.

Various eminent men have been connected with Haddington. John Knox, the famous reformer, is generally believed to have been born in the suburb of Giffordgate in 1505, and received his education at the burgh school; but some writers regard the village of Gifford, five miles distant, as his birthplace. The Maitlands of Lethington, a place within a mile of the town, are well known both in literary and general history. Sir Richard Maitland, Lord Privy Seal of Scotland, and a Lord of Session, was himself a poet, and a collector of ancient Scottish poetry. (*Finkelton's Ancient Scottish Poems*, Lond., 1786; see *Richard's Poems published by the Maitland Club*, 1830.) His eldest son William is well known in history as Secretary of State during the reign of Queen Mary; his second son John was Lord High Chancellor of Scotland; and Thomas, his youngest son, is celebrated both for his Latin poems (*Deliciae Poet. Scot.*), and for being one of the interlocutors in Buchanan's dialogue *De jure regni apud Scotos*. The Duke of Lauderdale, the capricious and tyrannical Secretary of State for Scotland in the time of Charles II., was a descendant of Sir Richard; also John, Earl of Lauderdale, author of "the Works of Virgil translated into English Verse." The only eminent man of more modern times connected with Haddington was the Rev. John Brown, author of the "Self-Interpreting Bible," and other theological works, who died in 1787. (In addition to the works quoted, see *New Stat. Acc. of Scot.*, i. Haddington, i. 17; *Chalmers's Catalogue*.)

HADDINGTON, a burgh and market town and pari. of England, co. Suffolk, hund. Cosford, on the Bret, a tributary of the Stour, 8 m. W. Ipswich, and 58 m. N.E. London. Area of pari., 3,440 acres; pop., in 1831, 3,425. It is an ancient-looking town, exhibiting, both in brick and wood, many curious specimens of old house architecture. The church, a handsome structure with a fine steeple, forms the principal ornament of the town. There are also 12 almshouses, and a curious brick gate-house, with hexagonal turrets, erected at the end of the 15th century. This town had formerly a flourishing clothing trade; but the chief manufacture at present carried on is the spinning of yarn for the Norwich weavers. A silk-mill also employs 297 hands. Hadleigh was formerly a corporate town, but lost its charter by a *quo warranto* in the reign of James II. Markets on Monday; fairs on Whit-Monday, and Oct. 4.

HAGUE (THE). (Dutch *Graevenhaag*, "the count's meadow;" *Fr. La Haye*), a town of Holland, of which it is the cap. and usual residence of the king and court, near S. Holland, on a branch of the canal between Leyden and Rotterdam, 19 m. S.W. the former, and 13 m. N.W. the latter city. lat. 52° 4' 30" N. long. 4° 46' 30" E. Pop. 54,000. It is an open town, being surrounded only by a moat crossed by drawbridges. It has the usual features of a Dutch town; its houses and pavements are of brick, and several of its streets are intersected with canals, and planted with rows of trees; its general appearance, however, is much superior to that of the commercial cities of Holland. The N. end of the town is the fashionable quarter, and in it is the Vyverberg, a fine open space, ornamented with a lake and wooded island in its centre. Around and adjacent to this square are all the chief public edifices. The first of these is the National Museum, occupying the former palace of Prince Maurice, an elegant building of the 17th century. Its extensive picture gallery is reached by a noble staircase; the paintings here are mostly confined to works of the Dutch school, but in that department

the collection is almost unrivalled. The grand object of attraction is Paul Potter's Bull, a picture which occupies nearly the whole end of one of the rooms. "The representation is that of a young bull with brown and white spots, a cow reclining on the green sward before it, two or three sheep, and an aged cowherd leaning over a fence—all as large as life; the background being a distant landscape. The chief animal in the group appears to stand out in bold relief, with a brilliancy in its air that is perfectly startling; such also is the mistiness of the touching, in order to make every hair on the hide and forehead of the creature tell, that the picture will endure the closest inspection. This highly-prized work of art was carried off to Paris by order of Napoleon, and hung in the Louvre." (*Chambers*, p. 22.) The Royal Museum of curiosities, occupying the lower part of the building, consists principally of a large and unique collection of Chinese and Japanese articles. One apartment is devoted to objects of interest connected with Dutch history, containing, among other similar articles, the armour and weapons of De Ruyter. The king's palace, in an adjacent street, presents little that is remarkable either without or within; it is an edifice in the Grecian style, its centre and two wings forming three sides of a square. There is in it a good suite of state rooms, in which the king gives audience, every Wednesday, to his subjects indiscriminately. The palace of the Prince of Orange is a large but plain edifice; it contains, however, a good collection of Dutch paintings, and the valuable assemblage of chalk drawings by the old masters, formerly the property of Sir Thomas Lawrence. On one side of the Vyverberg is the *Binnenhof*, an irregular pile of building of various dates, comprising a handsome Gothic hall, the only existing remnant of the ancient palace of the counts of Holland. It is occupied by various government offices, and the chambers in which the states-general and states of Holland meet. The *Binnenhof* served for the prison of Grotius and Barneveldt; the latter of whom was executed in front of it in 1618. There are 14 churches and several chapels, 2 synagogues, an orphan asylum, state prison, house of correction, 5 poor schools, several intermediate and superior private schools, a royal library with 100,000 vols., a museum of medals, gems, canoes, &c., many private galleries of paintings, and learned and benevolent associations, and a theatre for Dutch, German, and French plays. The favourite promenade is the *Voorhout*, a fine wide road, lined with elegant mansions, planted with rows of trees, furnished with benches, &c., which leads from the N. quarter of the town to the *Bosch*. The latter is a finely wooded park, belonging to the king of Holland, and immediately adjacent to the Hague. In the centre of the grounds, which are embellished with artificial sheets of water, and winding walks amongst the trees, stands the *Huis in den Bosch* (house in the wood), the summer palace of the royal family. It is an edifice of an unpretending character externally, but within are many excellent pictures, and it has a ceiling partly painted by Rubens. About 3 m. W. of the Hague is Scheveningen, a fashionable resort, with Dutch waters, a place; and about 14 m. S. E. the town is the castle of Kyswick, which gave its name to the treaty of 1657.

The Hague has never been a place of much commercial importance. The inhab. derive their resources chiefly from supplying or being employed by the court and government establishments; and they suffered very considerably from the transfer of the seat of government to Amsterdam on the erection of Holland into a kingdom by Napoleon. The manufacture of porcelain, and the printing of books, especially those in the French language, are almost the only branches of industry. There is, however, a cannon foundry, established in 1668.

The Hague became the residence of the feudal lords of Holland in 1250, from which period it continued the seat of government till 1806; it again assumed the rank of a capital on the restoration of the Orange family. It was the native place of the astronomer Huygens, the naturalist Ruysch, and William III. king of England. (*Chambers*; *Barrow*; *De Cloet*; *Encyc. des Gens du Mond.*)

HAGUENAU, a town of France, dép. Bas-Rhin, cap. cant. on the Moder, 15 m. N. Strasburg. Pop. (1836) 8,084. The Moder here divides into 2 arms, one of which intersects the town, while the other encircles it on the S. Haguenau is surrounded by old and ill-constructed walls, and a wide ditch: it was originally fortified by the Emperor Frederick Barbarossa in the 12th century. A fine Gothic church erected about the same period, and ornamented with some elegant sculptures, is its chief public edifice; it has several other churches, a synagogue, civil and military hospital, some good cavalry barracks, a foundry, miller, and other mills, and manufactures of cotton fabrics and yarn, woollens, soap, &c. The forest of Haguenau is one of the largest in France; it extends over an area of 17,000 hectares. (*Hugo*; *Dict. Géog.*, &c.)

HAINAN, or HAIL-LAM, (Chinese, "South of the Sea,") a large island of the Chinese Sea, between lat.

18° and 20° S., and long. 108° 20' and 109° E., belonging to the Chinese empire, and forming a dep. of the prov. of Canton, but separated from the continent by a strait from 15 to 20 m. wide, probably identical with what was called "the Gates of China" by the Mohammedan authors of the 8th and 9th centuries. (*Chinese Repository*, l. 37.) The island is of a somewhat oval shape; greatest length, N. E. to S. W., about 180 m.; average breadth, nearly 70 m. Area perhaps about 12,000 sq. m. Pop. estimated, in 1828, as little short of a million, independent of unconquered tribes in the interior. A mountain chain runs through Hainan in the direction of its length, and near its centre rises above the limit of perpetual snow. In this part of the island the principal rivers take their origin, some of which are of considerable size. The E. coast is bold and rocky; the W. low; the S. has some good harbours; but Hainan generally, like Formosa, is surrounded with many rocks and shoals dangerous to shipping. The climate is very hot; the heat is, however, tempered by sea-breezes, frequent fogs, and abundant dews. The soil is mostly sandy; the W. side of the island is more productive than the E., but the country is, upon the whole, barren; and, except timber, rice, and sugar (the latter principally sent to the N. of China), its articles of export are very few. Its chief wealth consists in its timber: the forests which cover the mountains abound with sandal, cocoa, rose, and other cabinet woods, brazil-wood, ebony, &c. Tobacco, cotton, and indigo are raised, but in no great quantities. Various fruits are grown, and the sweet potato forms an important article of culture and food. Bees are very plentiful, and wax is a valuable item of produce. Pearl oysters and coral abound around the shores, on many parts of which extensive salt-works are established. Small quantities of gold and silver are obtained in the interior. The natives carry on some trade with Anam, Siam, and Singapore. On their voyages to Siam, they cut timber along the coasts of Talampay and Camboja, with which they build junks at Bangkok. These junks are laden with canvas, and a considerable trade is carried on between Hainan, and both cargoes and junks being sold, the profits are divided among the bucciers. Most part of the pop. are Chinese, who are similar to the inhabs. of the opposite coast; but the interior is inhabited by a different race, supposed to be aboriginal, some of whom have submitted to the Chinese government, while others still hold a savage independence. The island is subdivided into 13 districts. The cap. Kiong-tchou, a populous city, and the residence of the Chinese governor, is on the N. coast. Several other towns have a pop. of some thousands of inhabs. Hainan appears to have been discovered by the Chinese about anno 108 B. C., and conquered by them soon afterwards. It was annexed to the prov., of which it now forms a part, in 1381. (*Ritter, Asien Erdkunde*, iii. 881—893; *Purcfoy, in Asiat. Researches*, vol. xx.; *Chinese Repository*, &c.)

HAINAUT, a prov. of Belgium, which see.

HALBERSTADT, a town of the Prussian dom., prov. Saxony, gov. Magdeburg, cap. circ. and principality of same name, on the Havel, a tributary of the Elbe, 32 m. S. W. Magdeburg, next to which it is the largest and most important town in the gov. Pop. (1838) 17,227. (*Bergkhaus*.) It is very ancient; is built chiefly in the Gothic style, and is surrounded with walls, outside which are three suburbs. It has a cathedral, an edifice of the 15th century, remarkable for its paintings and stained glass windows, ten other Protestant, and two Rom. Catholic churches, a synagogue, a handsome mansion house (formerly a royal palace) gymnasium, superior town and girls' schools, a teacher's seminary, two large public libraries, a school of midwifery, an orphan asylum, house of correction, theatre, and several fine private collections of paintings, medals, antiques, &c. It is the seat of the superior courts of the gov., of town and distr. courts, and a board of tolls and taxator, and has numerous factories for woollen stuffs of secondary quality, carpets, linen fabrics, leather gloves, straw hats, starch, tobacco, soap, &c., with extensive oil refineries, numerous breweries, lithographic-printing establishments, and a considerable trade in corn and wood. Its commercial importance appears to have increased of late years. The epoch of its foundation is uncertain. It was made a bishop's see in 804. A great part of it was destroyed in 1179, by Henry the Lion. It was ceded to Prussia, together with its principality, at the peace of Westphalia, and has ever since belonged to that power, except during the existence of the short-lived kingdom of Westphalia, of which it formed a part.

HALES-OWEN, a par. and market-town of England, partly in an insulated portion of co. Salop, bund. Brimstrey, and partly in co. Worcester, lower div. hund. Halfshire, 104 m. N. W. London, 7 m. W. S. W. Birmingham, and 24 m. N. E. Worcester. Area of par., 11,290 acres; pop. of do., in 1831, 11,840. The town, which consists of a handsome main street, crossed by several others of inferior character, stands on the Stour, in a beautiful and well wooded valley, and bears the appearance of a busy and thriving place. The church is of Norman archi-

ture, and has a light spire curiously supported on four arches. St. Kenelm's chapel, situated outside the town, was originally erected in the time of the Saxons, and a part yet remains apparently of that early date. The far larger part, however, was built in the reign of Henry III., and the tower, with its ornamental pinnacles, is an elegant specimen of the Gothic style. Few buildings so small present such striking architectural contrasts. There are three places of worship for dissenters. A free grammar-school was established here during the Commonwealth by a chancery commission, which provided it with an endowment, the present yearly value of which is about 120*l*. The school, open to all boys belonging to the par., is attended by about 50; it affords a classical education, but confers no university advantages, in the way of exhibitions. (*Carlicic.*) Shenstone, the poet, who was also the proprietor of "the Leasowes," a beautiful villa in the neighbourhood, was educated at this school: his monument is in the church. The manufacture of nails and the coarser kinds of hardware and tools constitutes the chief employment of the working classes. Steel is extensively made in the hamlet of Congreaves; and coal mines are worked within the parish.

Halles-owen is under the jurisdiction of the co. magistrates, who hold petty sessions here. A high bailiff, headborough, and constable are annually elected at the court leet of the lord of the manor, and these officers govern the internal economy of the town. A court of requests is held every third week for the recovery of debts under 4*l*, the power of which extends to five other p^{ar}s. This par. forms a part of the Stourbridge union, and the expense of maintaining its poor in 1838 was 21*l* 4*s*. Markets on Monday; fairs on Easter and Whit Monday for horses, cattle, cheese, &c.

An abbey of Premonstratensian monks was founded here in the reign of King John out of funds provided by that monarch. Its revenues at the dissolution of the religious houses, amounted, according to Speed, to 338*l*. The ruins are extensive, and have partly been converted into farming premises. A few very fine lancet windows at the gable end of the chapter-house indicate the style of building to have been early English. (*Antiq. of Salop; Lewis's Top. Dict.*)

HALIFAX, a market town, par., and par. bor. of England, co. York. W. Riding, wap. Morley, on the Hebble, a branch of the Calder, 176 m. N.N.W. London, 84 m. W. S. W. York, and 45 m. W. S. W. Leeds; lat. 53° 44' N., long. 1° 50' W. The entire parish is one of the most extensive in the kingdom, and nearly equals in size the county of Rutland. It includes 23 townships, and 75,740 acres. For rating, it is divided into 3 parts: the parish district of Halifax, the chapelry of Illeptonstall, and the chapelry of Elland; and the following table gives the pop., rate of increase during the last ten years, and the present proportion of pop. to an acre:—

Townships.	Area in acres.	Inhab. houses.	Pop. 1821.	Ratio of in- crease	Pop. 1831.	Pro- p. of pop. to acre.
Halifax par. dist.	990	3,344	12,698	21.8	15,382	15.5

Total of par.	75,740	21,865	98,550	19.4	109,899	1.4

The par. bor. includes the township of Halifax, with small contiguous portions of the townships of N. and S. Owrn, lying along the E. side of the Hebble brook; its pop., in 1821, was 20,142. The town is built on a gentle slope, in a valley surrounded by hills. In many parts the streets are narrow and irregular; but of late several have been widened, and some, as Broad Street and Waterhouse Street, are handsome and spacious. It is well paved, and lighted with gas. The houses are almost exclusively built of stone from the quarries of N. and S. Owrn; but a few still remain, built in the reign of Henry VIII., of plaster, with carved oak framework. Within the entire parish there are no fewer than 18 episcopal,

and 70 dissenting places of worship; but many of these are in the rural districts. Within the town are three churches, the largest and finest of which, St. John's, the parish church, built in the 15th century, is of pointed Gothic architecture. It has a lobby, nave, side aisles, and chancel; and 2 side chapels were added in the 16th century. Of late years a handsome painted window has been put up, similar to the Marygold window in York cathedral. The tower, which is highly ornamented, contains a peal of 50 bells, and is 117 ft. high. In Sowerby Church is a monumental statue of Archbishop Tillotson, a native of that township. Trinity Church, built in 1798, is a Grecian edifice, with Ionic pilasters, surmounted by a tower and cupola at the W. end. St. James's, opened in 1832, is a pseudo-Gothic structure, with square turrets at the W. end. Besides the episcopal places of worship, there are chapels for Independents, Wesleyan Methodists, Methodist New Connection, Rom. Catholics, Primitive Methodists, Unitarians, and the Society of Friends, among which, one, belonging to the Independents is remarkable for classical elegance and good taste. Connected with the churches and chapels are many Sunday schools; and the Halifax S. S. Union comprises no less than 23 schools, attended by upwards of 8,000 children. The National School, built in 1815, near the church, is attended by about 250 boys; and the Lancasterian School, opened in 1818, has rather more than 300 of both sexes. Within the parish are no fewer than 7 free or endowed schools; but of these only one, Smith's charity school, founded in 1726, is situated in the town. Queen Elizabeth's grammar school, in the township of Skircoat, was chartered in 1545, and is under the direction of 12 governors, chosen from among the inhab. The rental of the school property is considerable. The school is free to the sons of all parishioners: but the present number of scholars is only about 40. The grammar schools at Hetherholme, N. Owrn, and Illeptonstall, have a good character, and are attended not only by the free boys, but others, who pay for their schooling. Wheelwright's school at Rishworth is a noble establishment, supported at an expense of more than 2,000*l*. a year, and providing a liberal education for 30 boys, with 2 exhibitions of 160*l*. a year at the universities: it is superintended by 2 masters and a matron. There are numerous charities for the relief of the poor and aged, none of which need any particular mention, except Waterhouse's almshouse and a church school, established in 1627 for 12 aged persons, and 30 orphan children. The largest public building is the Piece Hall, a very extensive quadrangular stone structure, occupying more than 2 acres of ground: it has a rustic basement story, above which are two other stories fronted by colonnades, having walks within them leading to the various storerooms, of which there are 315. In these rooms the manufacturers keep their cloths for sale. This building, erected in 1779, cost 12,000*l*. The infirmary, newly built in very elegant style, furnishes excellent accommodations for the many who resort to it thither. The baths on the Huddersfield road are well adapted for their purpose, and have a bowling-green attached. The building in Harrison-lane, called the Public Rooms, has elegant assembly rooms, and other accommodations, both for pleasure and business. There are 2 subscription libraries, one of which has apartments in the Public Rooms. The town possesses, among other public establishments, a Literary and Philosophical Society, established in 1830, and already offering the advantages of a library and museum. The Odd Fellows' Hall, in St. James's Road, erected in 1839, has a large room adapted for lectures, public meetings, &c. The Mechanics' Institute, founded in 1825, has 400 members, and a library of about 1,400 vols. The theatre, though small, is quite large enough for a pop. that feels little interest in such amusements. Outside the town, on the W., is Gibbithill, where formerly, in consequence of a local law designed principally for the protection of the clothiers, felons convicted of depreeding upon their property were executed, by a machine like the French guillotine. The gas-works are in S. Owrn, and in Owenden are the springs and reservoirs which supply the town with excellent water.

The magistrates of Halifax are also county magistrates. Petty sessions are held every Saturday, and there is a court for the recovery of debts under 15*l*. During the Commonwealth, Halifax sent 2 mems. to the H. of C.; but the franchise was withdrawn at the Restoration; and, notwithstanding its growing and universally acknowledged importance, it had no voice in the legislature till the Reform Act again conferred on it, in 1833, the privilege of sending 3 representatives to the H. of C. The par. bor. includes small portions of N. and S. Owrn, as well as the township of Halifax: registered electors, in 1839-40, 873, of which there belonged to the township of Halifax 805, to S. Owrn 25, and N. Owrn 43. Market on Saturday. Fairs, June 24., and the first Saturday in Nov. for cattle and horses.

For the administration of the poor laws, the par. is formed into two Unions, Halifax union comprising 19

townships, and the Hebben Bridge Union, including the Hemptonstall district and the chapelry of Todmorden.

The rise of Halifax is attributable wholly to its manufacturing industry, which is itself mainly a consequence of its unlimited command of coal and of the means of internal navigation. The cloth-weavers first settled here in the beginning of the 18th century, since which time it slowly, but gradually, increased till the American and French wars, when extraordinary activity prevailed, and the pop. was proportionally enlarged. The introduction of steam-engines and power-looms has also, of late years, contributed in no little degree to increase its importance as a place of trade. The town is united by a canal with the Rochdale canal and the Calder and Hebble navigation; and has, consequently, a navigable communication with Hull on the one hand, and Liverpool on the other. Woollen and worsted cloths are the staple produce of the par., and the following table shows the amount of factory labour bestowed on their manufacture in 1838. (*Parl. Rep.*, 1839.)

Kind of Mills.	Steam power.			Water power.			Hands employed.
	No.	Engines.	Power.	Wheels.	Power.		
Worsted mills	80	50	1,150	23	259	5,514	
Woollen do.	63	29	510	46	407	2,074	
Cotton do.	7	49	1,150	56	478	5,281	
Silk do.	7	8	109	2	14	610	
Total	221	136	2,578	127	1,158	13,579	

The staple manufactures of the town and neighbourhood are shalloons, tammies, and draw-boys, best known under the title of figured lastings and amens, superfine quilled everlastings, double russets and serges, all which are made of combing wool. They are brought in an unfinished state to the Piece-hall, where the merchants attend every Saturday to make their purchases. There is, besides, a very considerable manufactory of kerseys and half-thicks, also of bookings and balze, chiefly carried on in the vale of Ripponden, whence comes a large portion of the cloth used for clothing the British navy. Large quantities are also sent to Holland, and all parts of America. The most promising branch of manufacture, however, is that of cloth and coatings, which was also introduced at the end of the last century by persons of enterprise, who, at vast expense, erected mills on the Calder and its tributaries. The success of these factories was such as to excite the jealousy of the Leeds merchants, who had been previously used to buy the same articles from the lower manufacturers at their cloth-hall, and parliament was petitioned, in 1794 and 1806, to prevent any merchant from becoming a manufacturer. The legislature very properly refused to cramp the energies of Halifax, to serve private interests in Leeds. Bombasins also and crapes, together with other fabrics of silk and worsted mixed, are manufactured here; and the manufacture of cottons is becoming a rapidly increasing and most important branch of industry. A great number of hands are employed in making machinery. (*Watson and Crabtree's Hist. of Halifax*, passim; *Private Information*.)

HALIFAX, a marit. city of British N. America, on a small peninsula on the S.E. coast of Nova Scotia, of which it is the cap. It stands on the declivity of a hill about 250 ft. in height, rising from the W. side of one of the finest harbours in the American continent; lat. 44° 36' N., long. 63° 28' W. Pop., in 1835, exclusive of the army and navy, about 18,000. The streets are generally broad; the principal, which runs next the harbour, is well paved, and most of the others are macadamised. "The appearance of Halifax from the water, or from the opposite shore, is prepossessing and animated. The front of the town is lined with wharfs, alongside which vessels of all sizes, and variously rigged, are incessantly loading or discharging their cargoes. Warehouses rise over the wharfs, as well as in different parts of the town; and dwelling-houses and public buildings rear their heads over each other as they stretch along and up the sides of the hill. The spires of different churches, the building above the town in which the town clock is fixed, a rotunda-built church, the signal posts on Citadel Hill, the different batteries, the variety of style in which the houses are built, some of which are painted white, some blue, and some red; rows of trees showing themselves in different parts of the town, the ships moored opposite the dockyard, the establishments and tall sheers of the latter, the merchant vessels under sail at anchor, or alongside the wharfs; the wooded and rocky scenery of the back-ground, with the islands, and the small town of Dartmouth on the E. shore, are all objects which strike most forcibly on the view of a stranger." (*McGregor's Brit. America*, i. 325.) It is estimated that there are about 1,800 dwelling-houses, and 84 public buildings. Most of the former are built of wood; of the latter, the chief is Province Building, a handsome stone edifice

140 ft. long, by 70 ft. broad, and ornamented with a colonnade of the Ionic order. It comprises chambers for the council and legislative assembly, the supreme court, various government offices, and the Halifax public library. In the S. part of the town is the Government House, a solid, but sombre-looking building, near which is the residence of the military commandant. On the N. side of the town is the admiral's residence, a plain stone building. The dockyard, at the end of a straggling suburb, is the finest out of England; it covers 14 acres, and forms the chief depot of naval stores in the British N. American colonies.* It is peculiarly fitted for the shelter, repair, and outfit of the fleets cruising on the American coast and in the W. Indies; and Mr. McGregor and others have justly censured the plan for the removal of the establishment to Bermuda. The N. and S. barracks may accommodate three regiments; and attached to them there is a good library. The other government buildings are the ordnance and commissariat stores, and the military hospital, erected by the late Duke of Kent. The naval hospital was burnt down some time ago. Dalhousie College is a handsome edifice of freestone, but not yet efficient as a seat of education. There are 2 churches, a large R. Catholic chapel, 2 Presbyterian, and 4 other chapels belonging to different sects, a poor-house, house of correction, an exchange, some assembly-rooms, and a small theatre. The markets are well supplied with provisions, but the inns and boarding-houses are reported to be very indifferent. Several weekly papers, and a monthly magazine are published in Halifax; the inhab. are intelligent and social, and travellers have remarked that the tone of society is there more decidedly English than in most other colonial cities.

The harbour opposite the town, where ships usually anchor, and where, at medium tides, there are 12 fathoms water, is rather more than a mile wide. After narrowing to $\frac{1}{2}$ m., about 1 m. above the upper end of the town, it expands into Bedford Basin, the lower sheet of water, which is completely landlocked, occupies a surface of 10 sq. m., and is capable of containing the whole British navy. Halifax harbour is accessible at all seasons, and its navigation is scarcely ever interrupted by ice. The best mark in sailing for it is Sambre Lighthouse, on a small island off Sambre Head, about 13 m. S. by E. Halifax, with a fixed light 210 ft. high. Another lighthouse stands on Magher's Beach, a spit extending from M'Nab's Island, a wooded and cultivated island at the very entrance of the port. When the latter light is seen, ships may run in without fear. The passage on the W. side of M'Nab's Island is for large ships, the other on the E. has only water for schooners. There are several other small islands further in, on one of which, nearly opposite the town, some strong batteries are mounted. Some other pretty strong forts defend the harbour. North West Arm, which bounds Halifax peninsula on the W., is 4 m. long, nearly $\frac{1}{2}$ m. wide, and has from 10 to 20 fathoms depth of water, with safe anchorage. Near its head lies Magher's Island, some buildings on which, now destroyed, were formerly used for the detention of prisoners of war. A joint stock company's canal, in aid of which the legislature contributed 15,000*l.*, now connects the harbour of Halifax with Cobequid Bay and the Bay of Fundy.

Since its first settlement, in 1749, Halifax has continued to be the seat of a profitable fishery and trade. The latter, especially, is in as prosperous a condition as that of any town in British America; and this city may be said to engross the whole foreign trade of Nova Scotia. The chief trade is with the W. Indies, and other British colonies, the U. States, and Great Britain. In 1836, the number of ships, &c., entering and clearing out of the ports of the colony, was as follows:—

Places.	Inwards.		Outwards.	
	Ships.	Tons.	Ships.	Tons.
Great Britain	108	99,544	112	50,521
British Colonies	2,295	147,781	2,549	170,107
United States	965	97,689	902	90,299
Foreign ships	36	6,119	50	25,755
Total	3,404	331,133	3,574	294,580

The following is an account of the quantities and values of the principal articles exported from the colony of Nova Scotia during 1836:—(See top of next page.) The principal articles of importation are rum and other spirits, manufactured goods, meal and flour, sugar and tea, &c.

In 1817, Halifax was declared a free port to a certain extent, and has since acquired the privilege of warehousing. About 100 square-rigged vessels, and the same number of schooners, with several small craft, were owned in Halifax in 1835. Some ships of large size were

* Mr. Moorsom (*Lettres*, 1850) says that it is only a naval yard, there being no docks. The men-of-war lie alongside a large wharf to refit, or must be hoisted up on slips." (p. 55.) Dartmouth opposite, offers natural facilities for the formation of docks, but these have not been taken advantage of.

EXPORTS.

Goods.	Quantities.	Value.
Beef and pork	6,880 lbs.	17,307
Coal	42,967 tons	28,728
Corn and meal	-	16,949
Fish—(Cod, dry)	221,509 quintals	119,054
Do. wet	37,133 lbs.	80,097
Other sorts of fish	-	1,085
Gypsum	31,489 tons	14,165
Oil, train and sperm	224,967 galls.	29,004
Whitewash	21,000 lbs.	700
Pine timber	15,925 tons	14,717
Deals and planks	-	53,544
Other sorts of wood	-	47,829
Miscellaneous	-	64,888
		446,097

employed in the South Sea fishery; but, generally speaking, the inhab. are less enterprising and successful fishers than the New Englanders. Halifax has some manufactures, but they are of no great importance, and confined to articles of immediate consumption; as soap, candles, leather, paper, snuff, rum, gin, whiskey, port, ale, and refined sugar. There are two private banking companies, and a chamber of commerce, composed of 15 members. Packets sail monthly between Halifax and Falmouth, and others regularly to Liverpool, Boston, New York, and the W. Indies: a steam-boat and ferry-boats also ply constantly to and from Dartmouth, on the opposite side of the harbour. (*McGregor's Brit. America*, l. 323—344.)

Mooroom's Letters; Commerce, *Earl. Papers*, &c.)
HALL (SUGSIAN), a town of Wittenburg, circ. Jaxi, on both sides the Kocher, which is here crossed by a stone bridge, 34 m. N.E. Stuttgart. Pop., with its suburbs, 6,800. It is ancient, and was formerly a free imperial city. It has 7 churches, a fine town-hall, a richly endowed gymnasium, an ancient mint, a hospital, 2 public libraries, &c. Next to Ulm, it is the greatest number of sugar refineries in the kingdom; it has also some soap and other factories, and a large trade in oxen and hogs; but its chief article of commerce is salt, procured from the saline springs in its vicinity, which yield, according to the *Encyc. des Gens*, &c., 80,000, or according to Horchelmann, 95,000 quintals, a year. (*Memninger, Beschreibung von Württemb.*; *Berghaus*, &c.)

HALLE, a town of Prussian Saxony, distr. Merseburg, cap. circ. same name, on the Saale, 93 m. S.S.W. Berlin, 65 m. N.E. Gotha, and 18 m. N.W. Leipzig; lat. 51° 29' 50" N., long. 11° 58' E. Pop. (1839) 24,800. The shape of the town is an irregular parallelogram, and it contains quarters, viz. Halle, Glaucha, and Neumarkt, each of which has its own magistrates. It is old and ill built, and has few remarkable edifices. The Gothic church of St. Mary was built in the 16th century, and that of St. Maurice as early as the 12th. In the market-place is a singular structure, 250 ft. high, called the Red Tower. The other principal buildings are Franke's Institute, the university-hall, and the hospitals. Outside the walls, E. of the town, is an elegant monument in honour of the Germans who fell in the battle of Leipzig. The old castle of Moritzberg, where the archbishops of Magdeburg used formerly to reside, was mostly destroyed in the Thirty Years' War; the solitary remaining wing is used as a Calvinistic church. Halle is not remarkable as a place of trade; but hardware and starch-making are more followed than any other branch of industry. In a valley near the river are two large salt springs, which formerly were extremely productive; at present, however, they yield only about 16,000 quintals a year. Pit-coal is used in these salt-works; but, strange to say, it has not been introduced in any other way.

The university was founded by Frederick I. in 1694, and soon after its establishment became known as the seat of the great *Pietist* divines of Germany, who have exercised in subsequent times a most powerful and beneficial influence over the morals of the people; and since this time it has always been known as a great theological university, though the sentiments of its professors have verged more and more towards *Rationalism*. At the beginning of the present century, the university of Halle had reached the height of its prosperity; but Napoleon's victory at Jena led to its dissolution, nor can it be said to have regained a positive existence till after his overthrow in 1815, when it was united with that of Wittenberg, and called the *United Frederick-University of Halle-Wittenberg*. In 1829 there were 1,400 students, 944 of whom belonged to the theological faculty. Lately, however, the university of Berlin has attracted many of its students, whose numbers have fallen to about 800. *Francke*, *Wolf*, *Vater*, *Semler*, *Wegscheider*, *Gesenius*, *Fisch*, and *Tholuck* are a few among its theologians; besides whom, Meckel, and other medical professors, have contributed to raise its character as a school of medicine. The library contains about 50,000 volumes; and there are, besides, museums of various kinds, an anatomical theatre, chemical laboratory, botanical garden and

HAMADAN.

observatory. Three hospitals connected with the medical school furnish the students with ample opportunities of seeing practice. Besides the university, there are several institutions for education, the chief among which is the institute founded by Francke in 1699. It consists, — 1. of an orphan school, educating about 150 children, 3-4ths of whom are boys; 2. of a royal pedagogium, for educating children of the better classes, and which has trained since its establishment upwards of 3,000 children; 3. of a Latin school, intended chiefly to impart sound grammatical instruction to the sons of the citizens; 4. of a Bible press, which has sent forth some millions of copies of the Scriptures at a cheap rate, and at which also certain classical works are printed for the use of the students. The profits are continually applied to increase the usefulness of the establishment. The building has been recently enriched with an excellent bronze statue of the founder, by Rauch. Its cost was defrayed by a subscription, headed by the king of Prussia. Halle has a society of natural history and an oriental society, and one of the best literary publications of Germany, *Die Allgemeine Literaturzeitung*, has been published here ever since 1804.

HALSTED, a market-town and par. of England, co. Essex, hund. Hincford, on rising ground, near the Colne, 43 m. N.E. London, and 23 m. W. by S. Ipswich. Area of par., 6,280 acres: pop. of ditto, in 1831, 4,637. The town has wide and clean streets, and a good market-place in its centre. The church is a fine old building, in the Gothic style, having a tower and wooden steeple. The living is a vicarage, in the patronage of the bishop of London. Besides the church, there are 3 places of worship for dissenters. A grammar-school was founded here in 1594, for the education of 40 poor children within this or the adjoining parishes, the governors of Christ's Hospital, in London, being the trustees. The revenues, which for some years have amounted to 260l. yearly, have been lately expended in building a good schoolhouse, capable of accommodating 100 scholars; but the master's salary is confined to 20l. a year, and the school is attended by only 25 boys. The trustees have the management of several other town charities. (*Char. Comm. Rep.*) The town has 6 other schools, and the children taught in Sunday schools amount to 700. A linen manufacture has almost wholly decayed; but there is a silk mill employing about 250 people; besides which there are about 180 hand looms employed on figured and plain silk velvets; the wages of the velvet weavers averaging 13s. 3d., and of satin weavers 7s. 6d. weekly. Winding silk employs numerous females: many of the poor people are engaged in straw plaiting: Hops are abundantly raised in the neighbourhood. Halsted, under the Poor Law Amendment Act, is the chief town of a union comprising 16 parishes and the expense of maintaining the poor belonging to this par. was 3,395l. in 1838. Markets on Friday, chiefly for corn: fairs on May 6. and Oct. 29. for cattle, &c.

HAM, a town of France, dép. Somme, cap. cant., in a marshy plain near the Somme, and on the canal d'Angoulême, 35 m. E.S.E. Amiens. Pop. 1,663. It is celebrated for its castle, a strong fortress used as a state prison, in which Prince Polignac, and other ministers of Charles X. were confined for 6 years. This edifice is visible from a great distance; it has a large round tower, built in 1470, 108 feet in height, and as many in diameter, with walls of extraordinary thickness. The lordship of Ham was united to the possessions of the crown by Henri IV.; Louis XIV. demolished the fortifications of the town, but preserved the castle. (*Hugo*, art. *Somme*; *Dict. Géog.*)

HAMADAN (an. *Ecbatana*), a town of Persia, prov. Irak, and cap. beglerbeglik same name, 190 m. W.S.W. Teheran, and 260 m. N.W. Isfahan; lat. 34° 53' N., long. 48° E. It stands on a slope near the small river Hamadan-tché, and at the foot of Mount Elburz (the Alburz of antiquity). Its pop. is variously stated at from 25,000 to 40,000, the smaller number being perhaps nearest the mark. It is meanly built, and occupies a considerable space, the houses being profusely interspersed with trees. The ruins of walls and houses show that it must formerly have been an immense city, filled with splendid edifices; but it now contains only a single good street, the rest being inferior to those seen in other eastern towns. The largest public building is the *Mayid-Jamnah*, in a large square, used as a market-place; there are also several other mosques, an Armenian church, a Jews' synagogue, some public baths, bazaars and caravanserais, all of which indicate, by their ruinous state, the fallen prosperity of the place. Near the great mosque, in a Jews' grave-yard, filled with tombs, stands a building which claims, by its Hebrew inscription, to be the sepulchre of Esther and Mordecai; but Morier is of opinion that the structure is Mohammedan; and it was perhaps raised or rebuilt after the sack of Hamadan by Timur. Within the town also are the tombs of the celebrated physician Avicenna, of the Persian poet Attar, and of the Arabic poet Abul-Hasli; and on this account it is much resorted to by

HAMAH.

pilgrims from all parts of Turkey and Persia. On a height commanding a complete view of the town are the ruins of a castle destroyed by Aga Mahomed Khan; and a little below are some remains, considered by Morier to have belonged to the ancient palace of the Kings of Media. The same writer observes, that "Hamadan presents more objects of research to the antiquary than any other city that he has visited in Persia." The modern town is famed for the manufacture of leather, in which it has a large trade, and carpet and silk weaving is also pursued to some extent; but its chief wealth is derived from its situation on the great commercial road between Bagdad, Tehran, and Isfahan. The environs are highly productive; but the absence of forest timber deprives the scenery of a picturesque character, and causes wood to be so expensive, that dried cow-dung is usually substituted for it as fuel.

There is every reason to believe that Hamadan stands on or near the site of the ancient Ecbatana, Agbatana, or Apobatana; though Sir W. Jones fixed it at Tabriz, and Dr. Williams, of Edinburgh, at Isfahan. No position, however, except Hamadan, will suit the descriptions of Isidore of Carax and Diodorus Siculus, as has been clearly proved by the reviewer of *Williams's Geog. of Asia Minor*, in the *Journal of Education*. (il. p. 305.) Ecbatana of Media was founded, or rather enlarged, by Dejoces, circa anno 880 B.C. The Medes, says Herodotus, "obedient to the command of their king, erected that great and strong city now known under the name of Agbatana, where the walls are built circle within circle, and are so constructed, that each inner circle overtops its outer neighbour by the height of the battlements alone. This was effected partly by the nature of the ground, a conical hill, and partly by the building itself. The number of the circles was seven, and within the innermost were built the palace and the treasury. The circ. of the outermost wall was almost equal to that of Athens. The Median nation were ordered to construct their houses in a circle round the outer wall." (*Herod.* i. 95-130.) We are told in the Apocrypha, that in the reign of Artaxaphad (Phraortes) it was besieged and taken by Nebuchadnezzar, who "spoiled the streets thereof, and turned the beauty thereof into shame." (*Judith*, i. 14.) From the days of Darius to those of Jenghis-khan it was, on account of the coolness of its climate, the favourite residence of the kings of Persia during those months of summer in which the heat of Susa and Isfahan is almost insupportable. It was reduced by the caliph Othman, nearly destroyed by Jenghis Khan, and again taken and ravaged by Timour at the end of the 14th century. It was rebuilt, however, and appears to have been a city of considerable importance under the Sophi dynasty. In 1722 it suffered greatly during the wars that took place after the de-thronement of Shah-Hussein, and more recently from the pillage of the Turks under Ahmed, pacha of Bagdad. It remained subject to the Turks till Nadir Shah drove them beyond the Tigris, and again annexed it to the kingdom of Persia. Its present ruinous appearance is attributable to the fact of its having been so often the theatre of war and the object of plunder. This, the great Median Ecbatana, must not be confounded with the Atropatenean Ecbatana, the site of which has been fixed by Major Rawlinson at Takht-i-Suleiman, 180 m. S.E. of Tabriz. (*Geog. Journal*, x.; *Kinnier's Persia*; *Key Porter's Travels*, ii.; *Morier's Travels*, ii.)

HAMAH (an. Epiphania), a city of Syria, and cap. of a sanjak, on the Orontes, 76 m. N.E. Tripoli, and 81 m. S. Aleppo; lat. 34° 35' N., long. 36° 07' 15" E. Pop., according to Mr. Consul Moore, 44,000. It is pleasantly situated on both banks of the Orontes, or Asazy, which is here crossed by four bridges. The town is walled and otherwise well defended; and some agreeable suburbs give it externally a prepossessing appearance. But the streets, as in most cities of Syria, are narrow, irregular, and dirty; and the houses, though handsome inside, present to the street only unattractive mud-brick walls. The principal buildings are the palace of the Mutesellim and the mosques, one of which is remarkable for a fine old minaret. There are several bazars, three public baths, and some handsome residences with spacious gardens. Some curious hydraulic works for supplying the town with water have been constructed on the river, one of the wheels of which is 70 ft. in diameter. The industry of the town comprises silk and cotton fabrics: it trades largely with Aleppo in European and colonial merchandise, and being on a great caravan route, has considerable commerce with the interior of Asia and Africa. The place suffered much from an earthquake in 1157, in common with other Syrian towns; and hence there are few antiquities, a square mound of earth in the middle of the city being the only vestige of the older buildings. There is no doubt, however, that Hamah stands on the site of the Hamath mentioned in Scripture, and reputed to have been founded by Hamath, son of Canaan. It was known in the time of Moses; and at a later period it was relieved from the oppression of a neighbouring

HAMBURG (REPUBLIC OF). 963

prince by the victorious David, to whom, in testimony of his gratitude, "the king sent Joram, his son, to salute him and to bless him." (2 Sam. viii. 9, 10.) The prophet Amos (vi. 2.) styles it "Hamath the Great." Its name was changed by the Macedonians, in honour of Antiochus Epiphanes; and during the expedition of Pompey into Apamea and Cæle-Syria, it became subject to the Romans, anno 63 a.c. (*Roberts's Hist. and Geog.* ii. 23.; *Buchanan's Trav.* ii.; *Boswell's Reports*.)

HAMBURG (REPUBLIC OF), an indep. state of N.W. Germany, the territories of which comprise the city of Hamburg and the country immediately surrounding it; the town of Bergdorf, with the district called the *Vierländen* (the sovereignty over which is however, shared with Lubeck), Ritzbüttel, Cuxhaven, and the island of Neuwerk, at the mouth of the Elbe, some islands in that river opposite the cap., and several small detached territories, chiefly situated N. of the rest, and enclosed by the Duchy of Holstein. The whole of these dominions are included between lat. 53° 24' and 53° 54' N., and long. 9° 30' and 10° 27' E. Upited area, 150 sq. m. Pop. 153,000, of whom Berghaus says 137,600 are Lutherans, 4,150 Calvinists, 3,180 Rom. Catholics, 570 Mennonites, and 7,500 Jews; but we are assured that these statements are inaccurate, and that the number of Jews is much greater. The more compact central territory round Hamburg is surrounded by the Danish dominions on every side, except on the S. and S.W., where the Elbe separates it from those of Hanover. Besides the Elbe, it is watered by the Alster and Bille. It is generally a level plain: not particularly fertile, excepting the *Vierländen*, to the S.E. The islands in the Elbe called the *marsh-lands* are very productive. A good deal of land is devoted to fruit, flower, and vegetable gardens; and the entire country round Hamburg is dotted over with flourishing villages and plantations. The rural pop. is in a good comfortable condition.

The government "consists of a senate and 3 colleges of citizens. The former is composed of 4 burgo-masters and 24 senators, with the addition of 4 syndics and 4 secretaries: the burgo-masters and 11 of the councillors must be lawyers; the remainder are merchants. The qualification necessary for becoming a senator is, that the individual be born in Hamburg, be above 30 years of age, and a member of the Lutheran Church; no Calvinist or Catholic being permitted to sit at this board.* The senate appoints agents and consuls to foreign courts, and receives foreign ministers; grants letters patent, makes contracts, issues mandates, has the power of mitigation, or of changing the punishment of criminals; and, in fine, the charge of every matter connected with the executive. The *Burgerschaft*, or general body of the citizens, in whose hands the legislative power is placed, are divided into 5 divisions (co-elective with the 5 parishes of the city), who elect the 3 colleges. The first of these is the *College of Officers*, or *armen*, and consists of 15, the privileged inhabit. of each parish having each the choice of 3. The members of this college attend the senate, can debate on any proposition, and should they find the constitution or the laws infringed, can impeach any senator whom they may suspect. The second division of the *Burgerschaft* is called the *College of Sixty*, and consists of the college of aldermen, with 9 other persons, called deacons, from each parish. Their duty is to watch over the inferior depts. of the state. The third division is the *College of One Hundred and Eighty*, and is composed of the 2 former colleges, with 24 sub-deacons out of each of the 5 parishes. This college has very limited duties. In addition to these colleges there is another called the *Kammerri*, composed of 10 members, or 2 from each parish. This chamber is elected for 10 years, and its duty is to audit the public accounts, and lay them before the senate. These several bodies may be said to be merely colleges for controlling the senate (which always assumes the initiative in legislation). But when a law is to be enacted, a law tax to be levied, a new loan to be contracted, or an increase to be made to the salary of any public functionary, the general body of the citizens must be consulted." (*Strang, Germany in 1831*, i. 67, 72.) The citizens of Hamburg are divided into "great" and "small." The former alone are eligible to places of rank and honour, and can buy and sell without restriction. The latter can neither import nor export goods wholesale in their own names, nor transact business on the exchange. "The affair is altogether a matter of money, the expense of becoming a *grosse burger* being 150 marks; that of a *kleine*, 40." (*Strang*, 74.) The right of citizenship is not hereditary; nor can any foreigner transact business in Hamburg without becoming a citizen, nor carry on any kind of manufacture or handicraft without entering one or other of the guilds or corporations, of which 23 exist. Jews are wholly debarred from the last mentioned privileges. There are in the cap. an upper

* The mode of filling up vacancies in this body, is a curious combination of chance and choice; it is fully described in *Strang's Germany*, &c., i. 68-70.

court of justice, which takes cognisance of all suits above 2,000 marks; appeals from which can, however, be made to the superior court of the Hanse Towns at Lubeck: a lower court of justice, which tries criminal cases, and decides in civil causes under 2,000 marks; and a commercial tribunal, a final appeal from the decision of which lies to the superior court of justice. The inferior towns have their own magistracy, and police courts subordinate to 3 directors of police in Hamburg. The armed force consists of a garrison of about 1,400 regularly paid soldiers, and 10,000 unpaid burghers, including all the citizens between the ages of 18 and 45. The contingent furnished to the army of the German Confederation is 1,208 men. The public revenues amount to between 800,000 and 900,000 rix-dollars yearly; the public debt reaches 8,000,000 rix-dollars (about 1,500,000*l.*) Hamburg has as many as 60 consuls in different parts of the world: it enjoys a separate vote in the full German Diet, and together with Lubeck, Bremen, and Frankfurt, has one in the Lesser Council of the Confederation.

HAMBURG, the principal commercial city and seaport of Germany, cap. of the above republic, and one of the three existing Hanse Towns, and four free imperial cities, of Germany; on the N. bank of the Elbe, at the point where it receives the Alster, 60 m. S.E. from its mouth, 60 m. N.E. Bremen, and 36 m. S.W. Lubeck; lat. 53° 32' 51" N., long. 9° 58' 37" E. Pop. 128,000. The city is oval shaped; is about 4 m. in circ., and was formerly fortified; but having suffered severely during its occupation by the French in the last war, its ramparts have been levelled since the peace, and converted into public walks. It is intersected by numerous canals; and its aspect resembles that of a Dutch town. There are some good streets, as the *Grossen Bleichen*, *Neue-Wall*, and *Admiralitäts-Strassen*, the *Jungfernstieg*, &c.; but the rest are mostly narrow, dark, and ill-built. The houses are generally of brick, old-fashioned, and ill-built; and altogether the outward appearance of the city presents but few objects of curiosity to the visitor. The principal ornament of Hamburg is the Alster. This river rises in Holstein, 20 miles above the city, and spreads out into a wide lake, which flows through deep broad ditches some of which encircle the ramparts, and communicate with the Elbe by sluices, while others intersect the city in all directions, forming numerous canals navigable for barges of considerable size. This lake is called the Outer Alster. The Inner Alster is a large square sheet of water connected with the former by a narrow channel, spanned by a single arch. On three sides of the Inner Alster there are broad walks, with rows of trees, the favourite resort of the Hamburgers of all classes and all ages. The beach-houses in the city are to be found in its immediate neighbourhood. The *Jungfernstieg* occupies its S. and W. sides." (*Murray's Handbook for N. Germany*, 16.) "On a summer's evening, when this lake is covered by so large an assemblage of gaily painted boats as to resemble a regatta, and the citizens, in their best attire, are enjoying the cool breezes on its shores, or crowding the numerous coffee-houses that surround it, few cities possess a more agreeable promenade than Hamburg." (*Germany and the Germans*, 15.) There are but few public buildings worthy of notice. The city is divided into five parishes, those of Saints Peter, Nicholas, Catharine, James, and Michael, the churches of which are amongst the principal edifices. The church of St. Peter is the most ancient, having been built in the 12th century; but that of St. Michael is the most interesting. This, which is an edifice of the last century, is 245 ft. long, by 180 ft. broad; and has a tower 450 ft. in height, ascended by a stair of nearly 600 steps. Its interior is capable of accommodating 5,000 persons (*Strang*); it has a fine altar-piece, an organ with 5,600 pipes, and a large crypt supported by 60 granite columns. There are 12 other places of worship, including the chapels of the German, French, and English Calvinists, and the English Episcopal, Calvinist, and R. Catholic churches. The *Börse Halle*, or Exchange Hall, is a handsome building, but it is hidden from the sight: in addition to a large public hall, a small commercial library, and a coffee-house, it has a handsome concert and ball-room, a suite of billiard-rooms, and a printing establishment. A new exchange is now building, and will be opened in 1841. It contains a magnificent hall for the assemblage of the merchants; a hall for the meetings of the merchant company; rooms for the use of the *commercium*, or board of trade, and for the extensive commercial library belonging to the latter institution. Hamburg has a great many charitable institutions, some of which are on a splendid scale. The General Infirmary, erected in 1823 in the suburb of St. George, on the Lubeck road, cost about 85,000*l.* Its yearly expenditure is about 16,500*l.*, the greater part of which is supplied from the city funds. It contains 140 sick wards, the majority about 40 ft. long, 25 ft. broad, and 18 ft. high, and various apartments for different offices, with apartments for officers, &c. It may accommodate from 4,000 to 5,000 patients: invalids of the middle ranks

are attended to in it on their paying a proportionate subscription. In the New Orphan Asylum, 600 orphans are received into the establishment, and 500 more are provided for elsewhere. There are, also, asylums for aged persons, deaf and dumb, the blind, sailors and their widows, &c.; and a private hospital, in which, besides medical attendance, a superior education is also given to deformed children, cripples, &c.; of whom Hamburg contains a large number. The *Bathhaus*, in which the senate and burgher colleges, and the upper court of justice hold their sittings, has within its precincts the treasury, the tax office, a receptacle for the archives of the city, and a guard-house for the burgher-guard. It is an incongruous piece of architecture, having been founded in the 13th century, and added to at different periods in the succeeding ages. The Bank, which stands near it, is a handsome edifice of free stone. The establishment was founded in 1619: it is a bank of deposit only, and is extremely well managed. The Elmbeck-house, workhouse, prison, town-hall, arsenal, and 2 theatres, are amongst the remaining chief buildings; the new theatre is one of the largest in Germany, and the performance and music are generally good. A commodious new building, erected to supply the place of the buildings formerly attached to St. John's church, has been opened this year (1840). It contains the *Gymnasium*, or college for instruction in philosophy, physiology, history, physics, and natural history; the *Johanneum*, or high school, an excellent and well-directed seminary, founded in 1529; and the city library, containing 180,000 vols., open to every burgher and literary man. Hamburg has also an observatory and a botanical garden, academies of design, commerce, navigation, anatomy, &c.; museums of physical objects and works of art, and several learned societies, especially one for the promotion of the fine and useful arts. In 1829, 27 daily a weekly periodical publications were published in Hamburg and circulated over a great part of Germany. But the Hamburg press does not rank high, probably from its being subjected to the paralyzing influence of a censorship.

In 1812, while the town was occupied by the French, a series of wooden bridges, and a *chaussée* connected by ferries with the N. and S. shores, were thrown across the swamps and islands of the Elbe, separating Hamburg from Altona. Having been fitted only for temporary purposes, they were removed in 1816, and the communication is now maintained by steam boats. The arm of the Elbe opposite the city is not very wide, but it is deep enough for vessels of considerable burden. The maintenance of floating lights, buoys, &c., for the safe navigation of the river, is said to cost yearly 60,000 dollars a year. The city harbour presents an animated scene: "a forest of ships of all nations, and from every quarter of the globe; while the face of the stream is covered with boats sporting about in every direction. The tide rises at the quays from 5 to 12 ft., and flows about 20 English miles above the city." (*Strang*, i. 11.) Between Hamburg and Altona, an adjoining town within the Danish territory, is the suburb of St. Paul, a narrow strip of about 4 m., called *Hamburgersberg*, which is in fact a kind of "uppland." The environs of Hamburg abound with the villas of merchants, public cemeteries, pleasantly laid out, amongst which Rainville Garden, near Altona, is pre-eminent.

The manufactures of the town are in some respects not so flourishing as formerly. Thirty-five years ago there might have been 600 sugar refineries; and now there are scarcely 100. Sugar refining is still, however, the chief branch of industry; breweries, distilleries, calico printing, dyeing, lime-kilns, rope-walks, anchor and iron works, rank next in importance. Glue, cork, salicote, leather, wadding, feathers, and tapestry, of all kinds, yarn, woollen, linen, cotton, and silk fabrics, the wax, gold, silver, and copper articles, needles, wax-works, surgical and musical instruments, dyes, &c., &c., amongst the remaining articles of manufacture are shipbuilding, belonging to Hamburg is small as compared with its trade. The English shipowners employ most part of the direct trade with England. The Hamburg ships are almost entirely employed in transatlantic commerce, and in the coasting trade with continental Europe.

Commerce. — Hamburg is the greatest commercial city of Germany, and perhaps of the continent. She owes this distinction principally to her situation. The Elbe, which may be navigated by lighters as far as Melnick in Bohemia, renders her the *entrepôt* of a vast extent of country. Advantage, too, has been taken of natural facilities, that extend still further her internal navigation; a water communication having been established, by means of the Spree, and of artificial cuts and sluices, between the Elbe and the Oder, and between the latter and the Vistula; so that a considerable part of the produce of Silesia destined for foreign markets, and some even of that of Poland, is conveyed to Hamburg. There is, also, a communication by means of a canal with the Trave, and consequently with Lubeck and the Baltic, by which the necessity of resorting to the difficult and

dangerous navigation of the Sound is obviated. Vessels drawing 14 feet water may safely come up to the town at all times, and vessels drawing 18 feet may come safely up with the spring tide. There are no docks nor quays at Hamburg; and it is singular, considering the great trade of the port, that none have been constructed. Vessels moor in the river outside of piles driven into the ground a short distance from shore; and in this situation they are not exposed to any danger unless the piles give way, which, though it rarely happens, occurred on the breaking up of the frost in 1839, when a good deal of injury was done to the shipping. There is a sort of an inner harbour formed by an arm of the Elbe which runs into the city, where small craft lie and discharge their cargoes. The large vessels sometimes load and unload by means of lighters. t Cuxhaven. The trade of Hamburg

embraces every article that Germany either sells to or buys from foreigners. The exports principally consist of linen, grain of all sorts, wool, and woollen cloths, leather, flax, glass, iron, copper, smalts, rags, staves, wooden clocks and toys, Rhinish wines, spelter, &c. Most sorts of Baltic articles, such as grain, flax, iron, pitch and tar, wax, &c., may generally be bought as cheap at Hamburg, allowing for difference of freight, as in the ports whence they were originally brought. The imports consist principally of sugar; coffee, which is the favourite article for speculative purposes; raw cotton; woollen and cotton stuffs and yarn; tobacco, hides, indigo, wine, brandy, rum, dye-woods, tea, pepper, &c. The following table gives a very complete view of the import trade of Hamburg during each of the three years ending with 1838.

ACCOUNT OF THE QUANTITIES AND VALUES OF THE PRINCIPAL FOREIGN GOODS IMPORTED INTO HAMBURG AND ALTONA DURING EACH OF THE THREE YEARS ENDING WITH 1838, WITH THE QUANTITIES IMPORTED IN THE WAY OF TRANSIT.

		1836.			1837.			1838.

Besides the foregoing specified articles may be mentioned the following:—
From the colonies; mahogany, jacaranda, and other

woods, ebony, sarsaparilla, tpecacuanha, taploca, vanilla, tamarinds, gums of various sorts, balsams, drugs, sago, arrow-root, cocoa-nuts, &c.

From France, Spain, Portugal, Italy, and the Levant; feathers, prunes, dates, olives, citron and orange-peel, capers, manna, opium, safflower, saffron, mustard, sponge, cork, sulphur, asphaltum, soda, sulphuric acid, tartar, vinegar, soap, essences, volatile oils, glass wares, carpets, clocks, jewellery, Paris articles, antiques, &c.

From Holland and Belgium; many kinds of seeds, chicory, flower-roots, dyes, drugs, mineral waters, cheese, paper, glass, iron and steel goods.

From Great Britain; sheet tin and copper, brass and iron wire, machinery, sailine, anvils, slate, and numerous kinds of manufactured goods.

From the N. of Europe; fisees, copper, alum, amber, malt, stockfish, caviar, &c.

The customs' duties are as moderate as possible, being one eighth per cent. *ad valorem* on exports, and one half per cent. on imports. Nevertheless, the customs' revenue is found to amount, one year with another, to from 30,000*l.* to 35,000*l.* The rate may, perhaps, be taken on imports and exports, at a rough average, at 5*s.* 3*d.* per cent., which would give, at a medium, 12,380,000*l.* a year for the value of the trade in articles subjected to duties; and adding 2,000,000*l.* for the trade in articles exempted from duties, we have 14,380,000*l.* as the total annual value of the import and export trade of the port. In the year ending Sept. 1839, 3,233 ships arrived at Hamburg, of which 1,490 were from Great Britain. Besides sea-going ships, a great number of vessels arrive at Hamburg by the Elbe; these, in 1838, amounted to 2,085, of the aggregate burden of 99,860 lasts, of which number, 2,274, burden 84,162 lasts, belonged to Prussia. In the same year, 196 ships, of the burden of 28,469 lasts of 4,000 lbs. each, belonged to Hamburg and Altona; and 24 steam vessels filled between Hamburg and other ports, 9 of which went to and from London, and 8 to and from Liverpool.

Transit goods are totally exempted from duty. They are such only as arrive at Hamburg *direct*, and which are neither sold nor exchanged while in the city. The liberty of transit is limited to the term of three months from the time of receiving the transit ticket; but, upon application being made for a prolongation of the term previously to the expiration of the first three months, it is granted on payment of $\frac{1}{4}$ per cent. on the *banco* value of the goods; but under no circumstances is the term extended beyond six months. Goods which are not then exported, they become liable to the ordinary duties. No warehousing system has been introduced at Hamburg; nor, from the smallness of the duties, is it necessary, though it would seem that the time during which goods are allowed to be in *transit* might be advantageously extended. The warehouse rent of a quarter of wheat may be about 1*d.* sterling per month, and of a ton of sugar about 9*d.*; but there are no fixed rates.

Accounts are kept in *marcs* divided into 16 *schellings*, and these into 12 *penninga* each; or else in pounds, *shillings*, and *penninga* *Flemish*. The money of all countries, it is worth 23 to 25 per cent. under the value of bank money (*banco*). There is no coin representing the latter in circulation, all payments made in it being effected by transfers in the books of the bank. The rate of exchange is continually varying; but at an average the *rix dollar banco* is worth 4*s.* 6*d.*; the *rix dollar current*, 3*s.* 8*d.* nearly; the *marc banco*, 1*s.* 5*d.*; and the *marc current*, 1*s.* 2*d.* The Hamburg gold ducat is worth about 9*s.* 4*d.* 100 Hamburg lbs. = 106*s.* 8 lbs. avoird. The *alm* is equivalent to 8*g.*, and is equal to 22*g.* English gallons. The Hamburg foot = 11.2 English inches.

Hamburg is well supplied with provisions, and the traveller is little inconvenienced by those vexatious custom-house regulations so common throughout most part of the Continent. The activity that constantly prevails, and the gaiety and cheerfulness of the inhabitants, render this city an agreeable residence to a visitor. Mr. Hodgskin says, "It resembles Paris on a Sunday; and on week days, when the quays, the streets, and the 'change, are crowded with people of all countries, it resembles London." (*Tour in the N. of Germany*, 1. 198.) Certain customs prevail that arrest the attention of most visitors. Among others, funerals are attended by bodies of hired mourners, some of whom are attired in a black Spanish habit, a large wig, a ruff about their neck, and a sword by their side. These individuals also attend weddings and other festive meetings. The Vierland flower girls, who wear a peculiar costume, market women, and female servants, all carry in the streets an oblong wicker basket covered with a printed cotton shawl of the brightest colours. The public baths, and the dancing saloons, are among the principal features of the city; especially the latter, which are fitted up in most elegant style, and are the most popular places of public resort. Some of them are of questionable reputation; but others are frequented by the families of highly respectable citizens.

The climate of Hamburg is unpleasant, and it suffers frequently from inundations. The drainage of the city is as bad as possible. All the filth from the upper part of the town is conveyed into the beautiful basin of the Alster, and all sorts of filth and rubbish are thrown

into the harbour. But extensive improvements have, in these respects, been recently commenced. The police is good, and beggars are not suffered to infest the streets. The city gates are shut at dusk, but are opened afterwards on payment of a toll, which increases in amount with the lateness of the hour. The water gate is, however, absolutely closed at dark.

This city was founded by Charlemagne towards the close of the 8th century. After the extinction of his dynasty, it became successively subject to the dukes of Saxony and the counts of Holstein. Early in the 18th century it joined with Lubeck in the formation of the Hanseatic league; in 1258 it obtained a portion of territory; and acquired the right to legislate for itself in 1269. In 1528 it adopted Lutheranism. It was long subject to attacks from the Danes, but in 1768 it purchased a resignation of all claims upon it from Denmark, and a security against future attacks. In 1806 it was occupied by the French, and in 1810 made the cap. of the *dép.* Bouches de l'Elbe. It suffered considerably from the exactions of the French troops under Marshal Davoust; but at the peace it was partially indemnified for its losses, and since that time has enjoyed its former flourishing condition. (*Private Information*.)

HAMELN, a fortified town of N. Germany, k. Hanover, distr. Hanover, on the Weser, at its confluence with the Hamel, 23 m. S.W. Hanover. Pop. 6,400. The Weser here forms an island, and on it a large sluice was constructed by Geo. II. in 1734, for the convenience of shipping; the town, by its position, commands the navigation of the Upper Weser, and has extensive communications with different parts of Germany. It is defended by Fort George, a strong fortress on a hill on the opposite side of the river. Its inhab., many of whom are wealthy, and have a considerable trade, carry on various branches of manufacture.

HAMILTON, a parl. bor., market, and manufacturing town of Scotland, co. Lanark, being the cap. of the Middle Ward, on the Clyde, on a rising ground gently sloping towards the E., 10 m. S.E. Glasgow, and 12 m. N.W. Lanark. It is about 1 m. W. of the conflux of the Avon with the Clyde, is intersected by the Cadzow burn, and is about 80 ft. above the level of the high-water mark at Glasgow. Pop. in 1801, 4,711; in 1835, 7,759. Including the par., 9,822. The town is not peculiarly but substantially built, and has an appearance of respectability, wealth, and comfort. It is paved and lighted with gas. The most important of its public buildings are the two parish churches, both elegant structures, particularly the older, in an elevated situation near the centre of the town; and the trades' hall, and jail. This last edifice, which stands on high ground W. of the town, and was built in 1836, has in connection with it suitable apartments for all the public offices, municipal and civil. The court-room, common to the sheriff of the district and magistrates of the burgh, is 37 ft. long by 32 broad. In the vicinity of these buildings are extensive cavalry barracks.

But the great object of attraction connected with this place is Hamilton Palace, the magnificent seat of the Dukes of Hamilton, separated from the town on the E. only by a wall. The pleasure-grounds round the mansion, lying between the town and the Clyde, comprise 1,460 acres, and are the most extensive in Scotland. The oldest portion of the palace was erected about 1531; but the greater part of the building is comparatively modern, some very extensive additions having recently been made to it. The front, which faces the N., is 264 ft. 8 in. in length, adorned by a noble portico, consisting of a double row of Corinthian pillars, each of a single stone 25 ft. high, surmounted by a lofty pediment. The interior decorations are not less splendid than the exterior; and altogether it forms one of the largest and most superb structures of its kind in Britain. The collection of paintings, in particular, has long been considered as unrivalled, at least in Scotland. It contains above 2,000 pictures. There is also a vast number of antique vases, antique cabinets, slabs of porphyry, and other similar relics. Within a mile of the town are Chatterhault, a venerable building, and still an occasional residence of the Dukes of Hamilton, and the ruins of Cadzow Castle, the original seat of this noble family, on the summit of a precipitous rock 200 ft. in height, the base of which is washed by the Avon.

Besides the par. churches, there are 2 meeting-houses belonging to the Relief, 3 to the Associated Synod, and 1 to the Independents. The Cameronian and Rom. Catholics have each public worship here once in 4 or 6 weeks. The old par. church was uncollegiated in 1836; and a new church built for one of the ministers. About 2-3*ds.* of the pop. are dissenters.

The grammar or classical school of Hamilton is of ancient date, and has uniformly been an efficient seminary. There are in the parish 18 other schools, including two for young ladies: the total attendance in 1835 was 997, or about a tenth part of the whole pop.; exclusive of about 538, who attend Sunday schools. There are

several subscription libraries in the town; the largest contains 3,500 volumes. A mechanics' institution has existed here for several years.

The charitable institutions and other provisions made for the poor, are very considerable. There are 3 hospitals, and a good deal of property has been left in mortmain for behoof of the poor. Poor's rates have been introduced; the average annual assessment for 3 years previously to 1837 inclusive, being 802*l.* 17*s.* 2*d.* The average number of permanent poor is 251; of occasional poor, 271. The largest sum paid annually to each pauper is 7*l.* 6*s.* 0*d.*; the lowest, 1*l.* 6*s.* 0*d.* The number of pauper lunatics is 3. (*Report of Gen. Assembly on Poor in Scotland*, 1835, p. 40.)

Hamilton has been the principal seat of imitation cambric weaving since the introduction of the cotton trade into Scotland. The reeds run from 1,200 to 3,000, which are the finest *setts* that cotton has been wrought into. There are 1201 looms in the borough, and 53 in the landward part of the par. The trade has for years been rather on the decline. The average wages of a hand-loom weaver (and there are no other in the town) are never above 1*s.* 6*d.* per day; out of which must be deducted 1*s.* per week for expenses, and 10*s.* per annum for loom-rent. A house with a room and kitchen, and a four-loom shop, lets at from 5*l.* to 6*l.* The females are employed in winding weft, and in tambouring, sometimes in weaving. The work is executed for the Glasgow manufacturers. The last manufacture was introduced here many years ago, but it had become almost extinct, when (about 11 years since) a manufactory of the same kind was introduced, which has continued to prosper. About 20 houses are now engaged in this branch of trade; and it employs upwards of 3,000 females in this and the neighbouring parishes. Vast quantities of black silk veils of peculiar patterns are also manufactured here. A weaver's wife makes higher wages in these trades than her husband. Many thousand check-shirts have of late been manufactured, chiefly for the Australian market. The other branches of trade are of minor importance. There are 3 branch banks.

In the park attached to Cadzow Castle are still preserved genuine specimens of the old Scotch breed of wild cattle: they are milk white, with black muzzles, horns, and hoofs; and are ferocious and untameable. They are not taken and killed like other cattle, but shot in the field. Similar cattle are to be found in Chillingham Park (Lord Tankerville's), and in Chartley Park (Lord Ferrers's).

Cadzow was a royal residence for at least two centuries previously to the battle of Bannockburn in 1314; immediately after which it was conferred on the chief of the Hamilton family, in whose possession it has since continued. In 1474, James, first lord Hamilton, married the Princess Mary, eldest daughter of James II., by which connexion his descendants came to be declared in parliament, on the demise of James V., in the event of the death of his only child Mary, next heirs to the crown. In consequence of the marriage of Anne, duchess of Hamilton, to Lord W. Douglas, eldest son of the Marquis of Douglas, the Hamilton family now represent the male line of the Douglases. On the death of the last Duke of Douglas, in 1761, the house of Hamilton, as male representatives of the Douglases, laid claim to the estates, under the plea that Mr. Douglas, the alleged son and heir of the only sister of the Duke of Douglas, was a supposititious child, taken at Paris, from the real parents. A long lawsuit, well known by the name of the "Douglas cause," was the result. It was decided in Paris, and in the court of session in Scotland, in favour of the Hamiltons; but, on an appeal to the House of Lords, it was ultimately decided in favour of Mr. Douglas, afterwards created Lord Douglas: we believe, however, that the all but unanimous opinion among well informed parties now is, that this decision was flagrantly unjust.

Hamilton was created a royal burgh in 1548; but the magistrates, having consented to resign that privilege, in 1676, accepted of a charter from Anne, Duchess of Hamilton, by which it was constituted the chief burgh of the regality and lordship of Hamilton. An attempt was made by the magistrates, in 1733, to get the original privilege restored, but in vain. Since the passing of the Reform Act it has been a parliamentary burgh, and unites with Aldrie, Linlithgow, Falkirk, and Lanark, in returning 1 mem. to the H. of C. In 1839-40 it had 368 registered voters. Municipal revenue about 2,600*l.*

Among historical events connected with Hamilton, the battle of Bothwell Bridge, fought between the Covenanters and the royal forces, under the Duke of Monmouth, in 1672, deserves mention. The result of the engagement was unfavourable to the former, about 400 of whom were killed on the spot, while 1,300 were taken prisoners. (*Leving's Hist. of Scotland*, iv. 104.)

In addition to various distinguished characters that the noble house of Hamilton has produced (*Burnet's Memoirs of the Dukes of Hamilton*), this burgh has given birth to several eminent persons: Dr. Cullen, the celebrated physician, born here in 1714; Professor Millar, of

Glasgow, author of an *Historical View of the English Government*, and other works; the late Dr. Matthew Baillie, of London, and his sister Miss Joanna Baillie, authoress of *Plays on the Passions*. (See *Boundary Reports*; *New Stat. Account of Scotland*, 1 Lanark, p. 349.; and *Beauties of Scotland*, in addition to the works already quoted.)

HAMME, a town of Belgium, prov. E. Flanders, arrond. Dendermonde, cap. cant., on the Durme, 18 m. E.N.E. Ghent. Pop. with commune (1833), 8,232. It has manufactories of linen, soap, starch, cordage, &c.; with numerous breweries and oil-mills, and a brisk trade with the surrounding country. Some interesting antiquities have been discovered in its neighbourhood.

HAMMERSMITH, a village and chapelry of England, par. Fulham, co. Middlesex, hund. Ossulston, near the N. bank of the Thames, and on the great W. road out of London, from which it is distant 4 m. W. by S. Area, 2,140 acres. Pop., in 1831, 10,222. The village is well paved and lighted with gas; but the streets are irregular and the majority of the houses inferior. Many handsome mansions, however, lie scattered in different parts, and more especially by the side of the river, and along the great road which forms its main street. The church, erected in 1631, is a plain brick building with a low tower; and the interior is old fashioned and inconvenient. The living is a perpetual curacy, in the gift of the Bishop of London. A district church was erected in 1820. The dissenters too have several places of worship, and there is a Jewish synagogue. Close to the R. Cath. chapel is a small Benedictine nunnery, originally a boarding-school, established in 1669; and the monastic rules are strictly observed. Among the charity schools, one founded by Bishop Latimer has revenues amounting to 800*l.* a year. Other day and Sunday schools are supported both by adherents to the church and by dissenters. The most striking feature in Hammersmith is the suspension bridge over the Thames, completed in 1827 at an expense of 40,000*l.* It consists of a horizontal roadway, suspended from iron chains carried over stone piers and archways, and secured by substantial abutments. The roadway is 822 ft. long, and 20 ft. wide, exclusive of a foot-path 5 ft. wide. The West Middlesex Water Company has its engines and reservoirs a little above this bridge. The grounds in the neighbourhood are chiefly occupied by nurserymen and market-gardeners, who supply London with some of the choicest flowers and vegetables. The gardens of the Horticultural Society present a finer display in the summer season than any gardens, private or public, round the metropolis; and the shows are fashionably attended.

HAMPSHIRE, HANTS, or SOUTHAMPTON, a marit. co. on the S. coast of England; it includes the Isle of Wight, and has Berkshire on the N., Surrey and Sussex on the E., Wilts and Dorset on the W., and the English Channel on the S. Area, 1,040,000 acres, of which the Isle of Wight contains about $\frac{1}{5}$ th part; including the island 900,000 acres are supposed to consist of arable, meadow, and pasture land. This is one of the most agreeable co. in England, the surface being finely varied with gently rising hills and fruitful vales, and its climate being at the same time peculiarly mild and genial. Soil various; in the N. districts on the borders of Berks, it is hilly and poor; but between Eastgate and Silchester is some fine wheat and bean land; a broad zone of chalky downs, intersected by numerous valleys, extends across the co. In the S. and middle parts of the co., and particularly in the vales watered by the Anton, Itchen, and other r. crs, are large tracts of fine land, and some of the best water meadows in England. The S.W. district, or that lying between Southampton Water and Dorsetshire, is principally occupied by the New Forest, and by extensive heaths. Principal crops, wheat, barley, oats, and beans; turnips are extensively cultivated, especially on the light soils. Farms till lately have been mostly let on leases, but the practice of holding them at will is gaining ground. Tenants are prohibited from taking two *wheats* crop in succession; but two white crops in succession have not been usually objected to, and it is common to take a crop of oats after wheat. This erroneous practice is, however, beginning to be corrected, and agriculture in this co. is generally good, and the condition of the land such as to reflect credit on the occupiers. Cattle of various breeds; the dairy is not an object of much attention. Stock of sheep large. Weyhill, near Andover, in this co., has the greatest sheep fair in England. At the fair held here in 1840, about 150,000 sheep were exhibited for sale! Hants is famous for its bacon; and excellent honey is produced in different parts of the co. Estates mostly large; farms of all sizes, from 25 to 500 acres. Average rent of land, in 1810, 11*s.* 5*d.* The co. is every where particularly well wooded. The New Forest comprises about 92,000 acres, but only about 67,000 are now the property of the crown, the rest having been assigned to individuals. About 6,000 acres have been inclosed and set apart for the growth of timber. There are the re-

malns of other extensive forests; and brushwoods are met with on most of the chalk lands. Minerals of little importance. If we except the building of ships at Portsmouth, and the various works subordinate to their outfit, the other manufactures are but of trivial importance; there are, however, silk mills at Overton, and straw hats are made in different parts of the co. Principal rivers, Avon, Anton, and Itchen. Portsmouth harbour and the road of Spithead lie in the Sound between the mainland and the Isle of Wight. Principal towns, Portsmouth, Southampton (now united to the metropolis by a railway), Winchester, and Lynton. Hampshire, including the Isle of Wight, has 49 hundreds and 298 parishes. It sends 17 mems. to the H. of C.; viz. 2 for each division of the co.; 2 each for the bors. of Portsmouth, Winchester, Lynton, Southampton, and Andover; 1 for the Isle of Wight; and 1 each for the bors. of Petersfield and Christchurch. Registered electors for the co., in 1838-39, 9,214; viz. 3,533 for the N., and 5,681 for the S. div. In 1831 Hampshire had 55,390 inhab. houses; 652 families; and 314,260 inhabs. of whom 159,082 were males and 162,198 females. Sum paid for the relief of the poor, in 1838-39, 137,928*l*. Annual value of real property in 1815, 1,240,547*l*. Profits of trades and professions in do. 923,714*l*. (See further WIGHT, *IST.* of.)

HAMPSHIRE (NEW), one of the U. S. of America, in the N.E. part of the Union (New England), and between lat. 42° 40' and 45° 10' N., and long. 70° 40' and 72° 23' W.; having N. Lower Canada, E. Maine, W. Vermont, S. Massachusetts, and S.E. the Atlantic, on which, however, it has a coast of only 18 m. Length, N. to S., about 170 m.; breadth very variable. Area, 9,980 m. *Pcp.* in 1837, per estimate, 288,746. The coast is indented by small inlets, but has only one harbour of any value, that of Portsmouth. It is skirted by a narrow sandy plain, which, at no great distance inland, rises rapidly into a hilly country. In the interior, the state is covered with mountains of granitic formation. The White Mountains, towards the N., which attain a height of more than 7,000 ft., are the highest in the Appalachian system, and, consequently, in the U. S. But between the mountains are many green and sheltered valleys, and the state contains a considerable proportion of fertile land, as well as a great deal of beautiful and picturesque scenery. Several of the principal rivers of New England rise in this state; among which are the Connecticut, Merrimac, Piscataqua, Androscoggin, and Saco, which have a general S. direction. The Connecticut forms the W. boundary of the state. There are several considerable lakes, the largest of which, the Winnepissaukee, 23 m. in length, is situated near the centre of the state. With the exception of the alluvial lands bordering the rivers, the soil is, perhaps, more adapted for pasture than cultivation. The country was originally densely wooded, and such is still the character of the interior. Climate very healthy, but cold. The lakes and rivers are generally frozen four months in the year, and winter lasts from Nov. to April. Wheat, rye, maize, barley, oats, pulse, and flax are grown; cattle-breeding is pursued to a considerable extent. Manufactures have greatly augmented of late years: they include cotton and woollen fabrics, nails and other hardware, paper, glass, &c. The exports consist principally of cattle, pork, flax seed, linen, timber, fish, beef, granite, manufactured goods, &c. &c. The foreign trade is but inconsiderable; the value of the exports to foreign countries during the year ending Sept. 30, 1838, having amounted to only 74,670 *doll.* and that of the imports to 169,985 *doll.* The state had, in 1839, 27 banks.

New Hampshire is divided into eight counties; Concord, on Merrimac, being its political cap. Portsmouth is the largest town, and the only sea-port. Dover, Exeter, Hanover, New Ipswich, Keene, and Haverhill are increasing places, already of some size. Dartmouth College, at Hanover, established in 1770, ranks third among the literary institutions of New England. It has attached to it a medical school, library, and philosophical apparatus; and had in 1839 upwards of 300 students. There is a theological seminary at New Hampton, besides upwards of 30 incorporated academies. The state has a literary fund, the income arising from which, with the produce of a tax on banks, is devoted to the support of free schools. These are established on the same system as in the other Atlantic states. A lunatic asylum is about to be established at Portsmouth. In 1839, 20 periodical publications were issued. Several canals have been constructed connected with the Merrimac, which, by its communication with the Middlesex canal, affords a navigable route between many parts of the state and Boston. In 1837, a railroad, 15 m. in length, to extend from Nassau, N.W., to Lowell, Massachusetts, was in progress.

The legislature consists of a senate of 12 mems. and a house of representatives of 234 mems., the mems. of which, as well as the governor, are chosen annually by the electors of each district, consisting of every white male citizen above the age of 21 years who pays taxes and has resided in the state for three months. Together, they are styled the General Court of New Hampshire,

and assemble annually on the 1st Wednesday of June, at Concord. The governor is assisted in his executive duties by a council of 5 mems., elected for a similar period with himself. The poor in this, as in other N. E. states, are supported by a direct tax on the towns to which they belong. The militia, comprising 3 divisions and 6 battalions, consisted, in 1838, of an aggregate body of 28,108 men. Justice is administered in a superior court, and county courts of common pleas, presided over by the judges of the superior court, and two justices selected from each county. The judges hold their offices during good behaviour, until 70 years of age; but may be removed by impeachment, or by address of the two houses of the legislature.

New Hampshire was first colonised by the British in 1622. It was twice united to Massachusetts; and the final separation between them did not take place till 1741. New Hampshire was one of the first states to take a decided part in the war of independence. A temporary constitution was formed in 1784, which, in 1792, was altered and amended nearly to the form now in force. The state sends 5 representatives to Congress. (*Darby's View, &c.*; *Hayward's Gazetteer of New England*; *American Almanac*, 1834, 1840.)

HAMPSTEAD, a par. and village of England, co. Middlesex, hund. Ossulston, 4 m. N.N.W. London. Area of par. (which includes part of Kilburn), 2,070 acres: pop. in 1831, 8,590, being double the pop. in 1801. Value of real prop. (as assessed in 1828), 72,500*l*. The town lies on the brow and S. slope of an irregularly-formed hill, on the summit of which (450 ft. above high-water mark) is an extensive heath covering about 290 acres, which commands fine views of the metropolis, Kent, and Surrey southward, and of the highly cultivated lands of Bucks and Herts on the N.W. The streets are mostly crooked and irregular, lined with houses of every size and quality, from the spacious mansion to the mere cottage; and the subordinate streets, connecting High Street with the other parts, are narrow, inconvenient, and in some places even dangerous. The church, which has been parochial since 1598 (when Hampstead was separated from Hendon), was rebuilt by subscription in 1747; it is a plain brick building, having at its E. end a lower square steeple. The living is a vicarage, and there is a lectureship founded some years ago, for the benefit of the curates. A chapel of ease, in Well Walk, occupies what was a century back the most fashionable assembly-room in the town, and a favourite place of resort for all who came to drink the chalybeate waters: another chapel, recently erected, has a handsome cupola and portico. There are places of worship for Independents, Wesleyan Methodists, Unitarians, and Rom. Catholics; but they are of small extent. Besides churches and chapels, the large assembly-room attached to the Holly-cutt inn is the only public building; but numerous large private mansions, in different parts within and round the town, attest its importance as a fashionable suburban retreat. A large square house, on an eminence to the left of the London road, with a row of elms in front, once belonged to Sir Harry Vane, one of the regicides, who, at the Restoration, was here seized, and soon after executed: it was subsequently occupied by Bishop Butler. In the upper part of the town, near the Terrace, is Branch-hill Lodge, once the residence of the Earl of Macclesfield and Lord Loughborough; but its fine collection of painted glass windows, procured from various convents at the period of the French revolution, has been removed, by Sir Thomas Neave, to his house at Dagenham, in Essex. The Upper Flask Inn, in High Street, formerly the resort of the celebrated Kit-cat Club, and subsequently inhabited by G. Steevens, the editor of Shakespeare, is now a private residence. The inns receive hundreds of visitors on the Sundays during summer.

The manor of *Hampstead* was given by King Ethelred to the Abbey church of Westminster, by whom it was held till 1550, when Edward VI. took possession of it and presented it to a layman, from whom the present lord of the manor is descended. In the reign of Henry VIII. Hampstead was an obscure hamlet, "chiefly inhabited by washerwomen;" and being well covered with wood, and abounding with game, it was often visited by hunting parties from court. James II. is said to have had a hunting-seat here, still known as Chicken House, and now let out to several poor people. About 1640, Hampstead became a fashionable watering-place, and concerts, balls, and races were established for the amusement of the visitors. The wells (the water of which is a simple carbonate chalybeate) were in high repute during the 17th century, but they have long since ceased to attract attention. The election of mems. for the co. was held on the heath from 1690 to 1701 when it was removed to Brentford.

HAMPTON, a village and par. of England, co. Middlesex, hund. Spelthorne, on the N. bank of the Thames, opposite the point where it receives the Mole, 12 m. W.S.W. London, and 3 m. W. of N. Kingston. Area of par., 3,190 acres. Pop. in 1831, 4,626, including the

hamlet of Hamptonwick, close to Kingston, 3,992. The town, which is a favourite resort for anglers, is not remarkable either for the width of streets or regularity of the buildings; but many beautiful villas ornament the neighbourhood, among which is one formerly the property of the celebrated David Garrick. A wooden bridge, built across the Thames in 1753, joins the town to E. Moulsey. The church, lately rebuilt, is a very handsome structure, having a square tower at the W. end. A free grammar school was founded here in 1566, and the original endowment has been subsequently so much enlarged, as to furnish a master with a salary of 200*l.*, and a sum of 36*l.* yearly for six poor men. The average attendance of boys is 60: the present instruction is confined to English, writing, and accounts.

About 1 m. from the village, and close to the Thames, is Hampton Court Palace, respecting which Grotius has not scrupled to say,—

*Si quis opes necesse (sed quis tamen ille ?) Britannus,
HAMPTON-CURIA tuos consultat ille lares;
Consistent totum sparsa Palatia muros;
Dicit illi Reges, hic habitare Deos !*

The palace was begun by Cardinal Wolsey, who, in 1526, presented it to Henry VIII. The original edifice consisted of five quadrangles, of which two only remain. The W. quadrangle, little altered since Wolsey's time, presents a good specimen of Tudor architecture; the middle or clock court is of mixed style, Sir C. Wren's Ionic colonnade strangely contrasting with the massive construction of the old building: the third quadrangle was erected by William III. The king's entrance in the clock-court leads to the grand staircase and state apartments. The ceiling and walls of the former were painted by Verrio, in his usual glaring style: the rooms, which open from each other, and are partially furnished, consist of the guard-chamber, presence and audience chambers, public dining-room, state drawing-room and bed-rooms. Notwithstanding the removal of some of the best specimens to Windsor, there is still at Hampton Court an extensive and excellent collection of pictures. It comprises many by the principal Italian and Flemish masters; and an extensive collection of portraits connected with English history by Holbein, Lely, Kneller, West, &c. But the great glory of Hampton Court is the *Cartoons* or drawings executed by Raphael, by order of Pope Leo X., for patterns for tapestry intended to decorate the Vatican. They are called cartoons from being painted on sheets of large paper, *cartone*. These noble drawings, of which there were originally 25, being left neglected at Brussels, the greater number of them appear to have been lost or destroyed. Fortunately, however, *seven* were purchased by Rubens for Charles I.; but even since their arrival in this country they have been exposed to numerous vicissitudes, and would seem to owe their preservation as much to accident as to any thing else. The gallery in which they are now placed at Hampton Court, was built for their reception by William III.; but George III. removed them first to Buckingham Palace, and thence to Windsor, whence they have been again brought back to Hampton Court. They represent some of the most striking incidents recorded in the New Testament, and are unrivalled for sublimity of conception and purity of design. They have been well engraved by Holloway.

Among the parts of the palace not usually shown to the public are the chapel and hall, the former of which was refitted after the ravages of the fanatics during the Commonwealth, and handsomely pewed with oak by Q. Anne. The latter, built by Wolsey, and still retaining his name, is a finely proportioned room 160 ft. long, and 40 ft. broad, having two large gabled windows, and an elaborately carved wooden roof, similar to that of Westminster Hall and that of Christ Church Hall, Oxford. This room was thoroughly restored on the old model in 1801. Close to the Hall is the Board of Green Cloth, a small, though very beautiful Gothic chamber, which furnished Sir Walter Scott with the pattern for one of the finest rooms at Abbotsford. "The garden front of the palace, though disfigured by modern windows, is still very magnificent. The garden comprise about 44 acres: the pleasure-grounds were laid out by William III. in the Dutch taste: the terrace is $\frac{1}{2}$ m. long, and the first view of it is very striking. The home-park, immediately adjoining the gardens, is 5 m. in circuit, and its soil produces very fine herbage. The canal, which is $\frac{1}{2}$ m. long, and 40 yds. broad, is lined with an avenue of lime trees, and other avenues intersect the park in every direction, through one of which is a good view of the tower of Kingston church." (*Jesse's Gleanings*, 3d ser.) The green-houses contain, among many valuable exotics, a vine said to be the largest and most productive in Europe; and a maze or labyrinth furnished much amusement to young visitors. This palace, in which Wolsey maintained a more than regal state, was afterwards the favourite residence of Henry VIII. and his children, and of James I. and his son Charles I., who escaped from his imprisonment here in 1647. The protector, Cromwell, resided here during

the commonwealth; and it afterwards became the usual abode of William III. and his queen, and of the princess, afterwards Queen Anne. George II. was the last monarch by whom it was inhabited. Of late years it has been mostly divided into private dwellings, given to court-pensioners. Latterly it has been fully opened to the public. All individuals are now freely admitted to view the public apartments and grounds, without any demand being made upon them; and without, as formerly, being hurried from one apartment to another, at the caprice of some mercenary cicerone. In consequence, Hampton Court is resorted to in summer by crowds of visitors, and is decidedly one of the principal points of attraction in the vicinity of the metropolis. Near Hampton Court palace is Bushy Park, comprising 1,100 acres, with a central avenue 1 m. long. "The numerous thorn-trees, though of great age, are still healthy and vigorous; and when they are in blossom, they appear at a short distance as if covered with snow." (*Jesse*.) The house on the right of the grand avenue was during many years the favourite retreat of William IV. when Duke of Clarence, and is still inhabited by Queen Adelaide, the present regent of Greece. (*J. Goss's Environs; Jesse's Gleanings*.)

HANAU, a town of W. Germany, electorate of Hesse, cap. prov. of same name, and seat of its superior courts, &c.; on the Kinzig, near its junction with the Main, 11 m. E. by N. Frankfurt, and 82 m. S.E. W. Cassel; lat. 50° 8' 24" N., long. 8° 55' 17" E. Pop., inclusive of its suburbs, 15,000. Hanau is no longer fortified; and its ancient castle is now used for the purposes of the Wetteravian Society of Natural History. It is divided into the old and new towns; the former is ill-built, but the latter has broad and regular streets, modern built houses, and, near its centre, a good market-place. There are 4 Calvinistic parish churches, 1 Rom. Cath. church, a large hospital, handsome theatre, gymnasium, free school, drawing academy, many scientific and benevolent associations, a school of trades, &c. Hanau is the most industrious town, and the place of the greatest commercial activity in the electorate. Its manufactures are numerous and extensive, including silk stuffs, camlets, leather, gloves, stockings, hats, excellent carpets, cotton fabrics, tobacco, playing-cards, gold and silver wares, brass musical instruments, carriages, &c. It has a large trade in timber, barrels, and wine. Many of its inhabitants are descendants of Dutch and Flemish emigrants, who fled thither from the persecutions in the low countries, under Philip II., early in the 16th century. Very near it are the mineral springs of Wilhelmstadt. Here, on the 30th of October, 1813, Napoleon, on his retreat from Leipzig, gained a decisive victory over a very superior force of Bavarians, and other galled troops, under Marshal Wrede. The combined army lost about 10,000; while the loss of the French did not exceed 3,000 or 4,000 men; but the opening of the route to France was the most important advantage gained by the latter. The principality of which Hanau was formerly the cap., was, after the extinction of its line of princes in 1736, annexed to the Hesse-Cassel and Hesse-Darmstadt. (*Encyc. des Gens du Monde; Cammabich; Berghaus*, &c.)

HANG-TCHEOU, one of the largest and richest cities of China, cap. prov. Tche-kiang; on the Tsalen-tang-kiang, 20 m. from its mouth in the Eastern Sea, and 140 m. S.E. Nanking; lat. 30° 20' 20" N., long. 119° 48' E. Its pop. was estimated by Du Halde at upwards of a million, without, apparently, including the pop. of the suburbs; but this estimate is most probably much beyond the mark, especially as the houses are but one story high, and there are gardens of large size interspersed among them. The city is surrounded with high and thick walls, said to be as much as four leagues in circuit. The W. part of this enclosure is taken up by a fort or citadel, in which the officers of the government reside, and a garrison of 30,000 men is maintained. The Grand Canal has its S. terminus here, in a large commodious basin. This city has, in consequence, a direct communication with Peking, and a vast command of internal navigation, which it has turned to good account. On its W. side is a lake highly celebrated for its natural and artificial beauties. Below, by whom this city was visited, says, "the city of Hang-tcheou-foo, being particularly famed for its silk trade, we were not surprised to meet with extensive shops and warehouses: in point of size, and the stock contained within them, they might be said to vie with the best in London. In some of these were not fewer than ten or twelve persons serving behind the counter; but in passing through the whole city not a single woman was visible, either within-doors or without. The crowd of people, composed of the other sex, appeared to be little inferior to that in the great streets of Peking." (*Travels*, p. 237.) The streets are not so wide as Cranbourn Alley, but as well paved. They are ornamented in many places with triumphal arches, and monuments to eminent individuals, and are kept remarkably neat and clean. Barrow says: "In every shop were exposed to view silks of different manufactures, dyed cottons and nankins, a great variety of English broad-cloths, chiefly however blue and near-

let, used for winter clothes, for chair covers, and for carpets, and also a quantity of peltry, intended for the northern markets. The rest of the houses, in the public streets through which we passed, consisted of butchers' and bakers' shops, fishmongers, dealers in rice and other grain, ivory cutters, dealers in lacquered ware, tea-houses, cook-shops, and coffin-makers; the last of which is a trade of no small note in China. The number of inhab. in the suburbs, with those that constantly resided upon the water, were, perhaps, nearly equal to those within the walls." (*Barrow; Du Halde, vol. i.; Dict. Géographique.*)

HANLEY, a town and chapelry of England, belonging to the par. of Stoke-upon-Trent, co. Stafford, hund. Pirehill-north, 2½ m. S. E. Stoke-upon-Trent, and 16 m. N. Stafford. Pop., in 1831, 7,121. It consists of one main street, intersected by various others; and many good houses have recently been built, though the pop. is chiefly confined to the working classes. The church is handsome, and has a fine tower 100 ft. high. Good schools are connected both with the church and the three dissenting places of worship. The inhab. are chiefly employed in the potteries, which alone have raised this district to its present importance. For further particulars, see **STOKE-UPON-TRENT**, and **POTTERIES**.

HANOVER, a kindg. of N.W. Germany, situated between lat. 51° 18' and 53° 52' N., and long. 6° 43' and 11° 45' E., bounded N. by the German Ocean and the Elbe, E. by Prussia and Brunswick, S. by Prussia and Hesse-Cassel, and W. by Holland. Its bounding line is very irregular, and a portion on the W. is almost divided from the rest of the kingdom by the grand duchy of Oldenburg. Length, from mouth of Elbe S., 172 m.; breadth, E. and W., 180 m. It has 7 districts (*Landrosteien*): the area, population, &c. are as follows (*Reden's Hannover*, 1, 1, 2.):—

Landrosteien.	Area in Miles.	Pop. in 1831.	Pop. in 1831.	Houses.	Villages.	Towns.
Hanover -	5	2,463	325,390	131,7	44,795	880

The most populous towns of the kingdom are Hanover (the capital), 24,000 inhab.; Hildesheim, 15,000; Göttingen, 10,900; Lüneburg, 11,900; Celle, 10,300; Stade, 5,700; Osnaburg, 11,600; Emden, 12,000; Aurich, 12,000; and Clausthal, 9,100. The population of 1823 was 1,434,130; so that in 12 years there has been an increase of 254,150, or about 21,000 yearly, the ratio of increase being 17.7 per cent. The number of marriages has not, however, increased in a proportional degree; and the present ratio of illegitimate to legitimate children is, for all Hanover, 1 in 10, and in the various districts, as follows:—Hanover, 1 in 8; Hildesheim, 1 in 8; Clausthal, 1 in 8; Lüneburg, 1 in 9; Stade, 1 in 16; Aurich, 1 in 21; Osnaburg, 1 in 20.

Surface.—Hanover, physically considered, is an inclined plain, gently sloping from S.E. to N.W., and no where, except on a few of its eminences, more elevated than 200 ft. above the sea. The districts of Stade, Lüneburg, Hanover, and part of Osnaburg belong to the N. plain of Germany, which stretches from the North Sea E. into Russia. No hill in the central provinces reaches 1,400 ft. In the S. part of Hildesheim are the Harz Mountains, the highest summit of which, Königberg, is 3,500 ft. The well-known Brocken (3,850 ft.) is within the Prussian dominion. This mountain mass forms the watershed between the Elbe and Weser. Its geological formation is chiefly granite overlaid by grauwacké, grauwacké slate, and clay slate; and in these latter formations the mineral riches, hereafter described, are mostly found. Above these strata lie the *Stöck* and tertiary formations. The great plain of the N., with the exception of a few limestone hills in Lüneburg and Stade, is of diluvial formation, and consists either of extensive tracts of sand covered with furze, or of vast moors and marsh-lands. The heath of Lüneburg, in its whole extent, comprises about 1-6th of the kingdom; granite boulders are found in different parts of it, some of very extraordinary size. Of the peat-moors the largest are the Bourtranger moor, on the Ems, and the Hoch moor, in E. Friesland. The lowlands on the sea-coast are below the sea-level, and hence are kept dry by means of dykes similar to those of Holland and the Bedford Level, the maintenance of which occasions an expenditure of several thousand dollars yearly. These lands, however, are by far the most productive of the kingdom.

Rivers and Lakes.—Hanover is traversed by three large rivers, all of which fall into the German Ocean:—1. the Elbe, which, rising in the plateau of Bohemia, enters the kingdom at Schnakenburg, and forms, with a slight exception, its whole N. boundary, as far as its mouth; its chief affluents within Hanover are the Jette, Ilmenau, Este, and Oker, all on the S. bank: 2. the Weser, formed by the junction of the Werra and Fulda at Münden, flowing N.W. as far as the juncture of the Aller, and its tributary the Leine, and thence N. past Bremen into the German Ocean: 3. the Ems, rising in Westphalia, and flowing N. through the moorlands of Mappen, and E. Friesland to Emden, at its mouth. Throughout the flats of N. Germany there are numerous lakes and stagnant pools, in which the water subsides after the floods, which extensively cover the country in winter and spring: the chief of these in Hanover are the Steinhuder-meer, 5 m. long by 2½ broad, the Dümmer-see, and the Seeburger-see. In E. Friesland the subterraneous lake Jordan is so thickly coated with vegetation, that wagons can pass over it. The mountain lake Odetelch, in the Harz, is 2,300 ft. above the sea.

Soil and Climate.—The nature of the soil of Hanover will be best understood from the distribution of the land, as stated by Marcard. (The morgen is equal to 64 Eng. acre.)

Arable meadow, and garden land	5,835,000 morg.
Forests	2,242,000 "
Waste land, lakes, and rivers	6,614,000 "

Total of the kingdom. - 14,589,000 -

The waste lands, which form so large a proportion of the whole country, consist principally of vast sandy tracts wholly unavailable for tillage. They extend in a broad belt across the kingdom, of which they occupy about 1-6th part. This band of sand is aptly termed "the Arabia of Germany." The sandy districts are covered with heath, on which a very small and hardy breed of sheep, known by the name of *Saidschnucken*, find a scanty subsistence. They yield wool of the coarsest description, but their flesh is well-flavoured.

The proportion of land under cultivation to the whole extent of each province is as follows:—

Hanover	-	-	39	Stade	-	-	40
Hildesheim	-	-	58	Osnaburg	-	-	51
Lüneburg	-	-	37	Aurich	-	-	76

The richest land of the kingdom is the alluvial soil and *wald-clay* of the Hadeln-land at the mouth of the Elbe, and of E. Friesland at the mouth of the Weser. It is taxed, as belonging to the highest class. The soils of the secondary classes are found in the limestone districts of Hildesheim, Göttingen and Grubenhagen, Bremen and Verden. The least productive of all, belonging to the lowest class, is that of the duchy of Arternberg-Meppen. Much of this land, however, is laid out in meadow, especially the rich soil of E. Friesland, as the following table, giving the proportion of meadow to the whole cultivable soil, will show:—

E. Friesland	-	-	56	per ct.	Lüneburg, Dannenberg,	-	-	25	per ct.
Bremen and Verden	-	-	36	-	and Lauenburg	-	-	21	-
Osnaburg	-	-	31	-	Grubenhagen	-	-	18	-
Stade	-	-	27	-	Kalenberg	-	-	16	-
Diepholz	-	-	27	-	Göttingen	-	-	16	-
					Hildesheim	-	-	11	-

In E. Friesland 4½ cwt. of hay are reckoned as the produce of a morgen of meadow land, and 2½ morgen of summer pasture are reckoned in that province to one cow. In Hildesheim, the morgen yields half a cwt. of hay, and 6½ morgen are deemed enough to pasture one cow.

The climate is damp and unwholesome in the low country about the coast; but the winters are not so severe as in the interior, where, especially near the Harz, they begin in September, and last till May. The spring is the most gloomy and disagreeable part of the year, owing to the long prevalence of N.E. and E. winds. S.W. winds prevail in the summer months. The temperature of the kingdom is thus stated by Von Reden, in his *Statistical Description of Hanover*, 1. 24.:—

Place.	Mean Temperature (Réaumur.).				
	Year.	Spring.	Summer.	Autumn.	Winter.
Cuxhaven	6.90	8.90	13.40	7.70	0.40
Lüneburg	7.2	7.04	13.8	7.4	0.7
Göttingen	6.8	5.4	14.6	7.4	0.7
Harz district	4.9				
Average of kingdom	7.4	6.8	14.5	7.7	0.8

The fall of rain during the year averages 28.5 in.; but it is very unequal in different parts of the kingdom. Fogs prevail in the dyke-lands; and in the winter violent storms frequently occur, causing great damage to the embankments and drainage.

Agriculture and Grazing.—The soil, on account of its

general mediocre quality, requires effective cultivation to make it profitable to the proprietor: this, however, is seldom to be met with, owing to the smallness of the estates into which the land is divided.

Table showing the proprietorship of the soil of Hanover.

Proprietors.	Arable and Meadow.	Drained Land.	Forests.	Common-land.	Prop. to Total.
Royal domains	208,893	1,837	1,200,516	10,081*	17-6
Monasteries	42,295	191	20,695	2,998	9
Nobles	321,360	246	171,250	7,583	6-1
State offices and corporations	73,680	578	725,754	612,674	9-9
Clergy and schools	141,461	14	20,436	4,495	1-9
Other small proprietors (265,630) -	5,014,917	180	94,955	5,092	63-6
Total of land (except turf-moors)	5,832,006	2,864	2,242,576	641,823	100

* These numbers refer to the number of cattle which this land is capable of grazing.

Thus it appears that 3-5ths of the land is in the hands of small proprietors, the average property of each of whom is only 30 morgen, or 12 acres; while only 1-5th belongs to those who can furnish an adequate capital for scientific cultivation.

The best cultivated lands belong to the crown and the nobility, and on these estates as much attention is given to improved systems of tillage as in Pomerania and Prussia. In the land held by small proprietors, the best farms are in the marsh-lands, and they both yield abundant crops and support numerous cattle. The freeholds in the principalities of Hildesheim, Göttingen, Grubenhagen, part of Kalenberg, and near the large towns, are next in order as respects tillage. Among these the system prevails, called *Koppel-schlag-wirtschaft*, which consists in parceling the land out into a number of fields for a rotation of crops proportioned to the numbers of the owner's cattle, and his consequent power of keeping the land properly dressed. The small proprietors in the sandy districts, and the *Meier* (stewards), who farm small parts of the crown lands, and of the nobles' estates, abide by the old fashion of three courses, — fallow, winter corn (chiefly rye), and summer corn (barley or oats), with clover on the fallow, where the land will bear it. Potatoes are universally grown, and constitute the chief food of the poor. Rye is generally grown for bread, the raising of wheat being confined to the rich weald soils, and the quantity is insufficient for the demand. Barley and oats are largely cultivated, and when in demand, are exported to England in considerable quantities. Clover and lucern are much grown on good farms, and even by the peasants, on dry soils. Turnips are becoming a favourite article of production, and flax, hemp, tobacco, and hops are more or less cultivated in different parts. The cranberries, abounding on the heath-lands, are gathered for exportation. The forest-land, which amounts to 2,242,576 morgen (equal to about 1,400,000 acres), yields about 51,878,000 cubic ft. of timber yearly, not including inferior wood.* The timber in the Harz district consists of fir: large beech and oak forests are found in Kalenberg, the duchy of Bremen, and the Upper Weser. These forests are under special control, and even when forming a part of private property, are conceded to foresters scientifically educated and licensed for the purpose. With all this plenty and care, however, the Hanoverian timber merchants are often undersold at Bremen by the Thuringian dealers, who float their deals down the Werra.

Cattle-breeding, which is extensively carried on in every province, is on the increase; but grazing husbandry is as little understood and attended to as agriculture. The horses of E. Friesland are those most prized, as the rich pasturage is favourable to the growth of the foals; but horse-breeding is well managed every where in the level country, and a great number of horses are annually exported. The government has a stud at Celle, which sends out stallions to 70 stations, and has proved a most useful institution. In 1817, the number of horses in the kingdom was 224,627; it is now 250,000. The number of horned cattle, in 1817, was 640,633; it is now 900,000. E. Friesland and the district of Hoya have the best breeds, the large Dutch cow being preferred in those parts. In the rest of the kingdom, the breed is small and wretched, excepting always the stocks of rich proprietors. On the marshes, in good years, a cow is reckoned to yield from 140 lbs. to 240 lbs. of butter. In 1817 there were 1,564,355 head of sheep. Malchus estimates their present number at 1,611,284 head; and the yearly produce of wool is said to be 3,224,000 lbs., two thirds of which are exported. The price of the wool varies from 8 to 90rix-dollars per centner (not including

* The forest-land of Hanover is distributed as follows: — Hanover, 177; Braunschweig, 335; Lüneburg, 117; Stade, 51; Osnabrück, 112; Aurich, 66; Hays, 8.

the coarse wool of the *Stadtschweiken*). Bees are a favourite addition to a farm throughout the kingdom, and thrive well, on account of the quantity of flowering heath and buck-wheat in the sandy districts. The annual produce of honey is valued at 40,000. Large flocks of geese are kept in moist situations: their flesh is salted for domestic use, and the feathers are preserved. Leeches, which formerly abounded in the marsh-lands, have become nearly extinct, from being too eagerly fished. Fish are caught in all the ponds and rivers, and contribute to the support of no small number of the poorer orders. The herring and cod fisheries at Emden used to employ about 1,500 hands, taking 13,000 tons annually; but the produce at present is not one third part of its former amount.

Mining Industry. — This is the most extensive branch of Hanoverian industry; and there is little doubt, that if the government would abandon the mischievous and absurd plan of keeping the mines in its own hands, and administering them by an expensive establishment of officers (*die Berghandlung*), who have no sufficient stimulus to increase their productiveness, they would, in the hands of private speculators, become much more productive, and employ many more hands. At present, out of 30 mines in the Upper Harz, only 6 are worked; and the amount of ore, at an average of 10 years, was 1,647,023 cwt. yearly, produced at an expense of 877,700 rix-dollars, and realising a nett revenue to government of only 633,100 dolls. 1 The Ilarz mines at Clausthal, Tellerfeld, and Andreasberg are worked exclusively by the Hanoverian government, and, if not very profitable, are carried on upon an expensive scale. One of them (Sumpson pit) is 1,500 ft. deep, and many attain to a depth of 700 and 800 ft. The ore of Clausthal is very rich in lead, yielding 75 per cent., and from 1½ to 4 per cent. of silver; the ores of Andreasberg, however, produce from 6 to 11 per cent. of silver. The mines of the Rammelsberg, near Goslar, are worked by the states of Hanover and Brunswick jointly (the shares being 4-7ths to the former, and 3-7ths to the latter). Silver, copper, and lead are produced in tolerably large quantities, and sometimes gold is found. In these mines, 1 cwt. of lead ore yields 7 lbs. of lead, and 3-16ths of an oz. of silver; and the same quantity of copper ore, 14 lbs. of copper and 3-32nd of an oz. of silver. An average of 5 years' produce from these mines gives 301,230 cwt. of all kinds yearly. The total produce of the lead and copper mines of Hanover is said by Reden (i. 205) to average 10 marks of gold, 50,000 marks of silver, 100,000 cwt. of lead and litharge, 2,500 cwt. of copper, and 50 cwt. of zinc. The iron mines of Hanover are not wrought by the government, but let out to speculators, who are obliged to deliver all the ore to the royal smelting-houses at such prices and quantities as will be accepted. Hence the production is very trifling, though the yield of ore be not less than from 40 to 60 per cent.

Thus mines, the produce of which might enrich the kingdom to a very great extent, are, by the absurd policy of its government, left to languish and decay. An average of 5 years gives only 290,000 cwt. as the produce of the rich iron ore so extensively spread through the hilly districts of Hanover. The salt-works, as well as the metallic mines, are, most of them, under the stepmother care of government. They employ 490 hands, and furnish 290,000 cwt., yielding a yearly gross revenue of 874,000 rix-dollars, with a clear profit of 80,000 rix-dollars. (Reden, i. 224.) Coal is found in many different localities on the hills that divide the Weser from the Leine, and, with greater convenience for transit, it might be made available for every want of a mining district. At present, however, only 2,260,000 cubic ft. are worked yearly. (Reden, i. 224—226.) The smelting-houses use coke and wood.

Manufactures. — Hanover, though furnished, by its mineral wealth and navigable rivers, with means for carrying on a considerable commerce, holds a very low station among the trading countries of Europe. Its inhab. have little enterprise or ardour for business, and even that which they might exert is effectually checked by restrictions. Most of their manufactured goods are produced at such an expense as to exclude them from the foreign market, and those which go abroad command only inferior prices. The manufacture of linen is, perhaps, more extensive than any other. Few, however, of the improved methods by machinery have been introduced, or can be introduced on the present system. There are only 2 spinning-mills in Hanover, and it is believed that no weaving machinery whatever, of very modern date, is used. Spinning and weaving form the great indoor employment of the rural pop., and hence large quantities both of yarn and thread are the work of private hands. In Grönberg, for instance, where large crops of flax are raised, no less than 1,875,000 skeins (450,000 lbs.) are spun annually by the farmers' and peasants' families. The number of professional weavers is nearly 5,000, using 7,200 looms, and the linen cloths produced

by them are known in the markets by the name of Osnaburgs and white rolls, there being different qualities of each. The hempen cloths are known as Tecklenburgs, hempen bagging, and Hessians. They are commonly made up in pieces of 100 double ells (128 yds.).

Price of Hanoverian Linens per Piece, in 1826 and 1836.

Names in English Market.	Length Piece.	Breadth.	1826.	1836.
Osnaburg, prime	128 yds.	27 to 28 inches	Rix doll. 19 to 23	Rix doll. 25 to 27
Do. 2d	—	26 — 27	15 — 19	16 — 24
Do. 3d	—	24 — 26	11 — 15	14 — 16
Do. 4th	—	23 — 25	9 — 10	9 — 12
Strümpfen-Jeinen (white rolls)	60 ells	28 — 30	3 — 4	4 — 6
Tecklenburgs	128 yds.	27 — 28	19 — 23	21 — 25
Stout do.	—	26 — 27	11 — 17	14 — 20
Cotton bagging	84 ells	42 — 46	1 — 1	1 — 2
Hessians	58 —	(32 — 34) (38 — 40)	3 — 5	3 — 5

These cloths, when bleached and ready for sale, are taken to the various *Lagge-Anstalten*, or cloth-marts of Hanover (chiefly in the district of Osnabrück), where, after being measured, stamped, and valued, they are bought, chiefly by Bremen and Hamburg merchants, who export them to England, Spain, and Portugal, N. America, and the W. Indies.

The linen and hempen cloths entered for sale in the four years ending with 1838 were as follows:—

Years.	Quantities.	Value.
	<i>Ells.</i>	<i>Rix dollars.</i>
1835	15,960,000	1,519,800
1836	19,182,000	1,988,400
1837	18,682,000	1,713,900
1838	19,936,000	1,856,210

Besides these, a large quantity, both of cloths and flax, is brought up without entering the market at all, and nearly the whole is exported. The total yearly value of the linen and linen yarn exported from Hanover is estimated by Reden (l. 364.) at 2,600,000 rix-dollars. The manufacture of cotton cloths, in Hanover, is of recent date, and is chiefly owing to the erection of a cotton spinning-mill at Hanover: it keeps at work about 600 hand-loom weavers, who, when fully employed, gain about 100 rix-dollars a year, and manufacture 2,200,000 ells of coarser cotton cloths. The tariff of 1835, in the view of encouraging the linen manufacture, taxes the importation of bleached yarn and unbleached linen cloths at the rate of 1 rix doll. per centner, and finished cloths from 8 to 12 rix-dollars per centner. Flax, hemp, and unbleached linen yarn may be imported duty free. (Reden, l. 364.) The woollen manufactured cloths are reckoned at 28,000 pieces, value 800,000 rix-dollars. The paper, made in 52 establishments, employing 1,000 workmen, amounts to 30,000 *ballen*, yearly value 360,000 rix-dollars. There are no other manufactures of any importance.

Trade.—Though seemingly destined by its situation in the valleys of three navigable rivers, to command a large import and export trade, Hanover exhibits little disposition to exchange its goods with foreign nations. The merchants of Hamburg and Bremen buy, in the Hanoverian markets, goods suitable for re-exportation; but the Hanoverians themselves take little interest in shipping their own goods for foreign ports. The number of their vessels entering Bremen and Hamburg, in 1838, was only 76 and 41 respectively; nor is it probable that there will be any great increase till the vexatious disputes about river privileges between the Hanoverian government and the Hulse Towns, are ended, and the restrictions imposed by both wholly removed. In 1838 there belonged to Hanover 422 sea-going ships, of the burden of 31,730 tons; and of these, 400 belonged to the ports of the Ems. The exports in 1838 were, manufactured linens and woollens, worth 1,800,000 rix-dollars; linen yarns, 500,000 do.; raw flax, 140,000 do.; raw wool, 500,000 do.; mineral produce, 500,000 do.; horses and cattle, 450,000 do.; wheat and other grain, 300,000 do.; butter and cheese, 34,000 do.; tobacco (manufactured), 260,000 do.; timber, 107,000 do.; sundries, 338,000 do.; total, 5,099,000 doll.

The chief imports of the kingdom are English manufactures (such as cotton and woollen, hardware and cutlery), colonial produce, wine and spirits. The table of returns, however, as given by Von Reden, is very unsatisfactory, and conveys no intelligible idea of the trade of Hanover. The following are said to be the quantities of the chief articles imported in 1837-38:—Coffee, 49,290 centners; sugar, 34,363; tea, 3,769; tobacco (raw), 48,445; iron, 82,868; toys, jewellery, &c., 187; cloth manufactures, &c., 7,349; pitch and tar, 24,708; wine and spirits, 77,547; horses and live-stock, 12,419 head.

Coins, Weights, and Measures.—By the new mint regulations of 1834, the coinage has been fixed as follows:

1 George-pistole	=	16s. 4d. Eng.
1 Williams-pistole	=	8s. 2d. —
1 ducat	=	4s. 6d. —
<i>Silver.</i>		
1 thaler	=	24 groschen = 2s. 11½d. Eng.
1 thaler	=	4 — — — — — 5½d. —
<i>Weight.</i>		
1 zentner	=	46½ kilog. = 103 lbs. avoird
1 pfund	=	46½ gram. = 1.937 lb. —
1 loth	=	14½ — = 1 lb. 4 oz. —
<i>Measure—Length.</i>		
1 foot	=	12 sollen = 11½ Eng. inches
1 ell	=	24 — = 639 Eng. yard.
1 rolt	=	16 feet = 5.1 Eng. yards.
1 mille	=	22,400 feet = 4.6 Eng. miles.
<i>Surface.</i>		
1 sq. foot	=	.92 Eng. square foot.
1 morgen	=	.64 Eng. acre.

Inland transport for goods has hitherto been effected either by tow-boats on the rivers, or by waggons on the roads; but the carriages are of so primitive and clumsy a description, and the roads so bad, that the expense of time and labour is wholly incommensurate with the value of the articles. A railroad has lately been projected from Hanover through Brunswick to Hamburg; but it seems very doubtful whether it will be accomplished.

Condition of the People.—Although the soil and climate of Hanover be so unfavourable to agriculture, the condition of the peasantry in the hereditary provs. of the house of Brunswick has, until very lately, been such as to confine them almost exclusively to the cultivation of the soil: indeed, the trading resources offered by the rivers of the kingdom are only beginning to be appreciated by the people. In the sandy districts, the pop. is necessarily scanty, and indigent even to wretchedness: in the better soils of Hildesheim, Göttingen, and Grubenhagen, the peasants are in a better condition, but still very poor. The most prosperous districts are K. Friesland, and the rich lands along the Elbe, where good agriculture, united with activity and enterprise in trade, serves to enrich the pop. The people are everywhere industrious and labouring, and cheerful, and cheerful for the smallest possible remuneration. They are mostly descendants of the ancient Saxons, and, as such, speak the Low German dialect, excepting the inhab. of the Harz, who came from Upper Germany. And we may remark, by the way, that the circumstance of the language of the peasants differing from that of the educated classes, in which all intellectual progress takes place, operates powerfully to keep back the former, and is a serious impediment to the admission of the lower classes to a participation in the government, through their representatives.

Government.—Before Prussia ceded Hanover to France, in 1804, the form of government was monarchical, and the various territories were subject to feudal lords. The peasants of the marsh-lands had more freedom, and in K. Friesland the constitution of the country was almost republican. In the territories of the princes of the empire, the representation of the people by estates, composed of the nobles, prelates, and deputies from the towns, served to check the power of the sovereign, as in other parts of Germany. In 1806, when Napoleon created the kingdom of Westphalia, the territories of Hanover, with the districts of Hildesheim and Osnabrück, formed a part of it, and the Code Napoléon took the place of the ancient laws, and a sham representative government was established. On the return of the rightful sovereign to Hanover, in 1813, the French institutions were summarily abolished, and the old forms re-established; and in 1818 the estates, summoned upon the ancient footing, drew up the form of a new constitution, modelled on that of England and France, and substituting a uniform system of representation for the various representative forms which prevailed under the empire. The chief change that excited disapprobation arose from the arbitrary decision of the sovereign (George IV.), advised by Count Munster, that there should be two chambers instead of one, contrary to the proposal of the estates, and the universal custom of Germany. The respective rights of the sovereign and of the country to the crown land revenues were not clearly defined by this fundamental law; but the interests of the people were supposed to be sufficiently consulted by the institution of a national treasury, the commissioners of which, named for life, were *ex officio* members either of the upper or of the lower chamber.

This constitution, however, contained no properly defined statements respecting either the rights of the people, or the prerogatives of the crown; and as the new system of representation was not sufficiently consolidated to resist the encroachments of a monarch supported by powerful foreign influence, the necessity of a more definite fundamental law, in which the rights of

the citizens should at least be declared, was felt on all sides. This feeling led to the drawing up of the constitution of 1833, which differed in but few, though most essential, points from that of 1819. The principal points of difference were a fuller acknowledgment of the right of the chambers to control the budget, and to call the ministers to account for their conduct; the restriction of the king's expenditure, by a regulated civil list; and the reservation, for the use of the nation, of the surplus revenue of the crown demesnes. These modifications rendered the treasury, whose functions thus devolved upon the chambers, wholly unnecessary; and it was dissolved. The new fundamental law, after being discussed by both chambers, received the assent of William IV. in 1833, who, however, by the same act, modified 14 articles of the bill. New elections followed, and the new chambers were exhibiting their activity in reforming abuses, and introducing economy into the state disbursements, when the death of William IV. interrupted their proceedings. As the said law, excluding females from the succession to the throne, prevails in Hanover, William IV. was succeeded by his eldest surviving brother, Ernest, Duke of Cumberland, in England. Immediately on taking the government, the new king declared the chambers dissolved; and previously to their re-assembling, he abolished, by proclamation, the fundamental law which had been adopted under the reign of his predecessor, and in the most arbitrary manner, insulting alike his brother's memory and the whole country, declared the fundamental law of 1819 to be alone valid. Under the last-named law, he summoned a fresh parliament: but he found the spirit of the nation aroused and indignant; for not only the courts of law, but the highest legal authority in Germany, and several faculties of universities, declared his proceedings illegal; many towns refused to send representatives to the parliament, and those which met signed a memorable protest, declaring their opinion that the fundamental law of 1833 was still the law of the land. As the chambers could not be convened, for decency's sake, they were declared dissolved.

In this state of things, the present government of Hanover is managed by authorities partly belonging to the period of 1819: the independent treasury, however, no longer exists, not having been reinstated by the king, when he abrogated the law of 1833. The privy council, too, which met to advise the king on state affairs, in the same manner as that of England, has been arbitrarily abolished; and a cabinet council, composed of the king's ministers and creatures, has been appointed in its place. This council, like a new star-chamber, has on one occasion even arrogated the novel power of assuming a judicial control over the supreme court of appeals at Celle. As none of the decrees which the king, under the advice of this authority, has issued since his accession have received the sanction of the chambers, the legislative power is at present vested in the council of state, or rather in its president the king, who may be said to be the absolute monarch and despot of Hanover. Except this degradation of the supreme court of appeals at Celle, no change has hitherto been made in the judicial arrangements, which consist of 9 chanceries or district courts, besides the magistracies of the towns, and the manorial and minor royal courts, as primary tribunals.

Religion and Education.—The pop., considered in respect of religious creeds, is thus divided (not including the military):—Lutherans, 1,356,000; Calvinists, 102,850; Roman Catholics, 212,300; Jews, 11,000; Mennonites, 1,850. The Roman Catholics chiefly reside in the principality of Osnabrück and Hildesheim: their number is small elsewhere. Religious matters are directed by Calvinist consistories at Hanover, Stade, Aurich, and Nordhorn, with the subordinate consistories of Hadeln and Neustadt; the Lutheran consistory at Osnabrück, and the Roman Catholic consistory of the same see, which is alternately filled by a Roman Catholic and by a secularised Protestant bishop; lastly, the bishop and consistory of Hildesheim, for the Roman Catholic inhab. of that district. Education has been much attended to in Hanover; but, as was before stated, it is not carried on in the dialect most familiar to the people, the instruction being universally in the High German tongue.

The following table shows the distribution of elementary schools in Hanover.

	Protestant.		Rom. Cath.		Prop. of Child. ed. to Pop.
	Schools.	Scholars.	Schools.	Scholars.	
Hanover	503	44,199	10	745	1 in 7
Hildesheim	543	39,046	117	7,166	— 7
Lüneburg	532	39,443	1	35	— 8
Stade	558	59,139	1	55	— 7
Osnabrück	172	15,401	215	17,192	— 8
Aurich	598	19,970	2	189	— 7
	3,068	180,197	315	25,527	1 in 7
Total of schools, 5,428		Do. scholars, 214,524			

The teachers for these schools are prepared for their duties in 6 normal schools, established in principle at Hanover, Hildesheim, Stade, and Osnabrück. Besides this provision for the education of the lower orders, there are 17 gymnasia and higher schools, taught by 153 masters, and attended by 2,200 scholars, and also 13 elementary grammar-schools, taught by 71 masters, and attended by more than 2,000 children. These schools prepare youth for the university, or for the various callings of life. The university of Göttingen, which was one of the best attended of Europe a few years back, and counted from 1,500 to 1,800 students, has now scarcely 500. The greatest loss is, however, that of its moral influence over the institutions for education, occasioned by the dismissal of 7 of its most respected professors, for expressing their doubt of the king's power to abrogate subjects from their oaths. (See GÖTTINGEN.) The press is under a censorship, the mildness or severity of which depends on the character of the monarch; and this censorship affects the public libraries, as well as publishers and editors of newspapers. The coercive measures of King Ernest's government have been very unpopular.

The poor are provided for by voluntary contributions procured for them, at stated periods, from the wealthier inhab. They are, in a great degree, supported in workhouses built and maintained by subscription, where their own labour contributes in some measure to their subsistence. Their food and clothing are of the coarsest description; but, on the whole, they are as well taken care of as in some countries burdened with poor-rates.

Condition of People.—Most of the Hanoverians are of Saxon origin; but in the N.W. there are Frislanders, and in other parts, more or less Thuringians, Franks, and Vandals. The people are generally strong and well built, industrious and persevering. The distribution of the land into small estates has produced a good deal of family pride even among the peasants; and it is considered discreditable to intermarry with families in inferior circumstances. The rural pop. in the S. provinces is much more advanced in civilisation than in the N.; but there is every where a great disinclination to adopt improvements in farming. The great majority of the men are not labourers, and even the richest live in the plainest style, except in the duchy of Bremen and the Hadeln-land, where mahogany furniture is to be seen in their houses, and four or five sleek Holstein carriage-horses in their stables. In these districts the country people are very frank and hospitable; but they are equally obstinate with the rest in their adherence to ancient fashions. Beer is the favourite beverage: some occasionally produce wine. The national dishes of the Hanoverians are smoked geese, beef and raisins, and pork served with dried fruit.

Taxation.—The changes of the government of Hanover have necessarily, and in the most important degree, affected its finances. The re-establishment of the ancient order of things, in 1813, brought upon the country the whole mass of abuses belonging to a past age, which had been abolished by the French. Amongst the most obnoxious was, the claim of the nobles to exemption from the land-tax; and this, as well as many other points, had to be arranged by the estates assembled under the constitution of 1819. Between 1821-26, a measurement and valuation of the country and its soil was made; and the amount of annual produce, after deducting expenses, being taxed at 10·2 per cent., was calculated to yield 1,310,000 dols.; but in this loose estimate, the values undoubtedly fell much below the reality. An indemnity was, at the same time, granted to the nobles, in lieu of exemption, to the amount of 1 per cent. on the revenue taxed. This charge appeared in the budget of 1826-27, and amounted to 65,000 dols. The revenues claiming exemption amounted, consequently, to 6,500,000 dols., nearly equalling the amount of taxable property belonging to peasants and burghers, and which, in 1816, was found (exclusive of E. Griesland) to amount to 6,689,717 dols. Thus, half the nation was obliged to purchase justice from the other half, after the re-establishment of the so-called constitution of 1819 had been granted. The other direct taxes are the house-tax, which is 4 per cent. on the appraised rent; the personal tax, rated in 6 classes; an income-tax, which likewise includes all salaries, and the rate of which is 1 per cent. below 500 dols., rising to 2 per cent. above 2,000 dols. annual income; and lastly, the industry-tax, which is paid by all tradesmen, in 7 classes, the lowest paying 1 dols., the highest 80 dols.

The indirect taxes include the customs, the tax on spirits, beer, &c., the monopoly of the sale of salt, the stamp and legacy duties, besides duties levied on the grinding of corn, and unslaughtered beasts. The royal and national revenues amounted, in 1838-39, to 6,665,140 rix-dolls.; and the expenditure, during the same period, was 5,581,850 rix-dolls., leaving a surplus of 984,290 rix-dolls., which was devoted to the payment of the public

debt, together with a further surplus of 280,000 rix-dollars of the previous year.

The estimate for 1840 is,—

	Dollars.	Dollars.
Nett revenue from domains - - -	1,113,111	
Mines, &c. - - -	126,000	
Tolls at Stade, &c. - - -	400,000	
Tolls on roads - - -	230,000	
Post-office - - -	140,000	
Lottery and sundries - - -	256,455	
Direct taxes - - -	2,173,300	
Indirect taxes - - -	1,382,269	
Sundries - - -	188,887	
		6,015,022
King's civil list deducted from the proceeds of the crown lands - - -		513,888
		6,518,911

The expenditure for the same year was estimated at 5,872,889 dollars, without including the civil list. In 1837 the expenditure was 5,800,590 dollars. The national debt is said, by Abbeholde, to amount to 15,031,283 doll. 20 gr.; according to later accounts, it is 19,255,000 dollars. Thus the revenue is in a flourishing state, but Hanover is one of the heaviest taxed countries of Germany, especially if the large income drawn from the crown lands be considered.

The kingdom of Hanover ranks as the fifth state of the German confederation, and has 1 vote in the smaller assembly, and 4 votes in the full assembly, of the diet at Frankfurt.

Army.—The contingent of Hanover to the confederate army is 13,050 men, belonging to the 10th division; but the whole army consists of above 20,000 men, and bears a proportion to the whole pop. of 1 to 83.

	Mcn.	Horses.
Military staff - - -	45	
Engineers - - -	198	
Artillery, 2 companies horse-art. - - -		
2 battalions foot - - -	1,368	275
1 company pioneers - - -		
Cavalry, 3 regiments - - -	5,310	2,445
Infantry, 16 regiments - - -	15,580	
Total - - -	20,501	2,720

There are 10 garrison towns, a cannon-foundry at Hanover, and a manufactory for small arms at Herzberg. The expense of maintaining the army is about 1,500,000 rix-dollars yearly.

History.—The kingdom of Hanover is formed out of the duchies formerly possessed by several families of the junior branch of the house of Brunswick. The reigning family derives its origin from the union of the Marquis d'Este, in the 11th century, with a wealthy princess of Bavaria, the issue of which received the surname *Guelph*, from his maternal ancestors, and inherited the dukedom of Bavaria. Henry the Proud, third in descent from him last mentioned, married Gertrude, the ruling princess of Brunswick: their son, well known in the history of the crusades as Henry the Lion (born 1129), was the first *Guelph* duke of Brunswick. He married a daughter of Henry II. king of England; and from this marriage both the houses of Brunswick and Lüneburg are descended. The history of Hanover for the two centuries preceding the Lutheran reformation presents little interest, except in the connection of its princes with the wars of the Guelphs and Ghibellines, in the latter end of the 14th century: little or nothing is known of its internal history. The Reformation numbered the princes of Brunswick among its most zealous supporters, and their subjects, during the thirty years' war, warmly seconded their anti-papal efforts. Ernest of Zell, the reigning duke, was one of the most eloquent defenders of Luther at the diet of Worms. His endeavours to improve the people by establishing clerical and general schools, when learning was esteemed only by the few, show him to have been a man of enlightened views. His grandson, Ernest Augustus, married Sophia, a grand-daughter of James I. of England (by his daughter Elizabeth, the wife of the elector-palatine); and on this marriage was founded the claim of the elder branch of the house of Brunswick to the English crown, acknowledged by parliament in 1701. George Louis was the issue of this marriage, and became king of England in 1714; from which time till 1837, at the death of William IV., both England and Hanover have had the same sovereign. The salic law then conferred the Hanoverian crown on Ernest, Duke of Cumberland, fifth, but eldest surviving son of George III. The important constitutional changes during the last thirty years have been mentioned elsewhere. As respects other branches of its history during the reigns of George I. and II. the territory of the electors of Hanover was increased by the conquest and purchase of many adjoining districts; Bremenverden and Wildeshausen in

1719, the Hadeln-land in 1731, &c. Geo. III. added Hohenstein and the bishopric of Osnabrück, which, by the treaty of Westphalia, was held by his house as a secularised bishopric alternately with a Rom. Cath. prelate. In 1804, Prussia took possession of Hanover, but ceded it in the same year to the French, who constituted it a part of the kingdom of Westphalia, established in 1808. At the peace of 1813, the King of Great Britain reclaimed his rightful dominions, which were much enlarged by the stipulations of the treaty of Vienna, and formed into a kingdom. On the definitive settlement of the kingdom, the district of Lauenburg was ceded by Hanover, which obtained in return the bishopric of Hildesheim, the principality of East Friesland, the districts of Lingen, Harlingen, &c. A treaty of mutual inheritance has long existed between Hanover and Brunswick, which was formally renewed in 1836, and by which the Hanoverian crown is declared to descend to the dukes of Brunswick, on the extinction of male heirs of the line of Hanover.

HANOVER, a city of W. Germany, cap. of the above kingdom, on the Lohre, a branch of the Weser, 84 m. S. Hamburg, 62 m. S.E. Bremen, 85 m. W. Brunswick. Lat. 52° 29' 28" N., long. 9° 44' 40" E. Pop. (1835) 24,000. It is built in an extensive sandy plain, and is divided by the river (over which are several bridges), into an old and new town, each of which is governed by a separate magistrate. The old town, on the right bank, has crooked and narrow streets, and is ill built and dirty: the streets of the new town are more regular, and are lined with handsome houses, particularly George Street and Frederick Street, opening on a fine esplanade; the latter is adorned with the handsome monumental rotunda of Leibnitz, and the column, 156 ft. high, sacred to the memory of the Hanoverians who fell in the battle of Waterloo. The chief public buildings are the royal palace, of good exterior architecture, and splendidly fitted up within, especially the *Ritter-saal*, or knights' hall; the opera-house attached to the palace; the viceroys' palace: the house of assembly of the states (*Landständehaus*); the mint; the arsenal; the *Gewerb-schule* (trade school); the royal stables, where the well known breed of black and cream-coloured Hanoverian horses is kept; and the town-hall and record-office, containing a library of 80,000 printed books, besides about 2,000 valuable MSS., chiefly given by Leibnitz, who was a great benefactor to this town. Besides this, there are here seven other public libraries attached to various national establishments. (*Von Recken*, ii. 463.) There are 7 churches, 4 Lutheran, 2 Calvinist, and 1 Rom. Catholic: of these the handsomest are the court and city church in the new town, and the *Schloss-kirche*, which contains the remains of the Electress Sophia and her son George I., King of England. Outside the town are 2 suburbs, Linder and Gartengemeinde, in the latter of which are upwards of 800 houses, with gardens, &c. About 1 m. distant is Mount Brillant, the king's country residence, and formerly the seat of Count Walsleben, who enriched it with a gallery of fine pictures. About 1 m. distant is the old palace of Herrnhausen, once the favourite residence of George I. and George II.: it is heavy and tasteless, and appears to be going to decay. The gardens, which are laid out in the old French style, formerly contained a fine collection of rare plants; but they were dispersed during the late war. Hanover has several establishments for education, among which are the Georgianum, founded in 1776, for educating 40 sons of the nobility free of expense, the lyceum, the normal school (the earliest of its kind, founded in 1754), several elementary schools, and a girls' school of industry. Among the charitable institutions are a large almshouse, an orphan asylum, and several hospitals, one of which has been only lately erected. There are also, a Bible Society founded in 1806, a Soc. of Nat. Hist., an Hist. Soc., an Art. Union, which annually exhibits specimens of Hanoverian art, and a trade union. The manufactures consist mostly of oil-cloth, gold and silver articles, with beer, leather, tobacco, chicory, &c.; but they are of trifling importance. The transit trade with Bremen and the interior of Germany is very considerable: there is an exchange, a chamber of commerce, and a *Berghandlung*, or market for mining produce. Commercial activity, however, prevails more among the Dutch and foreign German merchants settled in the town than amongst the Hanoverians. Some of the bankers are considerable capitalists. The town is not considered healthy: N. and E. winds are prevalent, and much rain falls. Longevity is said to be rare.

The foundation of Hanover, though attributed to the eleventh century, is most probably of still earlier date. In 1033 it is mentioned as having some trade in cloth, skins, and salt. Little more is known of it till 1536, when its inhabitants distinguished themselves by their zeal in the Reformation. It escaped the devastations of the thirty years' war, and even refused admission to the victorious troops of Tilly in 1626. The town palace was built early in the 17th century, and in 1641 it became the residence of the Duke Christian Louis, since which it

has always been the capital of the electorate and kingdom, and has made great advances in size and splendour. The ramparts being found useless as a means of defence, were in 1780 converted into a handsome esplanade, and planted with trees. (*Bergkhus; Stein; Von Reden.*)

HARBOROUGH (MARKET), a market town and chapelry of England, par. St. Bowden, co. Leicester, hund. Garrow, on the N. bank of the Welland, which divides it from Northamptonshire, and, m. S. E. of Leicester. Pop. of town in 1831, 2,272. It consists of a well-built street, crossed by several others of inferior character; and near the middle of the town is a handsome town-hall, with shops below, and a justice-room above, in which the county magistrates transact their business. The church is fine and spacious, and its octagonal spire is one of the most elegant in England. The dissenters have 3 places of worship, attached to which, as well as to the church, are Sunday schools, giving instruction altogether to about 600 children. Considerable trade takes place on the market-days and at the October fairs; which, not less now than in the time of Camden, are famous for the show of beasts. Silk and shalloon weaving, and the manufacture of carpets are carried on here, but not extensively. One mill is returned as working 2 engines, and employing 103 hands. (*Parl. Rep.*) Market-Harborough is one of the polling-places for the S. division of the co., and is the chief town of a poor law union, comprising 41 parcs or townships. Markets on Tuesdays; fairs Jan. 1, Feb. 16, April 29, and July 31, Oct. 19 and 8 following days, for cattle, leather, cheese, &c. Other fairs are held on the Tuesdays after March 2, after Midlent Sunday, and before Nov. 22, and Dec. 8.

HARLINGEN, a sea-port town of Holland, prov. Friesland, on the Vliestrome, or entrance to the Zuyder Zee, opposite the Texel, and at the mouth of the canal of Leeuwarden, 15 m. W. by S. that town. Pop. nearly 8,000. It is pretty well fortified, and is strong by its position, the surrounding country being readily laid under water. Streets regular, well built, clean, and intersected with canals bordered with trees. Chief edifices, the Admiralty, a large par. church, and the town-hall. It has a good harbour; but the entrance to it is blocked up with sand-banks, so as not to admit large vessels. It has manufactures of sail-cloth, salt, hollands, paper, bricks, and lime, with building docks, and a brisk trade in corn, butter, cheese, flax, hemp, glue, pitch and tar, &c. It is the seat of the naval office for the prov.; and suffered severely from a violent storm in 1825.

HARROW-ON-THE-HILL, a village and par. of England, co. Middlesex, hund. Gore, 10 m. N.W. by W. London. Area of par., 13,600 acres. Pop., in 1831, 3,861. The hill on which the village stands rises singly out of an extensive and fertile vale; it is considerably depressed in the centre, but has two very conspicuous eminences at the extremes. On the more N. of these stands the church, with its tower and spire, a prominent feature throughout Middlesex and some of the adjoining counties. Part of this building is Norman, belonging to the 11th century; but the main fabric, with the tower, belongs to the 14th century. The living is a vicarage, in the gift of Lord Northwick. Immediately below the church lies the village, chiefly consisting of one street running down the slope of the hill. The best houses are mostly occupied either by assistant-masters, or others, who accommodate the scholars attending the free school, to which Harrow is wholly indebted for its celebrity. This school was founded, in 1571, by Mr. John Lyon, a wealthy yeoman of the neighbouring hamlet of Preston, and received a royal charter, by the terms of which the management of the property and the appointment of the master were committed to six trustees as a body corporate. The school-buildings are of brick, and have no claim to particular mention. The head master's house has a Gothic porch, and is a fine old mansion. The primary object of this establishment was the gratuitous instruction of the poor children of Harrow, without limitation of number; but the founder expressly directs "that the master may receive, over and above the youth belonging to the par., as many *foreigners* as can be well taught and accommodated, for such stipends and wages as he can get, so that he take pains with all indifferently, as well of the par. as foreigners, as well of *poor* as of *rich*." This liberality of the founder, and the judicious choice by the trustees of able and learned men as its masters, have chiefly conducted to its present very high reputation as a school for the English aristocracy; but, at the same time, there can be no doubt that the founder's intentions, as respects the poor of the par. itself, have been wholly frustrated. A classical education is quite unsuitable to the pop. of a village, and hence the school has been little used of late years by the parishioners. A petition of the latter to the Court of Chancery, in 1810, for the reformation of these abuses, was unsuccessful. (See *Vesey's Chancery Reports*, xvii. 498.) The revenues strictly applicable to the school amount to nearly 900*l.* a year, in the

hands of trustees, usually noblemen or gentlemen living in or near the par. The education furnished was exclusively classical till within the last few years, when Drs. Butler and Longley ventured to introduce a little modern history and arithmetic, neither of which, however, is considered at all important: beyond these trifling attempts at reform, we are not aware that any deviation has been made from the beaten path of the old grammar-schools. The routine of grammars, classes, hours, &c. very much resembles that pursued at Eton, owing, no doubt, to the appointment of several head-masters from that school: the Eton grammar is used, verse-making supersedes the more useful study of prose composition, learning-by-heart is a favourite employment; and the pernicious private-tuition system, the chief object of which is to save the master's labour, and fill the tutor's pocket, prevails at Harrow no less than at Eton and Westminster. The masters originally were two only, the master, and the *saker* or under-master, both of whom were permitted to take "*foreigners*" as boarders; but as the school increased, further assistance became from time to time necessary, and there are now six assistant-masters, paid either by the high or lower master, according to the school in which they teach; and besides these there is a mathematical teacher. All the masters receive boarders; but the head-master does not furnish tuition, and hence arises the difference in the terms; for at a tutor's house they amount to 130*l.*, whereas at the head-master's they are little more than 100*l.* All, however, are compelled to procure tuition, which is a part of the system. At least 60*l.* a year must be added to complete the necessary annual expenses of boys educated at this school. The governors have given prizes for verses, and Sir R. Peel (an old Harrovian) has lately established a prize for Latin prose composition, besides which the head-master has voluntarily given rewards for composition. The speech-days, on which these papers are read or recited, are the first Wednesdays in June and July. The University scholarships attached to Harrow-school are four, established by the founder, of 50 guineas each, either to Oxford or Cambridge, and two of the same value, founded by the late Mr. Sayer, to Caius College, Cambridge,—all tenable for *four* years: they are gained by an impartial examination. The number of boys attending the school fluctuates at present between 350 and 420. Among the many public characters educated in this school may be mentioned Sir William Jones, Spencer Perceval, Dr. Parr, Lord Byron, Marquis of Hastings, and Sir Robert Peel. Harrow had formerly a weekly market, which is now decayed; but a pleasure fair is still held on the first Monday in Aug. Bentley Priors, a fine seat belonging to the Marquis of Abercorn, is within this par.: it occupies the site of a monastery, dissolved at the Reformation.

HARROWGATE, a village of England, celebrated for its mineral waters, co. York, W. riding, wap. Clare, forming with Bitton a chapelry of the par. of Knaresborough, 17 m. N. London, 14 m. N. Leeds, and 20 m. W. by S. York. Area of chapelry 4,800 acres. Pop. of ditto, in 1831, 2,812. The village is divided into High and Low Harrogate. High Harrogate is built on an elevated plain, which less than 100 years ago was properly described by Sinclott as "a wild common, bare and bleak, without tree or shrub, or the least signs of cultivation." At the close of last century, however, Lord Loughborough made large plantations; houses have since been built in different directions; and the situation is now extremely pleasant, commanding a most extensive view of the distant country, finely varied by towns, villages, fields, and woods. The cathedral of York is distinctly seen at the distance of 20 m., and the view W. is terminated by the mountains of Craven, and E. by the Hamilton Hills and Yorkshire wolds. The air is pure and bracing, and the climate dry and salubrious. Low Harrogate is situated in a valley, and has many handsome stone buildings, erected either for hotels or private lodging-houses for visitors. An almost continuous series of these houses unites the upper and lower parts of the village. The church of High Harrogate is a well-built structure, erected in 1749 by subscription: that in the lower village was built in 1824. There are besides two chapels for Independents, and one for Wesleyan Methodists. A bath hospital was erected in 1826, which has been lately enlarged: it accommodates about 40 patients, who have the benefit of the waters free of charge.

The springs of Harrogate are both chalybeate and sulphureous. The chalybeate springs rise in both villages, the sulphur springs only in Low Harrogate. The following analysis gives a tolerably correct idea of their chemical composition. [See top of next page.]

The chalybeate waters are principally tonic and alterative, the sulphureous waters strongly purgative. The latter are also used externally in rheumatism and scrofulic cases. The wells are covered with elegant cupolas, and surrounded by promenades, for the accommodation of those who come to drink the waters. Bathers are held in summer on the high ground to the W., where also is

a high tower or observatory, from the top of which is a very extensive prospect of the surrounding country. (*Allen's Hist. of Yorkshire; Dr. Hunter on the Harrogate Waters.*)

HARTFORD, a town or city of the U. S., Connecticut, of which it is joint cap. with Newhaven, co. Hartford, on the W. bank of the Connecticut river, 50 m. from its mouth, and 32 m. N.N.E. Newhaven; lat. 41° 46' N., long. 72° 50' W. Pop. (1830) 7,074. It is advantageously situated, the river being navigable for sloops up to this point. It is generally well built, particularly the main street, and is connected with E. Hartford, on the other side of the river, by a bridge of 6 arches, 974 ft. long. It has a handsome state-house, 3 banks, *including a branch of the U. S. Bank, an arsenal, academy, museum, college, 9 places of worship, and an asylum for deaf and dumb. The last named, the first institution of the kind established in America, was founded in 1817; and in 1819 was presented with a grant of 23,000 acres of land by congress; besides which it is possessed of other donations and sources of revenue. It is open to patients from the whole union, at a charge of only 115 dollars a year, and many are provided for and educated gratuitously. It occupies a large and commodious brick building, on an eminence about $\frac{1}{2}$ m. W. of the city; is surrounded by grounds between 7 and 8 acres in extent, and has attached to it some workshops, in which the male pupils are taught mechanical trades. In 1830, 318 persons had been received in it. A little S. of the town is an asylum for the insane, a spacious stone edifice, with extensive grounds. Washington Episcopal College, established 1826, is another of the public institutions at Hartford. It has a president, 8 professors, generally from 80 to 100 students, and a library of 6,200 vols. Hartford is the seat of the state assembly for Connecticut, alternately with Newhaven. It has manufactures of leather, shoes, woollen and cotton goods, saddlery, brass work, carriages, &c.; many printing houses, a large inland trade, and daily communication with New York by steam-boats and stage-coaches. In 1837, a railroad between Hartford and Newhaven was in progress. (*American Ensigns and Almanack, &c.*)

HARTLAND, a market town and par. of England, co. Devon, hund. same name, 44 m. W. N. W. Exeter, and 190 m. W. London. Area of par. 11,030 acres; pop., in 1831, 2,143. It is situated in a bleak district close to the borders of Cornwall, and 2 m. from the Bristol Channel, with which it is connected by a steep road that leads down to a quay lying under the cliffs, and much frequented by fishermen. The church, which stands on the cliffs, about a mile from the town, is a large building, and serves as a landmark to mariners. The inhabitants are employed in fishing and agriculture: the herring fishery on the coast is of some consequence, and the market is well attended. The town became a seaport by an act made in the reign of Elizabeth, and is governed by a portreeve. In a fine valley near it is Hartland Abbey, formerly a monastery of Black Canons, but now converted into a modern mansion. N. W. of the town is Hartland Point, a very high cliff, forming the W. boundary of Bideford Bay; and near it is a ridge of rocks, on which the sea breaks very heavily. Markets on Sat., fairs, Easter Wed. and Sept. 25, for cattle.

HARTLEPOOL, a town, par., and sea-port of England, co. Durham, ward Stockton, at the mouth of the Tees, 17 m. S. E. Durham, 16 m. S. by E. Sunderland. Area of par. 840 acres. Pop. of do., in 1831, 1,280. The town stands on a peninsula, connected with the mainland by a narrow neck at the N. end, which at high water assumes a crescent shape, stretching S. and S. W., forming a natural harbour, secure from the E. wind. The cliffs towards the sea N. are bold and abrupt, and their summits command a magnificent view of the sea, and the coasts both of Durham and Yorkshire. The town, which occupies the S. W. portion of the peninsula, consists at present of a principal street, Southgate, another behind it rising gradually from the old harbour to the moor, and several streets crossing them. A few other houses have

HARWICH.

been erected for the convenience of bathers. It was formerly fortified, as the old Durham gate and the ruins of walls abundantly testify. The church stands on a rising ground at the E. end of Southgate, and appears to have been built at different periods. Hartlepool is a chapelry, dependent on Hart, the next par.; but it was separated a few years ago. The free school was founded by John Crookes, in 1749, for the education of 30 poor children. The school-house was built in 1790, and the present annual value of the property is 284. At no great distance from town are two strongly fortified batteries, S. of which is the chalybeate spring. The old harbour is now choked up, and wholly useless, except to the fishermen. The present harbour, which lies S. of the town, is small, but has recently been much improved by the erection of a pier, 150 yards long, floodgates, &c., affording secure shelter for the smaller class of vessels. Fishing was until lately the chief occupation of the people, who are described as free, honest, industrious, and much attached to their town; since the opening, however, of the S. Durham coal-field, and the Clarence railway, Hartlepool has had a considerable share in the coal trade; and there can be little doubt that its prospects are improving. Hartlepool was governed by a mayor, aldermen, and common council, under two charters, granted by King John in 1200, and by Queen Elizabeth in 1593; but the power of the corporation was destroyed by the Municipal Reform Act in 1834. The local act by which the town is regulated is 53 Geo. III., c. 35. Markets on Saturday fairs, May 14. Aug. 31. Oct. 9. and Nov. 27.

Hartlepool is a very old town, and during the 13th and 14th centuries was a place of considerable importance. In the reign of Edward III. it furnished five ships to the royal navy, and was the second town of the county palatine of Durham; in later times, however, until very lately, it has been in a languishing condition. (*Surveys of Harwich, &c. Priv. Inform.*)

HARWICH, a market town, par. bor., and sea-port of England, co. Essex, hund. Tending, on a point of land at the S. E. extremity of the estuary of the Stour, 66 m. E. N. E. London, $\frac{1}{4}$ m. S. E. Ipswich; lat. 51° 58' 39" N., long. 1° 17' 30" E. The bor. includes the parishes of St. Nicholas and Dover-court. Area, 2,060 acres. Pop. in 1831, 4,297. There are three principal streets, and several smaller; the houses are of brick, and the town is well paved, and lighted with gas. The church, a large brick structure, with stone buttresses and steeple, was erected in 1821, on the site of an older building. The living is a perpetual curacy. The grammar-school was founded in 1730, for 32 boys, and the mastership has usually been given to the curate, with a house, and salary of 40*l.* a year. The principal public buildings are the town-hall, gaol, and custom-house. The old gates and fortifications were demolished during the late civil war, and there are very few traces of them. The harbour of Harwich is the best on the E. coast of England; the access to it is, however, a good deal encumbered with rocks, but ships properly navigated need apprehend no danger; there is water to float the largest men-of-war, and the harbour is at once capacious, safe, and commodious. It is said that 100 ships of war, and above 200 colliers, have been anchored here at the same moment. The excellence of the harbour, and its convenient situation, made Harwich be selected as the station whence the packets usually sailed with the mails for Hamburg and Helvoetsluis. The town is defended by a battery and by Landguard Fort, on the opposite side of the estuary. The entrance to the harbour is indicated by two lighthouses with fixed lights, and is well buoyed. The sea has made great encroachments on the peninsula on which Harwich is built; and the battery, which, when constructed, about 30 years since, had a considerable space of ground between it and the sea, is now partially undermined. (*Lyell's Geology*, i. 40, 3d ed.)

"The prosperity of Harwich has very much declined of late years. During the late war with France it was in a very flourishing condition, owing partly to the influx of strangers, who entered and quitted the kingdom at this place on their way to Hamburg and Helvoetsluis; partly to the convenience of its spacious harbour, its thriving fisheries, extensive government works, and the large garrisons kept up here and at Landguard Fort. Some of these advantages continued to a certain extent while the government packets to Holland, Germany, and Sweden were stationed here; but since their removal (consequent on the general adoption of steam mail packets), a great diminution has taken place, and the fishery has almost ceased. The effect of this is shown by the number of empty houses in the town, and by the depreciation in value of those which are still occupied. A manufacture of cement is carried on here; shipbuilding is also carried on by a private individual who rents the government dockyard, and the town derives little benefit from the visitors who frequent it in the bathing seasons. There is, under these circumstances, little probability of any increase in the size of the town."

(*Mun. Bound. Rep.*) There belonged to the port of Harwich, in 1836, 59 ships, of the burden of 5,572 tons. Harwich was formerly governed by a mayor, 3 aldermen, and 24 head burgesses, under the authority of a charter granted by James I. But under the Municipal Reform Act it is governed by a mayor, 4 aldermen, and 12 councillors. Corporation revenue, in 1839, 665*l*. Harwich returned 2 mems. to the H. of C. in the reign of Edward III.; but the privilege was very soon withdrawn, and not restored till the 12th of James I. The franchise was vested in the resident members of the corporation, and it was, in fact, a nomination bor., in the patronage of the existing government. Under the Reform Act, it still returns 2 mems., and its limits continue unaltered. Registered electors, in 1838-39, 167. The boundaries of the mun. and parl. bor. are co-extensive, and include the par.

The town is said to be of Roman origin, and in the time of the Saxons was used as a fortress. The earls of Norfolk were the lords of the manor, and through their agency its chief mun. and parl. privileges were originally obtained.

HARZ (*Silva Hercynia*, Tac.), a mountain-chain of Germany, on the S.W. frontier of Hanover, connected by low hills with the Thuringer-wald, a W. offset from the Fechtgebirge, the great centre of the German mountain-system. (See *GERMANY*.) It extends farther N. than any other chain, and immediately at its foot commences the great plain which stretches N. to the Baltic and from the N. Sea to the Volga. It is a mass of mountain-land rather than a succession of ridges, and has no summits so high as Snowdon in N. Wales; its length is about 60 m., and average breadth 24 m.: area, 1,350 sq. m. Mansfeld and Seesen are considered as the limits of the Harz; and it is divided into two sections by the watershed of the Weser and Elbe, which takes a direction from S.W. to N.N.E., and cuts the range at the Brocken (1,489 ft.). The higher summits are N.W. of the Brocken, and this section is, therefore, called the Upper Harz. It contains the chief mineral wealth of the range, and its forests consist of pines and other resinous trees. Its chief summits are the Heinrichshöhe, 3,419 ft., and the Königsberg, 3,307 ft. The lower Harz, which lies E. of the Brocken, is much less elevated, and its sides, covered with oaks, beeches, and other deciduous trees, are remarkable for beautiful scenery. The hills flanking its range, and beyond its strict limits, are called the *Vor-harz*. The geological composition of the Harz is granite, overlaid by gneiss, wacke, and claystone, in which the mineral wealth is wholly found. The *Vor-harz* is composed of the flötz, or old red-sandstone formation. The mineral products of the Harz are considerable; and it is said to furnish annually 30,000 quintals of lead, 1,700 quintals of copper, 85 quintals of silver, and a very large quantity of iron. (See *HANOVER*.) These returns appear, however, to be quite insignificant, if we may rely on the accounts given of the capabilities of the Harz. (*Bruguiere*; *Convers. Lex.*)

HASTLEMERE, a bor., market town, and chapelry of England, par. Chiddingfold, in the S.W. angle of So. Surrey, hund. Godalming, 40 m. S.W. London, and 12 m. N. Chichester. Pop. in 1831, 848, being a decrease of 43 since 1821. The town, only partly paved, and not lighted, stands on the side of a steep hill, and consists of a wide main street, crossed by two others, at the intersection of which is an ancient-looking town-hall. The houses are generally old and ill built, interspersed here and there with handsome residences. The church is ancient, with a low square tower: the Independents have a chapel; and there is a good national school. This place once possessed rather extensive manufactures of silk and crape; but these have disappeared: but it has still some large paper-mills about it, distant of little importance, has greatly diminished since the alteration of the London and Portsmouth road, which withdrew from it the traffic incidental to a great thoroughfare. Markets (ill provided and thinly attended) on Tuesdays; fairs for cattle, May 13. and Sept. 26. This small and unimportant town sent 2 mems. to the H. of C. from the 27th of Elizabeth down to the passing of the Reform Act, by which it was disfranchised. The electors were the burgage-holders; but it was, in fact, a mere nomination bor. of the Earl of Londesborough, the chief proprietor.

HASTLINGDEN, a market-town and chapelry of England, par. Witley, co. Lancast., hund. Blackburn, 160 m. N.N.W. London, and 7 m. S.E. Blackburn. Area of chap. 4,490 acres; pop., in 1831, 7,776. The town is pleasantly situated on the slope and at the foot of a hill. Most part of the houses are of stone; and it has the appearance of industry and prosperity. The church is modern, with an old tower. The dissenters have several places of worship, and in the Sunday schools are taught about 1,700 children. A free school, having a scanty endowment for 10 children, furnishes instruction to about 50. The increase of the town (which in 1831 had doubled itself since 1801) is attributable to the introduction of the cotton manufacture, which now employs the bulk of the working classes almost to the exclusion of the woollen

manufacture, which a few years ago was the staple of the town. The mills, &c. of Hastings are not distinguished in the returns of Whalley par.; but about 4,000 people of both sexes are said to be employed in manufacturing industry. Haslingden is the chief town of a poor law union, comprising 11 parishes. The surrounding country abounds in good building stone, and slate is quarried about 1 m. S. of the town.

HASSELT, a town of Belgium, prov. Limburg, cap. arrond. on the Demer, 14½ m. W.N.W. Maastricht. Pop., with commune (1837), 7,316. It is well built, and was surrounded with walls in 1282. It is the residence of the chief courts and civil authorities for the Belgian div. of the prov., and has several churches and hospitals, a college, prison, numerous distilleries, a large salt refinery, with other manufacturing establishments, and a considerable trade in spirits, tobacco, and madder, and two weekly markets. (*Vandermaelen, Prov. Limbourg, &c.*)

HASTINGS, a cinque port, parl. bor., and town of England, co. Sussex, rape same name, 54 m. S.S.E. London, and 32 m. E. Brighton; lat. 50° 59' N., and long. 0° 37' E. Pop. of town and port, in 1831, 10,097. It is pleasantly situated in a vale, surrounded on every side, except towards the sea, by hills and cliffs, the latter of which about E. of the town, close on the shore, those on the W. sloping more towards the interior; and it owes chiefly to its mild climate, consequent on this sheltered position, its high rank among the watering-places of the S. coast of England. Less than a century ago, it consisted of two chief streets, lined with ancient-looking houses; but within the present century many handsome streets and squares have been built, for the accommodation of visitors, and the appearance of the beach has been much improved by the removal of some old tenements which obstructed the sea-view. The two par. churches are ancient structures, but an elegant new church stands in Pelham Crescent, erected at the expense of the Earl of Chichester: there are also places of worship for Wesleyan Methodists, Independents, and other dissenters. There is a handsome town-hall. A grammar-school, founded in 1619, is attended by upwards of 100 boys; and there is a free school for 70 boys and 30 girls, with an endowment for apprenticing them: the various Sunday schools furnish instruction to about 900 children. The chief public buildings are the town-hall and custom-house: there are also extensive baths, well-assorted libraries, a handsome assembly-room, a theatre, a literary institution, and a savings' bank. Races were established in 1827. The suburbs are very beautiful, furnishing delightful drives and walks; and at the distance of 1¼ m. W. is the village of St. Leonard's, built according to the plans of Mr. D. Burton, and comprising a fine church, a large market-place, and many handsome houses and villas, occupied during the season by people of property and fashion. The trade of Hastings seems, from the charters, to have been once very extensive; and its port or stade was anciently protected by a pier destroyed by a storm in the reign of Elizabeth, and not rebuilt. Considerable quantities of fish are taken, and sent to the London market; a good deal of boat-building is also carried on, and lime is extensively produced in the neighbourhood. The mun. gov. of the town, which was vested in a mayor and 12 other Jurats, and regulated by the gov. charter of the cinque ports (20 Charles II.), and by one peculiar to itself (30 Eliz.), is now, under the Mun. Reform Act, committed to a mayor, 5 other aldermen, and 18 councillors, the town being divided into three wards. Petty and quarter sessions are held here, at the latter of which the recorder presides. Hastings has sent 2 mems. to the H. of C. since the 43d of Edward III., the franchise till the Reform Act, having been vested in all resident freemen (made so by birth or election) at the receiving of the arms: the number of electors being small, it had for many years been a mere nomination bor., in the patronage of the gov. for the time being. The present parl. bor. comprises the town and port, the liberty of the Sluice, and a detached part of the par. of St. Leonard's. Reg. electors, in 1838-39, 953.

Hastings is a place of high antiquity, having already, in the time of Athelstan, attained such importance as to be made the residence of a mint-master. On the edge of the W. cliff are the walls of an ancient castle, apparently of great strength, and the traces of walls indicate the town to have been fortified: on a hill E. are banks and trenches, supposed to have been constructed by William the Norman during his contest with Harold II., which terminated the Saxon dynasty. Its subsequent history is closely connected with that of the cinque ports, among which it ranked first. These trading towns, which were selected from their proximity to France, and early superiority in navigation, to assist in protecting the realm against invasion, were vested with chartered privileges from a very early period. The ports are, Hastings, Romney, Hythe, Dover, Sandwich, Wichelesca, and Rye: Deal was afterwards incorporated, and made subject in some particulars to Sandwich. In early times they furnished among them nearly all the shipping required

by the state, and even after the formation of a national navy, were compelled to assist it with their vessels. In the time of Edward I. they were required to provide, fully equipped, at their own cost, 37 ships, 21 of which were furnished by Hastings. In return for these services, which have long ceased to be rendered, except formally at coronations, these corporate towns, together with 23 others subordinate to them, enjoyed the privilege of exemption from service on county juries and in the militia, and the power of criminal and civil jurisdiction, even in capital cases, in courts peculiar, held under the authority of the lord warden. These exclusive privileges were suffered to continue, much to the injury of the community at large, and even of the towns themselves, till the Parl. and Mun. Reform Acts reduced them, with the reservation of the sessions-court and the exemption from serving on county juries, to the level of other towns possessing a really equal importance. (*Dallaway's Sussex; Parl. Rep. &c.*.)

HATFIELD, a town and par. of England, co. Hertford, hund. Broadwater. Area of par. 12,700 acres; pop. of do., in 1831, 2,593. The town is situated near the sea, 18 m. N.N.W. London, and 7 m. E. St. Albans. This place was granted in the 10th century to the Abbey of Ely; and on the conversion of the latter into a bishopric, the manor-house became a palace of the bishops, whence it has been called Bishops Hatfield. Queen Elizabeth, who had resided in the bishop's palace for some time previously to her accession to the throne, and was very much attached to the place, prevailed on the bishop of Ely to alienate it to the crown, in exchange for other property. In the succeeding reign, James I. exchanged the manor of Hatfield with his minister, Robert Cecil, Earl of Salisbury, for the manor and park of Theobalds. Its new master erected the present magnificent quadrangular mansion, one of the finest specimens of the baronial buildings of that age. A few years since it was materially injured by fire; but it has been restored, with great taste, quite in the old style. The town is small, and unimportant; it has a handsome church, with an embattled tower, and a burial-place of the Salisbury family. (*Chambers's Hertfordshire.*)

HAVANNAH, or **HAVANA** (Span. *Laabana*, "the harbour"), a large and flourishing marit. and commercial city, the cap. of the isl. of Cuba, and, perhaps, next to New York, the greatest emporium in the W. hemisphere. It stands on the N.W. coast of the island, and on the W. side of one of the finest harbours in the world: lat. 23° 8' 15" N., long. 82° 22' 45" W. The pop. of the city and suburbs, at the undermentioned periods, was ascertained to be as follows:—

Population.	1791.	1810.	1827.
Whites - - -	23,737	41,227	46,621
Free coloured - -	9,751	8,415	9,751
Slave coloured - -	10,849	2,297	1,010
Black - - -	-	26,451	22,630
Total - - -	44,337	96,304	94,025

To the pop. in 1827 must be added the pop. of the hospitals and prisons, the garrison, and strangers, making the whole about 112,000; and the total pop. is now probably not far short of, if it do not exceed, 125,000. (*Humboldt's Essai Politique, &c.; Turnbull's Cuba*, p. 305.)

From its position, which commands both inlets to the Gulf of Mexico, its great strength, and excellent harbour, the Havannah is, in a political point of view, by far the most important marit. station in the W. Indies. For a long period it engrossed almost the whole foreign trade of Cuba; but since the relaxation of the old colonial system, various ports (such, for instance, as that of Matanzas), that were hardly known 30 years ago, have become places of great commercial importance. The rapid extension of the commerce of the Havannah is, therefore, entirely to be ascribed to the freedom it now enjoys, and to the great increase of wealth and pop. in the city, and generally throughout the island. The port of Havannah is the finest in the W. Indies, and one of the best anywhere to be met with. The entrance is narrow, but the water is deep, without bar or obstruction of any sort, and within, it expands into a magnificent bay, capable of accommodating 1,000 large ships; vessels of the greatest draught of water coming close to the quays. The city lies along the entrance to and on the W. side of the bay; the suburb Regia is on the opposite side. The Morro and Punta castles, the former on the E. and the latter on the W. shore of the entrance of the harbour, are strongly fortified, as is the entire city; the citadel is also a fortress of great strength, and fortifications have been erected on such of the neighbouring heights as command the city or port. The city proper, which stands upon level ground, is about 2,100 yds. in length by 1,200 broad, and, even in 1810, contained less than half the total pop. It is separated on the W. by a ditch and glacis from its suburbs of Salud, Guadalupe, Jesus-Maria, Cerro, and Horcon. Within the walls, the streets are narrow,

crooked, and mostly unpaved; but in the suburbs, particularly Salud, they are wider and better laid out. The Havannah was formerly very much exposed, in the autumn, to the ravages of the yellow fever, owing partly to the filth of the city, the want of common sewers, and the contiguity of marshes; but of late years, the cleanliness and police of all parts of the town have been very materially improved, and fever is much less prevalent and fatal. The houses, within the walls, are all of stone; without, they are of various materials. The public edifices, such as the cathedral, government house, admiralty, arsenal, general post-office, and royal tobacco factory, are less remarkable for beauty than solidity of construction. Besides the cathedral, which contains the ashes of Columbus, removed thither from St. Domingo in 1796, there are 9 par. churches, 6 others connected with hospitals and military orders, 3 chapels or hermitages, 11 convents, a university, 2 colleges, a botanic garden, anatomical museum and lecture-rooms, an academy of painting, a school of navigation, and above 70 ordinary schools for both sexes. The charitable institutions consist of the *Casa Real de Beneficencia*, a penitentiary or magdalen asylum, a foundling asylum, and 7 hospitals, one of which comprises a lunatic asylum. The *Casa Real* also has within its walls two other lunatic asylums, with about 180 patients, an hospital for the aged and infirm, boys' and girls' schools, &c. The revenues of this institution, derived from landed and household property, donations, subscriptions, government grants, taxes on the flour imported at the Havannah and Matanzas, on public billiard tables, landing-places, a poll tax, and various other sources, amount to from 55,000 to 60,000 dollars a year, the whole of which sum is annually expended on objects of the charity. There are 3 theatres, an amphitheatre for bull-fights, and several handsome public promenades. The arsenal and dockyard are at the S. extremity of the city. In the latter, 49 ships of the line, 22 frigates, 7 packet ships, and many war brigs and schooners have been built. The saw-mills there are turned by water from an aqueduct, which also supplies the shipping in the port.

At the village of Casa Blanca, on the opposite side of the harbour, there are also some wharfs and shipyards, at which vessels of all classes may be laid up, fitted out, or repaired. This village is notorious as the resort of the slavers frequenting the Havannah, at which port a considerable number of the slaves brought into Cuba are landed. For accounts of the principal articles of import and export at the Havannah, the amount of duties levied on Spanish and foreign trading vessels, &c., see *Cuba*. The following table shows the quantities of sugar and coffee exported from the Havannah in 1838 and 39, specifying the countries to which these staples were principally sent:—

	Sugar. Boxes of 400 lbs.		Coffee. Arrobas.	
	1838.	1839.	1838.	1839.
United States	78,554	65,894	669,460	697,491
Great Britain	13,051	7,191	12,727	5,229
Cowes, &c. - -	74,922	74,719	33,727	15,816
Batavia - - -	30,877	26,120	16,160	406
Hamburg and Bremen	53,159	49,463	74,665	162,614
Holland - - -	12,481	89,326	1,650	13,148
Belgium - - -	15,947	9,887	2,394	9,782
France - - -	8,426	10,939	88,482	921,580
Spain - - -	63,484	69,989	17,400	30,526
Italy - - -	7,392	9,240	24,080	45,080
Other ports - -	8,563	3,706	1,604	9,922
Total - - -	368,356	396,498	916,837	1,204,096

The quintal of 4 arrobas contains 104 lbs. English; the arroba of wine or spirits is nearly 4 l. English gallons; the fanega is nearly 3 bushels; and the vara = 925 English yard: the dollar is worth about 4s. 6d. The market of the city are well furnished; in the year 1819, the consumption of meat, maize, manioc, vegetables, brandy, milk, eggs, forage, and anns amounted to 4,480,000 pounds, and provisions were brought daily from the country by 2,000 beasts of burden. A railway connecting the Havannah with Guines, a town 45 m. inland, was completed in 1839.

The Havannah is an episcopal see, the seat of the provincial government, and the residence of all the colonial authorities, except the judges of the supreme court of justice, which sits at Puerto Principe. The principal nations of Europe and America have consuls resident at this city. It has an extensive manufacture of cigars, for which it is widely celebrated; its other manufactures, of coarse woollens, straw hats, &c., are comparatively unimportant.

This city was founded in 1511, by Diego Velazquez; it was taken by a French pirate in 1663; afterwards by the English, French, and buccaners; and again by the English in 1762, by whom it was restored to Spain at the peace of 1763. (*Humboldt's Essai Politique sur l'Isle de Cuba; Turnbull's Cuba; Parl. Reports.*)

HAVERFORD-WEST (called by the Welsh *Haverford*), a par. bor., market-town, river-port, and co. of

itself in S. Wales, locally in the co. Pembroke, of which it is the cap., on the Cleddy, near where it falls into a creek stretching from the N. side of Milford Haven; 205 m. W. by N. London, and 38 m. W. by S. Caermarthen. The co. of the town, which extends over a considerable district, had, in 1891, a pop. of 2,915; but in consequence of additions made by the Boundary Act, the pop. of the present par. bor. amounted, in 1831, to about 4,500. This town—"is disposed in a very picturesque manner on the sides and at the bottom of very steep hills: the river Cleddy passes through its E. part, terminating in the creek. Its position gives it an irregular appearance; and the narrowness of the streets and want of proper pitching and paving, deprive it of an air of respectability which the number of good shops and houses would otherwise secure it." (*Bound. and M. Bound. Rep.*) It has lately been paved and lighted with gas. High Street and Market Street, however, notwithstanding the improvements in paving, are still dangerously steep. The handsomest of the churches is St. Mary's, a cathedral-like structure of pointed architecture, surmounted by a large square tower. St. Martin's is an extensive and lofty structure, apparently an appendage to the castle, and has a tower and spire. Outside the town, at the top of the hill, is St. Thomas's, said to have been built in 1226; and there is a low turreted church at Prendergast. There are several chapels for Methodists, Presbyterians, Baptists, and the Society of Friends. A charity school, for clothing and educating 24 boys and 12 girls, was founded in 1684; and a free grammar-school was established in 1614, and endowed with lands (now let for 90*l.* yearly), for the gratuitous education of the sons of poor burgesses. The town-hall is a respectable building, but placed so as to obstruct the view of St. Mary's church. A market-house, built by the corporation, was opened in 1825. A good and well-conducted modern gaol stands on the green, near St. Thomas's church. Overhanging the town is the ruined keep of an old castle; and within the precincts of an old priory of Black Canons, some ruins of which are yet standing, a dockyard and quays have been constructed for the convenience of the shipping.

"Haverford-west is principally occupied by shopkeepers, mechanics, and persons of moderate independent fortunes, for whom the cheapness of the place is an attraction. Provisions are cheap; house-rent is, however, not very low, as compared with this part of Wales; perhaps it would be more accurate to state that the houses of gentlemen here are on a very respectable scale; so that though houses are found to have large rents, they are not, properly speaking, dear. Workmen's wages are low; those of good mechanics averaging from 1*l.* to 2*l.* weekly. The lower orders use culm or coal mixed with clay for firing; and this is brought from a distance of about 3 m. A couple of the better sort being brought by water from Newport and Liverpool. Vessels of 100 tons can come up to the town at spring tides; but at neaps, vessels much exceeding 30 tons cannot come up. Hard coal, for making, is exported to the S. coast of England, and even to London; shop goods are brought by water; and about half a dozen timber-ships unlade here in the year. Butter and oats are exported; but the most important native commodity is the cattle, a great quantity of which is sold for the English market. The custom-house is subordinate to that at Milford Haven. On the whole, the place is certainly increasing and improving." (*Parl. Bound. Rep.*) A large paper-mill is the only manufactory of importance within the town, the traffic of which has much decreased since the Irish steam-packets have run from Bristol instead of Milford Haven.

Haverford-west was first chartered in the reign of Richard II.; but its governing charter, down to the passing of the Municipal Reform Act in 1835, was that granted in 7 James I. The bor. is now governed by a mayor, 3 other aldermen, and 12 councillors: corporation revenue in 1838, 554*l.* Haverford-west has sent 1 mem. to the H. of C. since the 17th of Henry VII. Previously to the Reform Act, the right of voting was vested in the inhab. of the town and co. paying scot and lot, and in the burgesses, who became so by birth, servitude, or election. The Boundary Act enlarged the limits of the par. bor., by adding to the old bor., or town and co. of Haverford-west, portions of the pars. of Prendergast and Ugmaston: the towns of Fishguard and Narberth were then also made contributory boroughs. Registered electors in the three boroughs, in 1838-39, 718. The assizes and quarter and petty sessions are held here. Markets on Tuesday and Saturday; fairs for horses and live stock, May 12, June 13, July 18, Sept. 23, Oct. 18. This town was anciently the cap. of the Flemish possessions in Pembrokeshire. Its castle was erected by Gilbert de Clare, first Earl of Pembroke, in the 14th century.

HAVRE (L'E.) (formerly *Havre-de-Grace*), a fortified town, and the principal commercial port on the W. coast of France, d^ép. Seine-Inférieure, cap. arrond. on the N. bank of the estuary of the Seine, at its mouth in the English Channel, 42 m. W. Rouen, and 109 m. W.N.W. Paris. Lat. 49° 20' 14" N., long. 0° 6' 38" W. Pop.

(1836) 25,618, to which number may be added 5,000 more for the pop. of the shipping constantly in the port. It is built on a low alluvial tract of ground formerly covered by the sea, and is divided into 2 unequal parts by its outer port and basins, which stretch into the town and insulate the quarter of St. Francis. A noble main street, the *Rue de Paris*, wide, clean, and lined with good houses and numerous shops, completely traverses the town S. to N., from the *Place de la Bourse*, on one of the quays, to the Ingouville gate: this is the chief seat of commercial activity; the other streets present nothing remarkable. There are 9 quays, which, with the High Street, form the favourite promenades. The fortifications, begun by Louis XII., continued by many succeeding sovereigns, and perfected by Napoleon, are about 3½ m. in circuit, and consist of bastioned ramparts surrounded by trenches. The tower of Francis I., a heavy round edifice of freestone, built by that monarch, nearly 70 ft. in height, and 55 in diameter, guards the entrance to the harbour on one side, and a small battery, mounting 6 pieces of cannon, on the other. The citadel, constructed by Richelieu in 1564, comprises the barracks, military arsenal, residence of the governor, &c. Havre has few other public buildings worth notice; the chief are—the church of Notre Dame, a singular edifice of the 16th century, the marine arsenal, new theatre, commenced 1817, exchange, custom-house, *entrepôt-général*, royal tobacco-manufactory, and a public library, with 15,000 vols. It has numerous public fountains, and is well supplied with water, conveyed by pipes from the vicinity.

The port, which is the best and most accessible on the coast, consists of 3 basins separated from each other, and from the outer port, by 4 locks, and capable of accommodating about 450 ships. A large body of water being retained by a sluice, and discharged at ebb tide, clears the entrance of the harbour, and prevents accumulations of silt. 2 lighthouses, 50 feet high, 325 feet apart, and exhibiting powerful fixed lights, stand on Cape de la Hève, a promontory about 2½ m. N.N.W. Havre, and 300 feet above the level of the sea; and there is also a brilliant harbour-light at the entrance of the port, on the extremity of the western jetty. Havre has 2 roadsteads; the great, or outer, is about a league from the port, and the little, or inner roadstead, about half a league. They are separated by the sand-bank called *l'Éclat*, between which, and the bank called *Le Haus de la Rade*, is the W. passage to the port. In the great road there are from 6 to 7½ fathoms water at ebb; and in the little, from 3 to 3½. Large ships always lie in the former. The rise of the tide is from 22 to 27 feet; and by taking advantage of it the largest class of merchantmen enter the port. The water in the harbour does not begin perceptibly to subside till about 3 hours after high water—a peculiarity ascribed to the current down the Seine, across the entrance to the harbour, being sufficiently powerful to dam up for a while the water in the latter. Large fleets taking advantage of this circumstance, are able to leave the port in a single tide, and get to sea, even though the wind should be unfavourable. (*Annuaire du Commerce Marit.; Coulier sur les Phares*.)

It was a saying of Napoleon, that "*Paris, Rouen, Le Havre, ne forment qu'une seule ville, dont la Seine est la grande rue*." Havre being, in fact, the sea-port of Paris, most of the colonial and other foreign products destined for its consumption are imported thither. Nearly double the quantity of goods, estimated by weight, is imported annually at Marseilles; but the total value of the imports at Havre amounts very nearly to that of those at the former port. The chief imports are cotton, sugar, coffee, rice, indigo, tobacco, hides, dyewoods, spices, drugs, timber, iron, tin, dried fish, &c.: grain and flour are sometimes imported and sometimes exported. The chief exports are silk, woollen and cotton stuffs, lace, gloves, trinkets, perfumery, Burgundy, Champagne, and other wines, brandy, glass, furniture, books, &c. The value of the imported goods in 1836 (including the sea warehouse at the end of 1835) amounted to 194,824,874 francs. The following is a

TABLE of the principal Kinds of Merchandise imported into Havre in 1836, and their Proportion to the Imports of France generally, in the same year:—

Articles.	Imported at Havre (1836).	Imported into France (1836).	Proportion of 1st to 2d.
Cotton	<i>Kilogrammes.</i> 42,165,972	126,191,100	0-70
Sugar	31,149,529	86,300,468	0-56
Coffee	8,194,945	20,619,287	0-38
Rice	3,295,891	7,429,784	0-44
Tobacco	3,283,792	6,591,701	0-48
Potash	2,590,549	5,015,214	0-50
Indigo	655,030	1,399,583	0-50
Wood for cabinet-work	3,960,000	6,212,000	0-58
Dye-woods	5,656,864	12,164,172	0-46
General imports	175,343,000	746,436,000	0-23
Value of do.	191,824,000 fr.	611,535,000 fr.	0-30

It thus appears that Havre received 7-10ths of the cotton imported into France in 1836, more than half the tobacco, and wood for cabinet work, half the potash and fuldigo, more than 3-5ths of the rice and dye-woods, and more than a third part of the sugar and coffee. As re-

spects cotton, Havre is to France what Liverpool is to England. We subjoin a table, exhibiting the quantities of some of the principal articles imported into Havre during each of the seven years ending 1837:—

Articles.	Imported.						
	1831.	1832.	1833.	1834.	1835.	1836.	1837.
Cotton { U. S. of America (bales) - - -	124,116	165,864	181,900	184,027	198,055	-	-
Brazil - - - - -	14,008	15,098	22,410	14,238	18,943	-	-
Other sorts - - - - -	2,579	2,438	6,283	3,131	8,511	-	-

Hides (No.) - - - - -	124,900	135,250	145,094	205,520	180,240	-	-

Most of the goods imported at Havre are destined for the internal consumption of France. The coasting trade has increased very largely of late years, as is proved by the great increase of French wines, soaps, and other produce imported at Paris from Havre, instead of being sent to the cap. by land. The coasting vessels transfer their cargoes to large barges, called *chalands*, which are towed by steam as far as Rouen, and by horses for the rest of the way to Paris. Independent of the *cabotage*, or coasting trade, there entered the port, in 1839, from foreign parts, 4788 sailing vessels, with cargoes of the total burden of 191,339 tons, of which 429 vessels, of the total burden of 106,392 tons, were French. Including native and foreign sailing vessels in ballast, and coasting vessels, the entries in 1839 were 4,384, total burden 580,993 tons. The entries of steamers during the same year were 568, total burden 101,561 tons. The latter ply between Havre and London, and the principal ports of Great Britain, Holland, Lübben, Hamburg, Elsinour, Copenhagen, Petersburg, &c.; and *lines* of sailing packets are established between it and New York, Bahia, Vera Cruz, New Orleans, &c.: some of the steamers ascend the Seine to Paris. The entrances to the basins are, however, too narrow to admit of the passage of large steamers, which are obliged to remain in the outer port, imperfectly sheltered from high winds. In fact, the port of Havre is at present inadequate to the growing importance of its trade; and in the financial estimates (*projet de loi sur les ports*) presented to the chambers in 1839, the French government demanded 6 millions of francs for its augmentation and improvement.

There belonged to Havre on the 31st Dec., 1838, 436 vessels, of the aggregate burden of 80,000 tons. During the same year 48 ships of from 400 to 600 tons each, manned by 1,500 prime seamen, engaged in the whale-fishery, belonged to this port; but this extension of the trade is principally to be ascribed to the encouragement given by the law of 1829: the ships, being in fact, fitted out quite as much in the view of catching the bounty as of catching whales. The customs' duties at Havre produced, in 1837, 18,123,993 fr.; in 1833 they amounted to 24,873,126 fr.; the reduction having been occasioned by the formation of warehousing establishments at Paris, and other places, for the reception of goods that had previously been warehoused here.

The town has manufactures of chemical products, furniture for the colonies, earthenware, starch, oil, and tobacco, besides good building docks, rope-walks, breweries, &c.; and many females are occupied with making lace.

On a height immediately N. of Havre is its well built and pleasant suburb of Ingouville. In that village is the *Hospice d'Havre*, founded by Henry II. in 1554, and removed to Ingouville in 1609, at which establishment it is estimated that about 120 sick persons, and upwards of 500 aged, orphan, or infirm, are annually provided for. (*Hugo, art. Seine Inférieure; Encyc. des Gens du Monde; Official Tables; Commercial Dict.*)

HAWICK, a bor. of barony, and eminent manufacturing town of Scotland, co. Roxburgh, on level ground, on the banks of the Teviot, 45 m. S.E. Edinburgh, and 48 m. N. by R. Carlisle. A small mountain stream, called the Slitterig, falls into the Teviot, towards the extremity of the town. The country round is mountainous and pastoral, except the narrow valley through which the two rivers flow. The town was originally confined to the bank of the Teviot, and to the parish of its own name, but its boundaries now extend to the opposite side of the river, in the parish of Wilton. Pop., in 1801, 2,145; in 1838, 5,998.

Hawick consists chiefly of a single street, $\frac{1}{2}$ m. in length, which forms the line of the public road; but there are several suburban streets, of which the largest and the most elegant is the Crescent, built on the right bank

of the river. The town, the houses of which are of stone, and slated, has a substantial thriving appearance; and the transparent waters of the Teviot and Slitterig flowing over a pebbly bed, with the mountains which so closely environ it, give it a high degree of picturesque beauty. The streets are paved, and lighted with gas. Being a border town, and consequently of old exposed to attacks from the English, the houses were anciently built with stone walls, and vaulted below, without any door to the street, but having an archway, giving access to a court-yard behind, from which alone entrance to the house was obtained. Of these structures a few specimens yet remain. The present head inn is called "The Tower," because it was originally built as a fortress, having been the residence of the feudal superior of the burgh. There are two bridges over the Teviot; and two over the Slitterig, one of the latter being supposed to be of Roman origin. The only public buildings are the subscription rooms (used for public meetings, &c.), the town-house, the parish church, with a small square spire, and three dissenting meeting-houses. Of these latter, two belong to the Associate Synod, and one to the Relief. The Quakers, though a small body, have a place of worship. There is also a small congregation of Independents. Between a third and a half of the pop. are Dissenters. (*1834 Report of Church Commissioners, 1839.*) The means of education are most ample. In addition to the parochial school there are no fewer than 13 private seminaries, some of them exclusively for females; and the aggregate number of scholars is rather above 800, a greater number, as compared with the pop., than will perhaps be found in any other bor. in Scotland. This, too, is exclusive of children who attend Sunday schools. There are several subscription libraries in the town, the oldest of which, containing 3,500 vols., was established so far back as 1762. A Mechanics' Institution was founded in 1824. (*New Stat. Acc. of Scot. & Roxburgh, p. 412 & 414; Educational England; Scotland, Parl. Paper.*) There are two printing presses, and three reading rooms.

Notwithstanding its inland situation, its distance (50 m.) from any sea-port, its want of railways, canals, or navigable rivers, Hawick has attained to great eminence in manufactures. It has pretty large establishments for the manufacture of thongs, gloves, candles, machinery for tanning of leather, and other branches; but the woollen manufacture is that for which the town is chiefly distinguished, a department of industry which undoubtedly owes its origin to the command of water-power which the Teviot and Slitterig afford, and to the wool-growing district in the middle of which Hawick is situated. The manufacture of carpets was established in 1759; the *wool* (a species of tape) manufacture in 1763, and that of cloth in 1787. But those have very generally given way to the manufacture of stockings and under-clothing, introduced in 1771; and it was from Hawick that a knowledge of this branch of manufacture spread, and was introduced into Wooler, Selkirk, and other towns both in the N. of England and S. of Scotland. But comparatively trifling progress was made in the manufacture till the introduction of machinery, which took place about the beginning of this century, since which the business has been steadily advancing. Within the last few years great additions have been made to the mills previously established; while several new mills have been erected on a large scale. There are at present (1840) 11 extensive factories, of which one only is driven by steam, and the others by water. There are, besides, various buildings of considerable extent for the operation of stocking-frames. The following table, constructed from returns made by some of the leading manufacturers of Hawick, will give a tolerably correct idea of the state of the manufactures during 1839-50:—

Value of floating capital employed in manu- factures, (buildings and other articles of fixed capital excluded) - - - - -	101,861.
Amount of wages - - - - -	45,785.
Quantity of yarn manufactured, (exclusive of what is sold to manufacturers at a distance) -	854,462 lbs.

* The Teviot, which is itself a tributary of the Tweed into which it falls at Kelso, gives its name to the pastoral district (Teviotdale) through which it flows. The term Teviotdale is also applied to the county.

Consumption of wool	109,163 stones.
Quantity of soap consumed	109,432 lbs.
Number of stockings made	1,049,676 pairs.
Articles of under-clothing	12,552
Number of work-people	7,788
Number of stocking-frames	1,509
Number of weaving looms	226

This is exclusive of flannels, plaiding, blankets, shawls, tartans, druggets, and cloths of various descriptions, the aggregate value of which may amount to from 30,000*l.* to 40,000*l.* a year. The hosiery includes every species of texture, even the finest. The number of work-people given above does not include the females engaged in sewing stockings, these being employed not by the manufacturers but by the stocking-makers, nor the weavers and stocking-makers in the neighbouring towns and parishes, who work for the Hawick manufacturers. Besides, the number of persons employed in the factories, as returned by the Factory Inspectors, is not a third part of those to whom manufacturers give direct employment. The stocking-maker, for example, works on his own frame in his own house, and is paid by the piece, and so of others. The total amount of power employed, including one steam engine, is equal to 160 horse-power. Coal cannot be got nearer than 40 m. *viz.* either from Etals in Northumberland, Langholm in Dumfriesshire, or Dalkeith in Mid-Lothian. Yet, in the face of the formidable difficulties of the distance from sea and from coals, the woollen manufacture has been prosecuted in Hawick with a degree of activity, enterprise, and success quite peculiar, and highly honourable to the character of the manufacturers. They in most cases are their own salesmen; and no class of commercial men carry on business with greater liberality, activity, and perseverance. There are three branch banks in the bor.

Hawick has been a bor. of barony from an early date. But its present charter was granted by William Douglas, of Drumlanrig, in 1587, and confirmed by Queen Mary, in 1548. The charter is peculiarly liberal for the age in which it was granted, extending to all the burghesses, without distinction, the right of electing the municipal authorities. The senior magistrate has, since 1835, been a justice of the peace *ex officio*. The landed property of the burgh amounts to 1,000 acres, and the gross annual revenue to upwards of 470*l.* The feudal superiority of the bor. descended to the barons of Buccleuch till 1747, when, all hereditary jurisdictions being abolished by act of parliament, the Duke of Buccleuch received 400*l.* in compensation for the regality. From its situation near the English border, Hawick was exposed to that continual hostility and commotion which for centuries distinguished that portion of the empire. It was burnt down in 1416. It suffered severely in 1544, when the whole district of Teviotdale was laid waste by the English. To prevent its occupation by the troops of the Earl of Surrey, in 1570, the inhabitants themselves tore the thatch from the roofs of the houses, and set fire to it on the streets, by which, with the exception of the Black Tower, now the "Tower Inn," the whole town was completely consumed. The inhabs. of Hawick mustered strong in the battle of Flodden, and were there nearly extirpated; but the survivors succeeded in rescuing their standard, which is still carefully preserved.

The people of Hawick are still distinguished by the free spirit of their ancestors. "We doubt much if a community could be found elsewhere more jealous than they are of what they conceive to be their own rights; more keen and indefatigable in the working out of what they reckon to be their own interests; and more determined in asserting, at all hazards, what they deem to be essential to their own independence. Any thing like a spirit of vassalage to any man, or any class of men, how elevated soever in rank, is what they cannot brook; and any attempt, from whatever quarter, to interfere with their ancient or established privileges, is sure to be strongly and almost universally resisted. There are, moreover, few places where less attention is paid to the ordinary distinctions of rank, or where all classes are more disposed to associate together on the footing of equality." (*New St. Acc. of Scot. & Northburgh*, p. 388-89.) The truth is, they have always been a free people in the midst of a feudal and comparatively dependent population. Principles and worth, not mere rank, are valuable in their estimation. Since the passing of the Reform Act they vote with the county constituency; and, with few exceptions, their suffrages are given in favour of the liberal candidates. The greater portion of the population are descended from ancestors belonging to the burgh; and as there are thus many individuals of the same name (there being at present no fewer than six heads of families in the town of the name of Walter Wilson), soubriquets, or conventional designations, have prevailed among them from the earliest record. So late as the practice, that is the soubriquet, instead of the real name, was at a distant period, generally inserted in the parochial register of deaths. Even at present, so general is the practice, that many persons are better known by their fictitious name than by any other. The town has frequently suffered from inundations.

There is an artificial mound of earth situated at the W. extremity of the town, called "the Moat," used, in ancient times, for meetings both judicial and deliberative. Brankholm Castle, the ancient seat of the Scots of Buccleuch, and celebrated in *The Lay of the Last Minstrel*, is situated within 2 m. of the town. Several eminent persons have been born in or connected with Hawick. Gavin Douglas, afterwards bishop of Dunkeld, and the translator of Virgil's *Æneid*, was rector of Hawick in 1496; Dr. John Leyden, the celebrated poet and linguist, who died in Java in 1811, was born in the vicinity of the town; Dr. Thomas Somerville, minister of Jedburgh, and author of a *History of Queen Anne*, and other works, was born in the burgh; the Rev. Mr. Young, author of *Essays on Government*, was a dissenting clergyman here; and Mr. Robert Wilson, author of the *History of Hawick*, a native of the burgh, died here in 1837.

HAYE (LA), a small town of France, *dép.* Indre-et-Loire, cap. cant., on the Creuse, 30 m. S. Tours, worthy of notice only as the native place of Descazres, born here on the 31st of March, 1696. The first of this name who first saw the light, has been carefully preserved, and is the subject of an almost religious care and veneration.

HAYTI, or HAÏTI (Carib. *the mountainous country*), the original and now revived name of one of the W. India islands, being, next to Cuba, the largest of the Greater Antilles, and forming, inclusive of the adjacent islands of Tortuga, Gonave, &c., an independent state. Columbus gave it the name of *Hispaniola*, and it was frequently also called *St. Domingo*, from the city of that name on its E. coast. The French bestowed on it the deserved epithet of *la Reine des Antilles*. It lies between lat. 17° 40' and 19° 54' N., and long. 68° 24' and 74° 35' W.; having N. the Atlantic, E. the Moua Passage, separating it from Porto Rico, from which it is 76 m. distant, S. the Caribbean Sea, and W. the Windward Passage, which lies between it and Cuba and Jamaica, its N.W. point being 48 m. E. of the former, and its S.W. 112 m. E. of the latter. Its shape is somewhat triangular, the apex directed eastward; but it has several considerable peninsulas and promontories, which render its outline very irregular. Greatest length, W. to E., about 400 m.; its breadth varies from 40 m., near its E. extremity, to 155 m., about its centr. Area, according to M. Lindenau (*Humboldt, Polit. Essay*), 2,450 sq. marine leagues, or nearly 29,500 sq. m. Eng. Pop. estimated at from 600,000 to 700,000, about a tenth part only being white or coloured.

Physical Geography.—The surface of Hayti is, as its name implies, generally mountainous; but there are some extensive plains, especially in the E. The mountain system is complicated, and it is difficult to give a clear idea of it without the aid of a map. A great mountain knot, the Cibao, occupies the centre of the country, from which two parallel chains, running E. and W., extend through the island in its entire length. The loftiest summits of the Cibao are considerably more than 6,000 ft. in height. In the S.W. is an additional mountain chain, which stretches W. to the extremity of the long and narrow peninsula terminating in "Cape Tiburon." This peninsula, and the N.W. promontory of the island is the spacious bay of Gonave, including the island of the same name, and having at its head Port République (or Port-au-Prince). Tortuga is opposite the N.W. promontory. The shores of Hayti are in general bold, except on the E., where low and swampy lands prevail. They are almost every where surrounded by small uninhabited islands and dangerous reefs, but they have, notwithstanding, many excellent harbours, especially along the N. and W. coasts. The largest plain, called by the Spaniards *Las Plaines de l'Est*, extends along the coast for 80 m., with a breadth varying from 20 to 25 m. It is said to be well adapted to the culture of most tropical products, but has always consisted chiefly of wide savannahs, used for pasture lands. N. of it, enclosed between two mountain ranges, is the more productive plain of Vega Reale, little inferior in size to the foregoing. In the W. half of the island are the large plains of Artibonite and the Cul-de-Sac. The last named, E. of Port-au-Prince, is from 30 to 40 m. long, by about 9 broad, and was formerly one entire sugar-garden, though now almost wholly waste. There are several plains of less extent. Hayti is in most parts profusely watered; it has numerous rivers, the largest being the Yaque, Yuna, Nève, and Artibonite, which disembogue on the N., E., S., and W. coasts. These are navigable for a great part of their course; they are generally deep, and two or three of them are, near their mouths, as wide as the Thames at Vauxhall. Three lakes of considerable size exist at no great distance from the S. coast of Henriquillo; the largest is about 50 m. in circuit, and has salt water, while the adjacent lake of Axney is fresh.

The climate of the low lands is very unhealthy to Europeans; and Mackenzie says that "the yellow fever would effectually secure the island, in case of external

attack, if the policy of abandoning the coasts and destroying the towns were acted on." (*Notes on Haïti*, vol. II.) The excessive heats of the plains, &c. are, however, tempered by fresh sea breezes at night. The temperature, of course, decreases with the elevation, and in the mountains the cold is often piercing. The year, as elsewhere between the tropics, is divided between the wet and dry seasons. The change of the seasons is accompanied by stormy weather, but hurricanes are not so frequent as in most of the other Antilles, nor are earthquakes common, though in 1770 a convulsion of that kind destroyed Port-au-Prince.

Little is known of the geology; a limestone somewhat analogous to that of Cuba, containing vestiges of marine shells, is a prevalent formation. The soil is almost universally a deep vegetable mould, the fertility of which is scarcely equalled. The mountains, even to their summits, are, according to Mackenzie, capable of cultivation. The greater part of the island is covered with dense forests of mahogany, ironwood, logwood, cedar, and other large and useful trees, or an impenetrable underwood. The plantain, potato, vanilla, manioc, &c. are indigenous; as is the palmetto or cabbage-tree. The latter is "truly the prop of the E. Haytian, who eats the upper portion of it, builds and covers his house with its various parts, and fashions his furniture out of its trunk." Of several kinds of quadrupeds found by the first European settlers, the *agouti* is the only one remaining. Parrots, and other birds of brilliant plumage, waterfowl, &c. are very abundant; the alligator, cayman, iguana, turtles, &c. abound in the larger rivers; several kinds of serpents are met with, and the *crustacea* and *testacea* afford a plentiful supply of food to the inhab. of the coasts. Hayti produces gold, silver, copper, tin, iron of good quality, rock-salt, &c. The principal copper-mine yields an ore containing a considerable admixture of gold, and the sands of many of the rivers contain a good deal of gold dust, small quantities of which are collected: the working of gold mines has, however, entirely ceased. The mines of China, which have long been unproductive, are said by Robertson to have yielded for many years a revenue of 460,000 *pesos* (nearly 100,000*l.*) annually; but it deserves to be remarked, that notwithstanding the excessive destruction of the original inhabs. in the working of these and other mines, the Spaniards derived so little advantage from them, that when Sir Francis Drake made a descent on the island in 1588, the inhabs. were so wretchedly poor as to be compelled to use *pieces of leather* as a substitute for money! (*Edwards*, i. 110., ed. 1819.)

History and Resources.—In order to understand the progressive changes which have taken place in the condition of Hayti and its inhabitants, it is necessary to premise a short sketch of their history. The island was discovered by Columbus, on the 5th of Dec. 1492, at which time it is said to have been divided into five states. Having taken possession of it, in the name of Spain, Columbus founded the town of La Isabella on the N. coast, and established in it, under his brother Diego, the first colony planted by Europeans in the New World. The city of St. Domingo, which subsequently gave its name to the entire island, was founded in 1498. The island is believed to have contained, at the

epoch of its discovery by the Spaniards, above 1,000,000 inhabs. of the Carribb tribe of Indians. But, incredible as it may appear, in consequence of their wholesale butchery by the Spaniards, and of the severe drudgery they were compelled to undergo in the mines, the natives were reduced to about 60,000 in the short space of 15 years! (*Robertson's America*, i. 158., ed. 1777.) The aboriginal inhabs. were soon, in fact, wholly destroyed; and their place was at first very inadequately supplied by Indians forcibly carried off from the Bahama Islands, and adventurers from Spain and other European countries, and in the following century by the importation of vast numbers of negroes from Africa. The Spaniards retained possession of the whole island till 1665, when the French obtained a footing on its W. coasts, and laid the foundations of that colony that afterwards became so flourishing. In 1691, Spain ceded to France half the island; and in 1776 the possessions of the latter were still further augmented. It was not, however, till 1722, when the monopoly of trading companies was put an end to, that the French part of the island began rapidly to advance in pop. and wealth. From 1776 to 1789 the colony had attained the acme of its prosperity; and its produce and commerce were then equal or superior to those of all the other W. India Islands. Unhappily, however, this prosperity was as brief as it was signal; and the ruin that has overwhelmed the colony may be said to be complete.

To attempt to give any intelligible sketch, how slight soever, of the events by which this destruction was brought about, and by which the blacks Hayti have emancipated themselves from the dominion of the whites, and founded an independent state, would far exceed our limits: At the epoch of the French revolution, the negroes in the French part of St. Domingo were estimated at from 480,000 to 500,000. That a good deal of dissatisfaction existed amongst them is certain; but there was no disposition to revolt, and the rash and injudicious proceedings of the mother country, the debates and proceedings of the colonial assembly, and the deep-rooted animosities of the whites and mulattoes, were the prominent causes of the revolution. The proscriptions, ruin, bloodshed, and atrocities by which it was accompanied and brought about, are, perhaps, hardly to be paralleled. In 1800, Hayti was proclaimed independent; and its independence was consolidated by the final expulsion of the French in 1803. This was effected by Dessalines, who erected the French or W. part of the island into an empire, of which he became emperor, with the title of James I. His despotism and cruelty having rendered him universally detested, Dessalines was slain in an insurrection in 1806, and Hayti was divided among several chieftains, the principal of whom were Christophe in the N.W., and Petion in the S.W. In 1811, the former made himself proclaimed king, under the title of Henry I.: Petion continued to act as president of a republic till his decease in 1818, when he was succeeded by Boyer. The latter, after the suicide of Christophe, in 1820, took possession of his dominions, and the Spanish portion of the island having, in 1821, voluntarily placed itself under his government, he became master of the whole of Hayti.

Previous to the revolution, the pop. and the extent and distribution of cultivated lands, &c. in the French division of the island were thus estimated (*Edwards's Hist. Survey*):—

Provinces.	Population, 1790.		Plantations, &c.					Chief Towns.
	Whites.	Blacks.	Sugar.	Coffee.	Cotton.	Indigo.	Various.	
Northern	11,906	164,656	288	2009	66	445	215	Cap François.
Western	12,361	192,361	357	874	46	1,862	34	Port-au-Prince.
Southern	6,637	76,812	118	214	234	765	119	Aux Cayes.
Total	30,894	434,429	765	3,117	789	3,160	677	

* Exclusive of European troops and seafaring people, of free people of colour amounting to about 24,000, and domestic slaves and negro mechanics in towns, perhaps 50,000.

The whole extent of land under cultivation in the three provs. was 763,923 *carreaux*, equal to 2,289,480 English acres, about two thirds of which were situated in the mountains. The French, who justly considered this their most valuable colony, cultivated its territory with the greatest care. Every plantation was laid out with the utmost neatness, and so arranged as to bring every portion of the soil into use in the proper order of succession. Artificial irrigation was effected on a large scale, and the remains of the aqueducts in the plain of Cayes are really magnificent. The growth of sugar engaged the largest share of attention; the immense fertility of the soil making the average produce about 2,712 lbs. an acre, or nearly two thirds more than the general yield of the land in caneis in Jamaica. (*Edwards*, p. 135.) The coffee plantations were also exceedingly productive, and those of cotton, indigo, and cocoa had begun to be prolific sources of wealth to individuals, and of revenue to the state. Besides these staples, large quantities of Indian corn, rice, pulse, and almost every description of vegetables required for the consumption of the inhabs. were grown. The live stock in the French colony consisted of about 40,000 horses,

50,000 mules, and 250,000 cattle and sheep. The Spaniards never paid much attention to the culture of their portion of the island. The example of the French, indeed, stimulated them to grow tobacco, sugar, cocon, and some of the other staple products of the Antilles; but their chief source of wealth consisted in the breed of cattle they reared on their extensive savannahs. With these they supplied their French neighbours, whose demands were large; besides which, they exported a good many to Jamaica and Cuba. Hides were also one of their chief articles of export, and, according to Edwards, many cattle were slaughtered for their hides only. The occasional cutting of mahogany, cedar, and other kinds of timber, dye-woods, &c., made up nearly all the rest of their resources. It is stated that the French purchased annually upwards of 25,000 head of horned cattle, and about 2,500 mules and horses; and that the Spaniards also transmitted upwards of half a million of dollars, in specie, during the year, for the purchase of goods, agricultural implements, and negroes. Large shipments of mahogany and dye-woods found their way to Spain and different parts of Europe, the U. States, and Jamaica,

and a considerable intercourse was kept up with Porto Rico and the Spanish main. Most of the trade of the Spanish colonists was, however, illicit, the facilities for smuggling being quite as great as the advantages derived from evading the heavy duties imposed on commerce.

The following is an estimate of the average exports from the French part of St. Domingo during each of the three years ending with 1789:—

Articles.	Quantities.	*Value in livres.
Clayed sugar - lbs.	56,545,914	41,089,549
Muscovado do. - "	86,548,829	24,619,931
Coffee - "	71,663,187	71,663,187
Cotton - "	6,694,838	12,297,716
Indigo - "	351,607	8,564,463
Molasses - hhds.	25,061	2,767,520
Rum - "	2,600	312,000
Raw hides - No.	6,500	62,000
Tanned ditto - "	7,500	118,500
Total value at ports of shipping	-	171,544,666 = £. 4,765,129

One of the first effects of the revolution which abolished the slavery of the blacks was an enormous decrease in the amount of agricultural produce. From 1794, the year in which the slaves were declared free by the National Convention of France, to 1796, the value of the exported produce had sunk to 8,600,720 livres, being only about 5 per cent. of what it had been in 1789; and seven years afterwards, the exports had become almost a desert, not only from the waste of civil war, but also from the influence of the black pop. The famous Toussaint L'Ouverture adopted coercive measures to restore agriculture; and it is, we believe, idle to suppose that any other will ever be effectual in such a country to impel the negro to labour. By an edict issued in 1800, Toussaint obliged every Haytian not a proprietor of land (with a few exceptions) to hire himself as an agricultural labourer to some proprietor, without the power subsequently to withdraw himself from his service. The labouring classes were thus again rendered slaves in fact, though not in appearance. The use of the whip was abolished; but, on the other hand, the sabre, musket, and bayonet, in the hands of a military police, were employed to keep the peasantry at work. This object was enforced with the most rigid severity; the hours of labour were to continue from sunrise to sunset, with a few intervals; and both the cultivator and proprietor were visited with heavy pains and penalties; the former if he refused to work, and the latter if he did not oblige the former to do so. By such means, with a labouring pop. not exceeding 250,000, according to Humboldt, the exports in the most productive year during the short sway of Toussaint were raised to the following amount:—

Sugar -	53,400,000 lbs.	Cocoa -	254,600 lbs.
Coffee -	34,370,000 -	Indigo -	37,600 -
Cotton -	4,050,000 -	Molasses -	9,128 hhds.

This compulsory system was followed both by Dessalines, who at one period raised the value of the exports to 53,191,800 livres, or to a third part what it was in 1789; and by Christophe, an able, though a brutal and sanguinary tyrant. Petion, on the contrary, abandoned the coercive plan; and, in consequence, while the N. W. part of the island had the appearance of industry and cultivation, the S. W. displayed little more than occasional spots of culture. Beyer, during the first few years of his rule, continued the lax system of his predecessor, and the total value of the exports of the *entire island* amounted, in 1825, to no more than 5,793,758 dollars (4s. 2d. each)! The state of agriculture at that period was most deplorable: every branch requiring systematic industry had fallen into decay; the sugar plantations had become almost annihilated; the plain of Cul-de-Sac, formerly an immense sugar-garden, had on it only forty plantations of any extent; little or no sugar was made, the juice being either used as syrup for domestic purposes, or distilled into tafia, the favourite liquor of the natives; coffee, in the W. part of the island, was grown only around Cayes, and in some small patches in the mountains; and in the former locality at least two thirds of what was raised was lost for

want of hands to gather the produce: all other products were obtained in small quantities only; maize, the only species of corn grown, was frequently scarce, and sometimes imported from the U. States, whence also a good many of the horses required were obtained. The following extracts from Mr. Mackenzie's report (1827-28), though referring more especially to one district, give a good idea of the general state of agriculture in Hayti:—

"According to Moreau St. Méry, in 1789, the plain of Cayes, one of the finest in the island, contained at that period 100 flourishing sugar plantations, which were calculated to yield annually from 120,000 to 150,000 casks of muscovado sugar, the weight of which is unfortunately not stated in pounds, so that the absolute amount cannot be given.

"At present, the whole of these 100 plantations are still partially planted in canes, of which, however, no care whatever is taken. About 75 of them have either water or cattle mills for grinding the cane, with boiling-houses; but generally of a most wretched construction, and in miserable condition. The boiling-houses in general are formed by a shed made against the old walls, which, during the revolution, it required too much labour to destroy. The canes produced on the remaining 25 plantations are transported to those that have mills, and one fourth of the syrup or molasses produced is allowed for the use of the mill. The whole of these estates are, more or less, in a dismembered condition, from the small grants made by the government to the military of from 5 to 30 carreaux, and from similar sales having been effected by many of the large proprietors. The parties purchasing are called 'concessionnaires' and generally plant small patches of cane, which they grind at the estate to which the land formerly belonged, or at some other neighbouring property. The land is never manured, and scarcely ever weeded, and only a part of each year's produce is converted into molasses. This arises principally from idleness, to which may be added the depredations of cattle, owing to bad fences, and the almost total impossibility of repairing sugar-works, from a want of workmen, and the bad faith of all parties concerned.

"About 1,000 hhds. of raw sugar of 1,000 lbs. each, may be considered the average quantity produced by those estates; but it fluctuates very much. Few of the plantations make more than from 3 to 4 hhds. of syrup per week, and that generally at distant periods; very few having the power, from want of manual labour, of grinding canes two or three weeks in succession. Nearly the whole of the molasses are purchased by the distillers (the proprietors being generally too poor to erect distilleries on their own plantations), and principally converted into tafia, an inferior spirit, 4,500 hhds. of which, with 600 hhds. of rum, of 60 gallons each, were made in 1826. The whole of those spirits are consumed either in the immediate neighbourhood, or sent into the interior, or coastwise to Port-au-Prince and other ports. None of them are exported for foreign use.

"The very little field labour effected is generally performed by elderly people, principally old Guinea negroes. No measures of the government can induce the young creoles to labour, or depart from their habitual idleness and vagrancy. The few young females that live in the plantations seldom assist in any labour whatever, but live in a constant state of idleness and debauchery. This is tolerated by the soldiery and military police, whose licentiousness is gratified by this means.

"The value of land is very small, varying from 24 to 100 dollars per carreau or 1-8125 acre. In some cases, 200 dollars have been given. Rent also varies. It is, however, rare that estates are farmed out in the neighbourhood of Cayes." Small properties of from 5 to 10 carreaux, with a few negro huts, are let at an annual rent of from 40 to 100 dollars. Larger ones of 100 or 200 carreaux, from 400 to 800 dollars per annum. Money is lent at 75 per cent. per annum." (*Parl. Report on Hayti*, published 1829.)

The following table, showing the amount of the external trade of Hayti at different periods, will tend to indicate the effects of the different measures of its successive rulers:—

TABLE of Exports from Hayti, during the Years 1789, 1801, and from 1818 to 1826, both inclusive. (From Mackenzie's Notes on Hayti, — Appendix.)

Year.	Clayed Sugar.	Muscovado Sugar.	Coffee.	Cotton.	Cocoa.	Indigo.	Molasses.	Dye-woods.	Tobacco.	Caster Oil.	Mahogany.	Cigars.	Gum Guaiacum.
Lbs.	Lbs.	Lbs.	Lbs.	Lbs.	Lbs.	Lbs.	Lbs.	Lbs.	Lbs.	Gallons.	Feet.	No.	Lbs.
1789	47,510,351	93,273,500	76,333,819	7,004,374	-	758,628	35,740	-	-	-	-	-	-

* This table comprises, with the exports from the E. portion of the island, those from Port-au-Prince and St. Domingo, since their annexation to the republic in 1822.

At length, however, Boyer adopted coercive measures, and in 1826 promulgated his *Code Rural*, which is as stringent as that of any of his predecessors. It enacts that every Haytian not employed in the civil or military service, in some manufacture, as a patented tradesman, or as a domestic servant, shall, under pain of imprisonment and hard labour, attach himself to some estate, and employ himself in agricultural labour. He cannot quit the country for the purpose of residing in any town or village, nor venture off the estate without a licence; he dare not desert from labour during the hours specified, nor take any recreation except at stated times; he is prohibited from keeping a shop, nor can he even send his children to school or to be apprenticed in a town, without especial permission. In return, the cultivator has a right to a fourth part of the produce of his labour, and the proprietor is bound to pay the expenses of his maintenance and other agricultural charges. However severe and little consistent with our ideas of freedom, we have no doubt that some such system is absolutely indispensable; but the misfortune is, that it acts only on the labourer, while it leaves the proprietor of a few acres, or of one, to indulge in idleness and dissipation, without let or hindrance. This inconsistency is aggravated by the circumstance of the government readily making grants of small patches of land (10 or 15 acres) to individuals who, in consequence, are emancipated from the onerous obligations of the *Code Rural*. This plan, as Mr. Franklin has observed, goes to "extend and perpetuate the evil and pernicious habits of the people. When a negro obtains a grant of a small tract of land, he cares little about the cultivation of it beyond the production of enough for his own immediate wants; and these wants are trifling. Two or three hours' labour in each week will suffice to answer all the purposes of the culture required to produce food enough for himself; the rest of his time is then allowed to dwindle away in the most puerile pleasures and inconsistencies. No object which moderate industry could procure would balance the insatiable desire for reposing under the shade of the guava, and for ablutions in the neighbouring stream; with these and a little food, all his wants are supplied. Such being the case, and known to be so by the government, it is enough to surprise one that they should parcel out their lands in this way; because, even under the *Code Rural*, the person holding it is no longer a labourer, but a proprietor, and is not, therefore, amenable to it. Had the government proceeded differently, and let the estates to farm as they were originally laid out, so many petty proprietors would not have existed, but would have remained amenable to the law for enforcing cultivation. From this unwise system, labourers are scarce in Hayti, and the few that are to be obtained are of the worst character—the negroes abandoned as not to have been considered worthy of inheriting a patch of land. Hayti abounds with these small proprietors; their patches of land, with their huts upon them, are generally situate in the mountains, or on the most elevated parts, on spots, as the poet has described, 'the most inaccessible by shepherds' trod.' They are therefore lost for the purposes of agriculture: their cultivation does not extend beyond vegetables for the markets in their vicinity; added to which, they furnish an occasional supply of pork, poultry, and wild pigeons.

The Haytian proprietor is not a planter practically, and he is ignorant of his theory. There is nothing regular in his system; it is an anomaly, a strange incongruous method of proceeding, having no tendency either to improve the soil or benefit himself. The sugar planter, in the first place, is so ignorant, that he knows not the virtue which his soil possesses, nor what it is capable of producing. He considers not whether one field be better adapted for the production of canes than another, but plants indiscriminately in bad or good soil, in heavy or light; in fact, he knows not whether it ought to be planted with canes or cotton, or if it would be wise to allow it to become common pastures. He is contented, and seems to be quite satisfied, if he can but obtain vegetation in any way, careless about the manner in which it is accomplished. To ascertain whether it can be improved by art or industry, is a matter about which he is unconcerned." (*Present State of Hayti*, pp. 344—346.)

We are without any authentic information as to the present state of agriculture; but if we estimate it by the best criterion, that of the exports, it would seem to be in the most depressed state. Sugar has all but entirely disappeared from the list of exports; and the exports of coffee and most other articles seem to be rapidly diminishing. And this, after all, is only what might have been anticipated. To expect that half-civilised negroes, under a burning sun, and without the wants or desires of Europeans, should be equally industrious, is to expect what contradictory, and all but absurd.

Commerce.—The entire of the wholesale trade is in the hands of foreign merchants, towards whom, however, the most narrow and unwise policy is adopted. They may trade only in the eight free ports, — Port-au-Prince, Gonaïves, Cape Haytien, Port-à-Piate, St. Domingue, Jacmel, Cayes, and Jérémie, for which privilege

they have each to pay at least 1,600 dollars. They are obliged to confine themselves exclusively to foreign commerce; are not permitted to have any transactions with each other, to make local speculations, or buy the produce of the country, except through a native broker; and cannot ~~resell~~ any excess of produce when purchased. The coasting trade wholly belongs to Haytian citizens. The interior is supplied with imported goods by means of hucksters (usually females), the agents of the foreign merchants, with whom they balance accounts weekly. Beasts of burden are commonly used for the conveyance of goods, the roads, except in the N.W., being generally bad, and carriages few. The principal foreign trade is with Great Britain, France, the U. States, Holland, and Germany; besides which there is a considerable smuggling trade between Cayes and Cuba, Jamaica, &c. The chief British imports are printed cottons, muslins, ginghams, coffee bagging, woollens, cutlery, tin, and hardware, earthen and glass ware, cordage, army accoutrements, ammunition, &c. France supplies wines, liqueurs, silks, shawls, gloves, brandy, porcelain, perfumery, and other manufactured goods. The small imports from Holland and Germany include linen fabrics, bagging, inferior woollens, Rhenish wines, Spa and Seltzer waters, &c. The U. States supply lumber, provisions, hides, and colonial produce. The following is a statement of the quantities of the principal articles exported from Hayti during each of the three years ending with 1837:—

Articles.	Quantities exported.		
	1835.	1836.	1837.
Coffee - - - lbs.	48,352,271	37,668,674	30,845,400
Logwood, &c. - -	13,293,737	6,767,902	6,036,238
Cotton - - -	1,649,717	1,074,565	1,013,171
Mahogany - - feet	5,415,516	4,954,944	4,799,262
Cocoa - - - lbs.	597,721	550,484	—
Tobacco - - -	2,088,006	1,222,710	—
Quano - - - No.	8,400	23,000	—
Sugar - - - lbs.	1,097	16,199	—
Hides - - - No.	24,551	14,891	—
Old skins - - -	21,132	77,138	—
Wax - - - lbs.	10,995	16,680	—
Ginger - - -	4,769	15,309	—

In 1836, 569 ships, of 50,580 tons burden, and with cargoes worth 474,7822, entered, and 395 ships, of the burden of 52,483 tons, and with cargoes worth 921,3362, cleared out of the principal port: of the former 84, with cargoes worth 192,2622, and of the latter 99, with cargoes worth 367,3882, were British.* No goods are suffered to remain on board vessels coming to the ports, but are warehoused on payment of 1 per cent. per ann. The following goods are entered free of duty:—arms, ammunition, agricultural implements, horses, cattle, coin, and school-books. The import of mahogany, dye-woods, and other articles produced in the island, sword-sticks, &c. is prohibited, as is the export of arms, coin, old or new iron or copper, horses, asses, and timber for shipbuilding.

The government, though nominally republican, is in reality an elective military monarchy; it is vested ostensibly in a president, senate, and chamber of representatives; but the whole efficient authority is wielded by the chief officer. The president, who must be 35 years of age at the time of his election, holds his office for life; is charged with all the executive duties; commands the army and navy; makes war, peace, and treaties, subject to the sanction of the senate; appoints all public functionaries; proposes to the commons all laws except those connected with taxation; directs the receipt and issue of taxes, &c.; but in case of malversation, may be denounced by the senate, and tried by the High Court of Justice; his salary is 40,000 dollars a year. The ministry consists of a secretary-general, and a financial and a judicial secretary. The senate consists of 24 mems. above 30 years of age, each chosen by the chamber of representatives, from lists furnished by the president. The senate sits nine years; and its previous mems. are re-eligible after a lapse of three years. Each senator receives 1,060 dollars annually. The chamber of representatives consists of 75 mems. chosen every five years by the electoral colleges of the respective communes. Its mems. must be 25 years of age, and each receives 900 dollars a year, besides a dollar a league for travelling expenses. The session of the chambers is limited to three months annually.

The High Court of Justice, composed of 15 judges, has jurisdiction in all charges preferred by the legislative bodies against their own mems., or against the highest state functionaries. There is no appeal from its decision, but the accused has the privilege of rejecting two thirds of his judges. There are 8 provincial, civil, and criminal courts,—at Cape Haytien, Cayes, St. Domingue, Gonaïves, Jérémie, Jacmel, Port-au-Prince, and St. Jago, composed of a president, 8 judges, a government commissary, &c., appeal from which lies to a court of

* The returns of British trade at Cape Haytien are only for the last half of 1836.

cassation in the capital. Ordinary legal cases are decided by justices of the peace, who decide without appeal, in cases to the amount of 80 dollars. Justice is said to be very corrupt, and the police is very inefficient, except in enforcing the *Code Rural*. Fortunately, though petty thefts are common, serious crimes are rare. The legal code is a modification of the old colonial laws of France. By the constitution of 1806, revised in 1816, all Haytian citizens, whatever their origin, are distinguished by the generic name of *blacks*. All Indians, Africans, and their descendants, after one year's residence in Hayti, are entitled to the rights of citizenship; while whites are debarred from either becoming citizens or proprietors of land.

Religion, Education, &c.—The Rom. Cath. is the established religion; but all other sects are tolerated. The church is under the archbishop of St. Domingo, 4 vicars general, and 31 parish priests. The government has appropriated to its own use all the property formerly belonging to the church; the monasteries have been suppressed; the chapter of St. Domingo has now only 6 canons; and the clergy, who are said to be in the last degree ignorant and corrupt, rely for support on voluntary contributions and fees, two thirds of which they must pay into the treasury. The established religion is consequently without any efficiency or influence in the state. Morals are universally disregarded; the private habits of the people are characterised chiefly by filth and laziness; "marriage is scarcely thought of, and the ties consequent on it have not the shadow of an existence."

Christophe made vigorous efforts to extend education, but many of his schoolhouses have been converted into barracks, or to other purposes. The schools founded by the Spaniards, in the E. part of the island, have been suppressed, except the University of St. Domingo, which has still 7 professors, but is little frequented. There are some government schools in the chief towns, a few on the Lancasterian plan, a military school in the cap., and some private academies; but reading, writing, and arithmetic are usually the utmost acquirements of the educated, and these are alleged not to be general, even among the members of the legislature. It is necessary, however, to bear in mind, that we have no very recent and well authenticated information as to the state of Hayti. The friends to the emancipation of the slaves in the British colonies represented it in far too favourable a light, while the opponents of that measure are believed to have exaggerated its defects. The establishment of an independent black commonwealth in one of the finest islands in the world, and in the vicinity of the U. States and of some of the principal colonies of the European powers, was certainly not the least extraordinary event of modern times; and the progress of so peculiar a community might have been expected on many accounts, to have attracted a more than usual degree of attention. But such has not really proved to be the case. And, with the exception of Mr. Mackenzie's meagre, and now nearly antiquated report, we have no full, or official information as to the moral, economical, or political condition of this negro republic; and are compelled, in consequence, to trust to defective and partial statements, and to analogies which, though probable, may not, after all, be well-founded. That such should be the case is not very creditable either to this or other civilised states; and we incline to think that the appointment of a commission to inquire into and report on the state and prospects of the Haytian community, while it could hardly fail to throw a great deal of light on many interesting questions, would be cordially approved by all the intelligent portion of the public.

The *armed force* consists of 33 regiments of the line, of 2 battalions each, 5 regiments of artillery, 2 regiments of dragoons, the president's guard, comprising 3 regiments of cavalry and 2 regiments of infantry, 1 regiment of gens-d'armes, and 8 companies of rural police; in all 28,600 men, exclusive of staff officers. There is, besides, the national guard, composed, with a few exceptions, of all the males from 15 to 60 years of age. These form a body of perhaps 40,000 men, the superior officers of which are chosen by the president, and the inferior ones by the privates. The navy is quite insignificant, consisting of only three or four schooners, and a few small craft.

The *public revenue* is derived from import and export duties, territorial imposts, wharfage dues, taxes on demesnes farmed out, the land tax, stamps, patents, registry taxes, sale of demesnes, &c. In 1837, the public receipts, expenditure, &c. were as follows:—

Receipts, &c.		Expenditure, &c.	
	Dollars.		Dollars.
General receipts	2,982,583	Expenses of gov.	2,984,364
Balance left (1836)	981,633	National debt	536,505
Notes issued	785,400	Notes burned	91,813
Total	3,859,576		
	2,713,102		
Balance, Dec. 31, 1837	1,139,474	Total	2,713,102

In 1825, the president Boyer concluded a treaty with France, by the provisions of which the independence of Hayti was fully recognised; and its ports thrown open to all nations (ships sailing under the French flag, however, paying only half duties inwards and outwards); and 150 millions of francs, in five annual payments, were guaranteed to France as an indemnity for the losses of the colonists during the revolution. The first instalment of 30 millions was paid in 1826; but it being evident that Hayti was utterly unable to repeat the payment of such a sum, the French government, in 1828, agreed to reduce the remaining amount to 60 million francs, to be paid in six instalments by 1837: two of those instalments have already been discharged. (*Encyc. des Gens du Monde*.)

Hayti is divided into 6 departments and 23 arrondissements. Next to Cape Haytien and Port-au-Prince, which have been alternately the capitals, the chief towns are St. Domingo and Cayes.

St. Domingo, a sea-port on the S.E. coast, at the mouth of the Ozama, which forms its harbour, lat. 18° 28' 40" N., long. 69° 59' 37" W., was the first permanent settlement made by Europeans in America, and though greatly diminished in importance, has still above 12,000 inhabs. It is surrounded by old ramparts strengthened by bastions and outworks. Its interior is regularly laid out; the streets, which intersect each other at right angles, are spacious, but not all paved. The houses are in the Spanish style, and many of them are fine substantial buildings. Besides the cathedral, a Gothic edifice, finished in 1540, and reported to have formerly contained the remains of Columbus, there are 9 other churches, 2 convents, 2 hospitals, some large barracks, an arsenal, lighthouse, old and new national palace, prison, &c. The handsome Jesuits' college has been converted into a military storehouse. No monks are to be seen, but in other respects the town has very much the air and character of a Spanish city. The whites and coloured inhabs. far outnumber the blacks. The climate is agreeable, the air being continually cooled by sea breezes. The harbour is both capacious and secure; it has from 10 to 12 ft. of water, but, owing to a bar at the mouth of the Ozama, large ships are obliged to anchor in the roadstead outside, exposed to the S. winds. St. Domingo has a considerable trade with the interior, but its external commerce is now very limited. Cayes, one of the most flourishing towns in the island, is built close to its S.W. shore, lat. 18° 11' 10" N., long. 73° 50' 19" W. Its harbour admits ships drawing 13 ft. water; those of larger size lie in the roadstead of Chateaufort, half a league W. Several British houses are established at this port. A considerable smuggling trade is carried on between Cayes and Jamaica. In the vicinity are upwards of 80 rum distilleries. The remaining towns of the island are now of little importance. (*Mackenzie's Notes on Hayti, and Part. Reports; Franklin's Present State of Hayti; Moreau de St. Mery, Descr. Topog. et Recueil des Lieux Princip. de St. Domingue; Edwards's Hist. Survey; Routier des Antilles; Encyc. Americana.*)

HAZEBROUCK, a town of France, dep. du Nord, cap. arrond., in a fertile tract, 23 m. W.N.W. Lille. Pop. (1836) 4,926. Hugo says that the town is ill built; but other authorities praise the contrary. It has several handsome public buildings, including the town-hall, church, with a lofty and elegant spire, the town-hall, finished in 1820, a fine specimen of classic style, the sub-prefecture, and Augustine convent now occupied by a college, primary school, house of charity, and depot of tobacco. It has manufactures of linen fabrics, thread, starch, soap, leather, salt, beer, oil, lime, &c., and a large Saturday market for these and other kinds of goods. (*Hugo; Guide du Voyageur, &c.*)

HEBRIDES (THE), or WESTERN ISLES OF SCOTLAND, the *Hebudes* or *Ebudes* of the ancients), a series of islands and islets lying along the W. coast of Scotland, partly and principally in the Atlantic Ocean, but partly also in the Frith of Clyde, between 55° 35' and 56° 51' N. lat., and between 8° and 7° 52' W. long. The islands (seven) in the Frith of Clyde constitute a co. (Buteshire), the others belong respectively to the counties of Argyre, Inverness, and Ross. The Hebrides consist of about 200 islands, great and small, and are usually divided into the Inner and Outer Hebrides; the former embracing all those islands which lie nearest to the mainland, including those in the Frith of Forth; the latter consisting of a long continuous range of islands, stretching N.N.E. and S.S.W. from Barra Head, in lat. 56° 49' N., to the Butt of the Lewis, in lat. 56° 51' N. The strait, which divides the Outer Hebrides from the Inner, and from the mainland of Scotland, is called the Minch, and is where narrowest, from 15 to 16 m. across. The Outer Hebrides are commonly called the Long island, and appear, in fact, as if they had originally consisted of one lengthened island, divided at a remote era into its present portions by some convulsion of nature. Lewis and Harris (which are more extensive than all the rest put together), though considered as separate, form, in fact,

only one island, and the sounds, or arms of the sea, which intervene between the larger islands of the group, are so interspersed with islets, that the range is still nearly continuous. The following table contains a list of the principal islands of which the Inner and Outer Hebrides are respectively composed, with their estimated extent in sq. m.

Inner Hebrides.	Sq. m.	Outer Hebrides.	Sq. m.
Bute, Arran, and the other islands constituting Buteshire	165	Barra, including the islets Vatersay, Sandray, Raiboy, Mingavay, and others dependent on it	51½
Gull	28	Benbecula, with its subsidiary islets	43
Collonsay and Oronsay	12	Harris, with do.	191
Higha and Cara	8	Lewis, with do.	557
Isna or Isomkiff	10	North Uist, with do.	118
Islay	308	South Uist, with do.	127
Jura	84	St. Kilda	9
Kilmore	10	Add, for several islets or rocks not included in the foregoing	20
Lorn Islands, or Scarba			
Lunga, Laing, Naill, Munna, Eudale, Kerrera, &c.	50	Inner Hebrides	1,096½
Mull	301		1,653½
Nassay	31½	Total extent of Hebrides	2,750
Skye	535		
[Scalpa, Rona, and other islets depending on Nassay or Skye]	20		
Small islands, or Campa, Rum, Eigg, and Muck	55		
Staffa	1½		
Tyre	26½		
Ulva	24		
Total	1,653½		

The total extent of the Hebrides may, therefore, be estimated at about 2,750 sq. m., or 1,760,000 acres, of which 64,000 are lakes. They are divided into 30 parishes, of which 5 are in the islands in the Frith of Clyde, 17 in the Inner Hebrides, and 8 in the Outer Hebrides.

The following table shows the pop. of the Hebrides in 1801 and 1831; with the number of males and females, and of families and inhabited houses in 1831.

Divisions.	1801.	1831.	Males.	Females.	Families.	Inhab. Houses.
Buteshire, or Islands in the Frith of Clyde	11,791	14,151	6,495	7,656	2,998	2,134
Inner Hebrides exclusive of Buteshire	40,537	57,839	28,331	29,508	10,653	10,055
Outer Hebrides	21,694	32,051	15,290	16,741	6,269	6,131
Totals	74,022	104,021	50,116	53,905	19,260	18,320

As the total number of acres is, according to the foregoing table, 1,760,000, and of individuals, in 1831, 104,021, it follows that the average density of the pop. is nearly 48 to a sq. m.; while the average pop. of the rest of Scotland is 86 to a sq. m.

The pop. has considerably increased since the census of 1831. The increase in the Outer Hebrides, in 1836-38, was 3,870; in the Inner Hebrides, including Buteshire, 2,063; total, 5,440. Of the 200 islands of which the Hebrides consist, more than half are so small, or so sterile, as not to be inhabited. In 1808, only 79 were regularly inhabited during the whole year; while 8 were tenanted during the summer, and abandoned on the approach of winter. The greater portion of the people reside within a mile of the sea-shore: in fact, except in the islands of Bute and Islay, scarcely an inhabited house can be seen 1,000 yards from the sea-shore, or 300 feet above the level of the sea. (*Remarks on the Highlands and Islands of Scotland, by Fullerton and Baird. Glasgow, 1838.*)

From the thinness of the pop., it is not to be expected that schools should be every where, or be easily accessible to the inhab. of every district; but each par. has at least one parochial school, except Barra, which has no school of any kind. Four of them have two parochial schools, one of them has three, and two have four: total number of parochial schools, 43. This is exclusive of 149 non-parochial schools, of which those founded by the General Assembly's Education Committee, and the Society for the Propagation of Christian Knowledge, form a part. But notwithstanding the great number of schools, parochial and non-parochial, there were, in 1833, no fewer than 26,163 individuals, above six years of age, unable to read either English or Gaelic! (*Rep. of Gen. Assembly's Com., May, 1833.*) The following table contains a statement of the number of schools, the greatest number of scholars in attendance, and the number of those above six years of age unable to read or write. [See top of next column.]

There is one par. (Kilmenny, in Islay) from which no return has been received as to the number of individuals at school; but taking it at the rate of the other islands, it will be about 630; so that the aggregate largest num-

Divisions.	No. of Parochial Schools.	No. of Non-parochial Schools.	Greatest Number of Scholars at both kinds of Schools.	No. of Persons unable to read and write.
Islands in the Clyde Buteshire (6 parishes)	11	27	1,869	Few, if any.
Inner Hebrides, exclusive of Buteshire (17 parishes)	24	88	5,702	18,133
Outer Hebrides (8 parishes)	7	34	2,012	17,719
Totals	42	149	9,583	36,162

ber of persons at school in the Hebrides is 10,213, or nearly a tenth part of the pop. If this proportion continue (and there is every reason to believe that it will increase rather than diminish), there will very soon not be a single individual in this group of islands (except perhaps in remote or very thinly peopled corners) unable to read or write. It will be observed, that the means of education are the most limited, and the number of persons uneducated greatest, in the Outer Hebrides. In some of the smaller islands, such as Canna, Rum, &c. there are no schools, and not one of the inhab. can either read or write. (*Educational Inquiry, Scotland, Part. Pap. Sess. 1837, vol. xviii.; Gen. Assembly's Rep.; and Fullerton and Baird, ut supra.*)

Gaelic or Celtic is the language spoken throughout the whole extent of the Hebrides; and in some of the more remote or thinly inhabited islands, it is still the only language used or known. But both English and Gaelic are now taught in almost every one of the schools, and the former is becoming common, and, in some instances, has almost superseded the use of the Gaelic. A few families, chiefly farmers from the lowlands of Scotland, have, of late years, settled in different parts of the Hebrides; and this, combined with the increased facilities of communication with the low country and with England which steam navigation affords, has had the effect of diffusing a more general knowledge of the English tongue than would otherwise have been the case. Speaking of the more populous portions of the Hebrides, we may say that there are few persons, if any, under 30 years of age, who do not understand English, though, with slight exceptions, Gaelic continues the language of common conversation. Gaelic was not, till about the beginning of last century, a written language*; but the Bible, and a great variety of religious as well as miscellaneous books, have since been translated into it; and Gaelic grammars and dictionaries have also been published. These things have been done, not with the view of perpetuating the knowledge of a rude language, but of diffusing information among the inhabitants; but we are by no means clear that this would not be better attained by teaching English exclusively in schools, and making it the sole medium for popular instruction.

The 30 parishes of which the Hebrides consist have each a par. church, and a resident clergyman. There are, besides, 14 *quoad sacra* chapels belonging to the established church, 6 chapels belonging to the R. Catholics, 3 to Presbyterian dissenters, 2 to the Episcopalians, and 1 to Independents; the total number of places of worship being 50. In some of the islands, particularly Barra, Eigg, and S. Uist, Catholicism abounds, to the entire exclusion of almost every other creed. The Catholic priests do not confine their labours to the islands in which they have their head quarters, but periodically visit all those in their neighbourhood where a single member of their church is to be found. Missionaries, belonging both to the established church and to the dissenters, are common throughout the Hebrides.

Though a poor-law has existed in Scotland since 1579, and is at present in operation in 236 Scotch parishes, it is practically unknown in the Hebrides. Limited as are the means of the inhab., the poor are supported exclusively by the collections made at the church doors on Sunday, by (in some cases) other voluntary contributions, and by seasonal funds; a legal assessment for their behoof having never, in one single instance, been adopted.

It appears, from the official returns, that the poor receiving relief are only as 1 to 51 of the inhab., that the average annual amount given to each individual is 11s. 4d.; and that the cost averages rather less than 2d. to each head of pop. The lowest allowance is in a parish (Kilmuir) in the Isle of Skye, in which 51. is divided among no fewer than 110 persons, averaging scarcely 10d. each annually, the highest sum given being 1s. 6d. This insignificant degree of assistance is scarcely approp-

* The first books published in it were a version of the Psalms, and a translation of the Shorter Catechism, by the Synod of Argyle, in 1690.

chable, and proves how extremely destitute the people must be, and how low their estimate of physical comfort, when such a miserableittance can be of any valuable benefit, or an object of desire. (*Report of General Assembly on Poor in Scotland, Parl. Papers, 1839.*)

The climate of the Hebrides is more humid, variable, and inhospitable, than that of any other part of the British dominions. "The temperature of the atmosphere is variable, the climate very rainy, and the air extremely moist; inasmuch that when a person walks by the sea-side, in a hazy atmosphere and under a cloudy sky, the saline particles rest like dew on the pile of his coat. The dampness of the air is such, that in rooms wherein fires are not constantly kept, the walls emit a hoary down of a bluish taste, resembling powdered saltpetre, when brushed off. The climate is an enemy to polished iron and to books. Frequent and heavy rains fall at all seasons, especially after the Lammass term, whereby the hopes of the husbandman are often blasted, and the fruit of his toil and industry in a great measure lost." (*New Stat. Account of Scotland, No. 12, p. 118.*) In the Outer Hebrides winter lasts for six months, from the end of Oct. to the end of March: spring, summer, and autumn occupy the other half of the year. "During the spring, E. winds prevail, at first interrupted by blasts and gales from other quarters, accompanied by rain or sleet, but ultimately becoming more steady, and accompanied with a comparative dryness of the atmosphere, occasioning the drifting of the sands to a great extent. Summer is sometimes fine, but as frequently wet and boisterous, with S. and W. winds. Frequently the wet weather continues, with intervals, until Sept., from which period to the middle of Oct. there is generally a continuance of dry weather. After this, W. gales commence, becoming more boisterous as the season advances. Dreadful tempests sometimes happen through the winter, which often unroof the huts of the natives, destroy their boats, and cover the shores with immense heaps of sea-weeds, shells, and drift timber." (*Macgillivray's Acc. of the Outer Hebrides, Edinburgh Quarterly Journal of Agric., No. 11, p. 274.*) These remarks are applicable, with very slight modifications, to the whole range of the Hebrides; the islands in the Frith of Clyde excepted; in which latter, the climate, though damp and variable, is comparatively genial and mild.

In addition to the unfavourable climate, the Hebrides are remarkable for their rugged and sterile soil, more than six sevenths of their superficial extent consisting of irremediable mountains, morasses, &c.; while the extent of arable and meadow land under grass, hay, corn, and potatoes, is little more than a ninth part. Assuming the whole extent of the islands to be equal to 1,592,000 Scotch acres, or about 2,000,000 English (an estimate somewhat different from that given in this article), Mr. McDonald, in his excellent *Agricultural Survey of the Hebrides*, supposes it may be distributed as follows:—

Mountains, morasses, and undrained lakes, scarcely yielding any specified rent to the proprietors	Acres.
Hill pasture, appropriated to particular farms, and sometimes enclosed, or at least limited by acknowledged marches, as lakes, rivulets, &c., and paying rent	600,000
Arable and meadow land, under grass, hay, corn, and potatoes	700,000
Kelp shores, dry at ebb-tide, regularly divided among the tenantry, and producing 8,000 tons of kelp, besides manure, annually	180,000
Ground occupied by villages, farm-houses, gardens, gentlemen's parks, &c.	30,000
Ground occupied by peat-mosses annually; and by roads, ferry-houses, and boats	20,000
Barren sands, tossed about by the winds, and pernicious to their vicinity	22,000
Ground occupied as glebes, or, in lieu of glebes by established clergymen, manse, churches, and churchyards	25,000
Ground occupied by schoolmasters	8,000
Ground under natural woods, coppices, and new plantations, chiefly in Bute, Islay, Mull, and Skye	2,000
Total	1,592,000

But, while the arable and meadow land is so limited, it is, at the same time, light, sandy, and poor, with some exceptions, in Islay and a few other islands, and unsuceptible of much improvement. The ordinary produce is black oats, barley or bigg, and potatoes. Mr. McDonald distributes the arable land as follows:—

INNER HEBRIDES.		Acres.
Bute, 8,000, Arran, 10,500 =		18,500
Orkney		1,500
Shetland		22,000
Jersey		5,000
Colonsay and Oronsay		5,500

Orkney, 1,000, and the other Lorn Islands, 6,500 =	Acres.
Small and dependent islands	6,500
Shetland	10,000
Orkney	4,000
Jersey	5,000
Small islands, or Camps, Runt, Wig, and Muck	20,000
Shetland and Rona	2,500
	3,000

Outer Hebrides.		
North and South Uist, and Barra, with the Isles S. of the Sound of Harris		40,000
Lewis and Harris		26,000
St. Kilda		500
Total		180,000

Other authorities give somewhat different results; and the reader may compare on this subject *Mr. Donald's Survey, with Appendix to Gen. Report of Scotland, No. 3; Fullarton and Baird's Remarks, p. 104, 105; and New Stat. Acc. of Scotland.*

Not only, however, are the soil and climate unpropitious, but the tenure on which lands are held is, with some exceptions, as objectionable as possible. A very great majority of the farmers are tenants at will or from year to year; in other words, having no lease, they are liable to be turned out at the end of any year. This wretched system prevails almost universally in the Outer Hebrides. In the islands in the Frith of Clyde, it was laid aside in 1815, and superseded by leases; but in the remaining Inner Hebrides it still holds about three fourths of the land under its fetters, and nine tenths of the farmers. Besides, where leases are given, they generally range from 5 to 7 years, seldom extending to 9 or 12. Wherever this miserable system extends, there is a total apathy as to agricultural improvement. A tenant at will is almost sure to remain undisturbed if he follow in the beaten track of his predecessors; but should he try experiments, or execute any very considerable improvement, he is afraid lest a greater advance of rent should be demanded of him than the improvement may warrant, or that he may be ejected from the farm altogether. Hence, though a tenant at will may retrograde or may remain stationary, he very seldom advances, or advances only by almost imperceptible degrees. "Whatever may be the nature of the possession," to quote from an excellent authority, "it cannot be imagined that any farmer of capital and skill should embark either on a property of which, in many instances, he can get no lease at all, or of which he is offered a lease of a duration too short to afford any hope of his being remunerated for his labour and expense before its termination. In Islay and some of the other large islands of the Inner Hebrides, leases of 19 years are given, and there the consequences appear in the systematic Potato of crops, and the general improvement of the country. The tenants, in such cases, are in every respect on a footing with those in any part of Scotland. They are in circumstances of comfort, respectability, and independence. But the situation of a tenant at will is, in the highest degree, discouraging and uncomfortable. When he is without a lease, he is liable to be turned out any term, however impossible it may be to obtain elsewhere a place of refuge or protection for himself and his family. When he has a lease of a short duration, the only difference is that this painful state of things occurs at periods a little more remote from each other. The effect in both cases infallibly is, to beget, on the part of the tenant, a carelessness about improvement either of the farm or the family; which being for a certain time allowed to remain uncorrected, brings the most certain and irrefragable ruin upon both the one and the other." (*Fullarton and Baird, p. 59, 60.*)

In addition to the baneful system of tenants at will, another practice, that of parcelling the land into small farms, is still more unfavourable to improvement. Though on some of the islands, as Islay, Bute, Arran, and Skye, large farms are met to be found, they are usually small, the rents ranging from 5*l.* to 40*l.* a year. The small farmer, or crofter, who almost universally is a tenant at will, is nearly in every case devoid of capital, and cannot therefore, though he was willing, engage in any thing like improvement. The truth is, as universal experience has shown, that land, when let in small patches, is uniformly ill cultivated; no proper system is or can be adopted as to cropping or manure; but every year as much is extorted from the soil as it can produce. Besides, small farms are always let at proportionally higher rents than large ones. In the Outer Hebrides, the crofter depends as much on fishing and burning kelp for payment of his rent as on the produce of his farm; and his whole life is a continual struggle with poverty and wretchedness, without improvement, or hope of improvement. But, in addition to the pernicious systems of tenants at will, and of small farms, another vicious practice prevails, viz., that of *subletting*. This practice has been in operation for ages, and though it has been checked in some of the islands, it is still very general, and wherever it exists, it is most pernicious.

High as the rest of small farms is, when held directly from the landlord, lands that are sublet are always higher. Indeed, such lands are generally let far above their real value; and the sub-tenant becomes, in the majority of cases, the immediate dependent of the farmer of whom he holds his lease, and not unfrequently pays part or the whole of his rent, by labouring in his service, to the neglect of his own wretched patch of ground.

The system of *tackmen*, which corresponds to that of middlemen in Ireland, also exists. The tacksmen hold considerable tracts of land directly from the landlord, at a certain specified rent; which they relet to others in smaller portions, and at a higher rent. A tacksmen is seldom so considerate or liberal as the landlord; hence, not only are rack-rents exacted by the tacksmen, but comparatively little accommodation or generosity is extended to the sub-tenant. But this is not all: the system of joint tenancy also prevails in the Hebrides: under this system a number of persons, sometimes as many as 10 or 15, take a farm, in which is taken a running or partnership, who are jointly and severally liable for the rent. Each farm thus becomes a *societas arandi*, containing perhaps as many families as there are partners in the lease, each field being divided into as many stripes, separated by a narrow ridge called "a bone," where the stones, weeds, and other rubbish gathered off the land are accumulated. The share or stripe, which in some cases does not exceed 3 acres, belonging to each partner, is determined by lot, and is changed every second or third year, according to the arrangement of the parties. Ploughing and most sorts of labour are performed in common; and if there be but pasture land, it too is held in common; and when the crops are secured at the end of harvest, sheep, cattle, horses, and hogs range at large over the whole farm. It is obvious that this associated form of occupancy precludes all draining, enclosing, and laying down in grass; in short, presents an insuperable barrier to all improvements either of stock, or of land. Indeed, this mode of holding land is, if possible, more pernicious than any before specified; but we are glad to have to state that it is everywhere declining, and will, it is likely, soon disappear altogether. (See Appendix.)

Hence, with the exception of the islands in the Frith of Clyde, and of Islay, Collonsay, and some portions of Skye and Mull, in all which large farms and other improvements have been more or less introduced, agriculture is in a backward state as can be imagined. Generally there is nothing like a rotation of crops. The grains usually cultivated are bear or bigg, and the old Scotch grey oat. In the *outfield*, which means that portion of a farm nearest the hills, and farthest from the farm-house and offices, one miserable crop follows another till the ground be thoroughly exhausted. It is then allowed to rest, yielding for several years nothing but weeds; and as soon as these begin to disappear, by the return of grass and heath, it is again broken up to undergo the same exhausting process. In the cultivation of the *infield*, the system pursued is nearly as injudicious. No regular rotation is followed; but the general rule is,—1. oats; 2. oats; 3. potatoes and peas; 4. barley or bigg, with manure; 5. pease; 6. oats; 7. two years of pasture choked with weeds, unsown by sown grasses, and therefore deficient both in quality and quantity. In a few places only has draining been practised; and without a very extensive system of drainage, no material alteration can be made for the better. In places not drained or levelled, the implements of husbandry are of the same rude and barbarous description that they were nearly a century ago. In the Outer Hebrides, "small tenants and cotters generally till the ground with the Chinese plough, of one stilt or handle, and the *casachrom*, a clumsy instrument, like a large club, shod with iron at the point, and a pin at the ankle for the labourer's foot. This antiquated implement will soon be superseded by the spade, which has now come into almost general use. But the plough is never seen, except in cases of large farms. The common mode of turning the ground is by what is called *teeming*, forming a kind of lumpy beds, such as are made in Ireland for the planting of potatoes. At this work two persons are employed, one on each side the ridge, which is seldom in a straight line, collecting the earth; and the earth, burrowed in this way, makes a proper bed for the seed. The ground being prepared, the seed is sprinkled from the hand in small quantities: the plots of ground being so small, narrow, and crooked, should the seed be cast as in large long fields, much of it would be lost. After sowing the seed, a harrow, with a heather brush at the tail of it, is used, which men and women drag after them, by means of a rope across their breasts and shoulders. The women are miserable slaves: they do the work of brutes, carry the manure in creels on their backs from the byre to the field, and use their fingers as a five-pronged gripe, to fill them. In harvest, when the crop is ripe, no sickle

is used for the barley among the small tenants. The stalk is plucked; the ground is left bare; and consequently the soil is injured. When the sheaves are dry, and conveyed to the barn-yard, the sickle is then used to cut off the heads or ears. After this operation, all the heads are formed into a little stack covered with the roots of the sheaf, which has been cut off." (*New Stat. Acc.*, i. Lewis, p. 181—183.)

It may be further mentioned, that, except in Arran, Islay, Jura, and Skye, where roads have been made by Parliamentary commissioners, assisted by the local landlords, roads or bridges can hardly be said to exist in the Hebrides; in some islands there is not a vestige of either. Of course, carts cannot, under such circumstances, be introduced. These, indeed, are confined to large farms and districts where roads have been constructed. In the less improved islands, all sorts of articles are conveyed either in panniers, slung across horses' backs, or by sea in boats. The advantages of good internal communication may, therefore, be said to be only partially known in the better portion of the Hebrides; in the remaining parts, which comprise about four fifths of the pop., they are almost entirely unknown.

It is well known that the system of small farms, subletting, and joint-tenancy, has a powerful tendency to give a factitious impulse to pop. And there is, in fact, in many instances, in the Hebrides, a great excess of pop.; and when any reverse comes, when the crops or the fishery fail, the people, having no capital on which to fall back, are unavoidably and at once exposed to all the horrors of famine. An instance of this took place in 1836, when the distress was so general and alarming, that an appeal was made on their behalf, not merely to the Scotch public, but to that of the united empire; and a sum of no less than 50,000*l.* was, in a few months, raised for their relief.*

The pop. of the Hebrides has also been greatly increased by the introduction of the potato, which is now become the principal food of the people. It is, in fact, alleged that four fifths of the inhab. live principally on this root. And as the potato crop is more exposed to fluctuation than that of corn, they are placed in a proportionally perilous situation.

Parsons's account of the inhab. of Islay, though no longer applicable to them, Islay having been most materially improved in the interval, is still strictly applicable to those of most of the other islands. "A set of people worn down by poverty, their habitations scenes of misery, made of loose stones, without chimnies, without doors, excepting the faggot opposed to the wind at one or other of the apertures, permitting the smoke to escape through the other, in order to prevent the pains of suffocation. The furniture perfectly corresponds: a pot-hook hangs from the middle of the roof, with a pot pendant over a grateless fire, filled with fire that may rather be called a permission to exist, than a support of vigorous life: the inmates, as may be expected, lean, withered, dusky, and smoke-dried." (*Tour in Scotland*, ii. 263.)

Those who compare this striking paragraph with the description given in the *New Statistical Account of Scotland* of the houses in the Lewis and other islands, will find that it is, if any thing, really too favourable. There the dwellings of the people are, speaking generally, wretched huts, that afford shelter not only to the cotters and their families, but also to their cattle and pigs:

—Ignemque, laremque,
Et pecus, et domos communis claudere tumbas.

These huts, which are only half thatched, and without windows or chimnies, are indescribably filthy, and are, in fact, inferior even to the wigwams of the American Indians. The dung and other filth collected in and round the hut, is only removed once a year, when it is carried to the potatoe or barley field; and where also it is not unusual to strip the new cut of the hut, and to apply it to the same purpose. (*New Statistical Account*, art. *Hoss and Cromarty*, pp. 129, 147, &c.)

It is right, however, to state, that these miserable huts have nearly disappeared from the estates of Mr. Campbell of May, of Lord Macdonald in the Isle of Skye, of the Duke of Hamilton in Arran, &c.; and the probability is, that they would in no very long period wholly disappear, were it not for the embarrassed circumstances of many of the landlords, and their inability to undertake any improvement that requires any considerable outlay.

The dress of the people corresponds with their food and houses. The *kilt* and *trews*, the characteristic Highland dress, are rapidly disappearing, and are no longer to be found in Skye and some other islands. Home-made woollen stuffs, checked or blue, are the universal dress both of men and women. Cotton and linen shirts are not generally in use, except on Sundays; but the dress, as well as the manners of the more civilised parts of the

* Several Highland districts on the mainland were, at the same time, and from similar causes, involved in the like distress; and the sum in question was distributed in common in these districts and in the Hebrides.

empire, is beginning to make its way into these sequestered recesses. Wherever a steamer is seen, Manchester or Glasgow cottons will be found not long after.

The manufacture of kelp and the fishery, once the principal employments in the Hebrides, have declined very much of late years. Kelp is formed by burning seaweeds, previously dried in the sun; the alkaline substance thus formed being used in the manufacture of glass, soap, and alum. The annual produce of kelp towards the close of the late war has been estimated at about 6,000 tons. Its price was sometimes as high as 30s. a ton; but its average price, during the 23 years ending with 1822, was 10s. 9s. 7d. (*Encyc. Brit., art. Scotland.*) And such was the influence of the manufacture, that the kelp stores of the island of N. Uist let at one time for 7,000l. a year; but the foundations on which this manufacture rested were altogether unsound. The repeal of the exorbitant duties laid on barilla and salt, especially the latter, virtually annihilated the manufacture of kelp. Its price, instead of averaging upwards of 10l. per ton, has been so low as 1l. 10s., but ranges generally between 3l. and 4l. The manufacture is still carried on in some of the islands, though in some instances at a considerable loss, instead of a profit. (*Fullerton and Baird, — App. table iv.*) The loss to the Hebrides, however, has been only apparent. The manufacture withdrew the attention of the islanders from what would have been more profitable pursuits. Being engaged during summer and harvest at the kelp shores, their crofts and crops were both neglected; and the sea-weed which had been laid on the land, would have been the best possible manure, was carefully collected and carried off. Although, therefore, the ruin of the kelp trade was injurious to several proprietors, and was extensively felt at the time, it was productive of no real injury to the islands; but, on the contrary, will, in the end, conduce materially to their advantage.

The herring fishery has also, of late, been declining in the Hebrides. The restrictions and encouragement given to this business by government (which ceased in 1830), did not raise it to any considerable importance; nor has the abolition of the salt tax and the freedom of the trade been more successful. This has arisen from various causes, such as the want of encouragement on the part of the landlords, who are the only capitalists belonging to the country; the want of continuous application, and, consequently, of skill on the part of the fishermen, who, being at the same time farmers, are not, and indeed cannot be, proficient in either employment; and especially from the herring, which is very capricious, having comparatively deserted the W. shores of Scotland. In 1837, only 22,736 barrels of herrings were cured, gutted and ungutted, at Stornoway, Rothesay, and Tobermory.

The rearing of black cattle and sheep is the most extensive and profitable business in the Hebrides. The introduction of large farms into some of the islands has given a powerful stimulus to grazing, and black cattle are, in fact, the staple product of the Western Islands. The Kyles, or West Highlanders, are the general breed, of which the best specimens are to be found in Skye; they are hardy, easily fed, not injured by travel, and, when fattened, their beef is finely grained, and is, perhaps, superior to any brought to table. The stock is estimated at not less than 20,000 head, exclusive of the islands in the Clyde, of which about a fifth part are annually exported lean to the mainland for fattening. When sold lean, their weight ranges from 13 stones to 30; but when fattened, it often rises to 50; but the average is from 24 to 36. The native breed of sheep is small, weighing only from 15 to 20 lbs.; weight of fleece (which is of various colours, even in the same fleece), from 4 to 1 lb. Both the black-faced, or mountain breed of sheep, and Cheviots have been latterly introduced with success; the former to the greatest extent. Mr. McDonald estimated the number of sheep in the islands, in 1811, at rather less than 100,000; it cannot be less at this moment than 120,000.

The Hebridean horses are small and hardy; but they are not so handsome as those of the Shetland Isles. They are, however, extensively exported.

The woods and plantations in the Hebrides, in 1811, were estimated at 6,000 Scotch acres. Their extent has greatly increased in the interval, particularly in Skye, Mull, and Islay. But in the Outer Hebrides there are no trees; and, except in a very few spots, none can be raised. Turf or peat is the common fuel in all the islands; in some islands, as Tyree, Iona, and Canina, moss being deficient, the greater part (in Tyree, the whole) of the fuel has to be imported, chiefly from Mull, a third part of the industry of the inhabs. being required to supply themselves with this indispensable article. Limestone is found in several of the islands, particularly Islay, whence it is exported in considerable quantities. Lead mines have also been long wrought in Islay, but not with any spirit. Marble is found in Tyree and other places, and slate in Easdale and the adjacent islands: both are pretty largely exported.

Manufactures, in the usual meaning of the word, are

entirely unknown in the Hebrides, if we except two cotton mills, employing 485 hands, at Rothesay, and 12 distilleries in Islay, producing above 250,000 gallons of spirits a year. The people manufacture their own clothing from wool and flax of their own raising; and each head of a family makes the greater part of the utensils, implements, and furniture they require. Boat-building is carried on to a small extent at Tobermory, Stornoway, and several other places. With the exception of one or two common trades, such as those of a tailor, shoemaker, and joiner, the division of employments is nearly unknown; every person carrying on different kinds of business at different seasons of the year, and even at different hours of the day. In some of the smaller islands, there are no day-labourers, the small farmer and his family doing all kinds of work. (*Fullerton, p. 121.*) The wages of labour are, in almost every instance, per day. There are 6 branch banks, 3 in Rothesay, and 1 each in Islay, Portree (Skye), and Stornoway.

The introduction of steam navigation has contributed largely to the improvement of the Hebrides, particularly the islands in the Clyde, with which there is a regular steam communication every day, and the Inner Hebrides generally; but the Outer range is scarcely ever visited by steamers. Not only are the former resorted to by numbers of strangers, from whose superior intelligence the inhabitants derive much advantage, but the steam-boats create a taste, and open a market, for various articles for which there was previously no demand, and afford a ready means of conveying articles of native produce to Glasgow, Greenock, and other places. These facilities of intercourse and exchange are continually being extended, and have a most beneficial effect on the character and circumstances of the Hebrideans.

There are about 50 landlords, of whom Mr. Campbell, of Islay; Lord Macdonald; the Duke of Hamilton; Mr. Stewart Mackenzie, of Seaforth; Macleod, of Macleod; the Marquis of Bute; and Maclean, of Coll, are the largest. The landlords generally are becoming more alive to the importance of large farms, and agricultural improvement. Islay, which belongs almost entirely to Mr. Campbell, has been justly denominated the Queen of the Hebrides. The soil rests on a bed of limestone, and yields good crops of wheat and other grain, of which it exports considerable quantities. An improved rotation of crops has been introduced, comfortable houses and offices have been built, roads and harbours have been constructed, and all sorts of improvements are carried on with spirit and success. Lord Macdonald has also laid out immense sums on the improvement of his estates in Skye; and we have elsewhere noticed the extraordinary change that has been effected in the island of Arran, under the auspices of the Duke of Hamilton. (*See ARRAN.*)

The rental of the Hebrides, in 1815, was 102,328l. It is now (1840) estimated at from 110,000l. to 120,000l. The exports are black cattle, sheep, kelp, wool, cod and ling, herrings; the imports are iron, groceries, salt, oatmeal, &c.

There are only 10 attorneys in the Hebrides, of which a half are in Rothesay, and only one (Stornoway) in the Outer Hebrides. Some of them are also bank agents, and engaged in employments other than law. There are only 5 constables in the whole range of the islands, and soldiers are neither known nor required; and the greater number of the islands are destitute of surgeons, and even inns. The nearest hospitals are in Greenock and Inverness. There are no printing-presses, nor, of course, any native newspaper.

The Hebrides have few remains of antiquities, excepting those of the cathedral and other religious buildings of Iona, a small but famous island (3½ m. long by 1 m. broad), situated 9 m. S.E. Skye, and 1 m. from the S.W. point of Mull. These ecclesiastical ruins are of the most venerable description. St. Columba, who introduced Christianity here from Ireland in 563, and whose successors, and those who adopted his creed, are known under the name of *Culdees*, is said to have built the cathedral; but it is abundantly evident that it was erected at a considerably later period. Of the buildings, some belong to the Roman, some to the Gothic, and others to the Norman style. The successors of Columba were expelled from the island by the Danes in 807; but two orders of monks, the Benedictines and the Augustines (nuns), took possession of the place in the 12th century, and flourished there till the general abolition of monasteries at the Reformation, when the island became the property of the family de Argyll, to which it still belongs. The remains of these various establishments, which cover several acres of ground, consist of the cathedral, St. Oran's chapel, the chapel of the nunnery, five smaller chapels, and other dependent buildings. The cathedral is cruciform, with a tower 70 ft. high: the length from E. to W. is 160 ft., the breadth 24 ft.; the length of the transept 70 ft. Within the precincts of the cathedral are two crosses, the one called St. Martin's, the other St. John's. A large space around

these buildings was used as a cemetery, in which were interred the remains not only of their religious inmates, and of several Highland chieftains and families of distinction, but (it is said, though the statement is probably much exaggerated) of 48 Scottish and 16 Norwegian kings, and 1 French and 4 Irish sovereigns. Of 360 native crosses erected on the island, only 4 remain. (*Keltic Cat. of Scot. Bishops*, ed. 1824, pp. 414, 458; *Pennant's Scotland*, II. 285.). There were five other monasteries in the Hebrides, viz., in Oronsay, Colonsay, Crusay, Lewis, and Harris; but of their history nothing is known, and few remains can be traced of their existence. (*Keltic*, pp. 385-393.)

Iona, as every body knows, was visited by Dr. Johnson in his tour to the Western Islands. He has described his sensations on visiting it in the following noble passage, which never can be too often quoted:—"We were now treading that illustrious island which was once the luminary of the Caledonian regions, whence savage clans and roving barbarians derived the benefit of knowledge, and the blessings of religion. To abstract the mind from all local knowledge would be impossible if it were endeavoured, and would be foolish if it were possible. Whatever withdraws us from the power of our senses; whatever makes the past, the distant, or the future, predominate over the present, advances us in the dignity of thinking being. Far from me, and from my friends, be such frigid philosophising; my conduct is indifferent or unmoved over any ground which has been dignified by wisdom, bravery, or virtue. That man is little to be envied whose patriotism would not gain force upon the plains of Marathon, or whose piety would not grow warmer among the ruins of Iona."

Of the early history of the Hebrides nothing certain is known. They recognised for a lengthened period the sovereignty of the Norwegian kings, but were, in 1264, annexed to the crown of Scotland. Owing, however, to their remote and inaccessible situation, their chieftains were for centuries afterwards lawless and turbulent, and assumed and exercised almost regal authority. Indeed, it was not till the abolition of hereditary jurisdictions, in 1748, that a final blow was given to the influence of the independent chieftains of the Western Islands.

The Hebrideans, in 1715 and 1745, were almost to a man in favour of the exiled family of Stuart. Charles landed on the small island of Glisca, to the S. of S. Uist; and after the battle of Culloden, he took refuge, first in the Outer Hebrides, and afterwards in Skye, previously to his escape to France. We need only further mention that, owing to the introduction of the system of large farms, and the consequent superseding of the small tenants, the latter have emigrated extensively to Canada. The landlords have not unfrequently furnished them with the money required for their passage across the Atlantic.

HECLA, or HEKLA (MOUNT), a famous volcano of Iceland, near the S.W. coast of the island. Its height was estimated by Sir G. Mackenzie at about 4,000 feet, or probably less; but, according to later authorities, it has an actual elevation of 5,210 ft. "On approaching," says Sir G. Mackenzie, "Hecla from the W., it does not appear remarkable; and has nothing to distinguish it among the surrounding mountains, some of which are much higher, and more picturesque. It has three distinct summits, but they are not much elevated above the body of the mountain." The crater, of which the highest (or N.) peak forms a part, does not much exceed 100 feet in depth. The bottom is filled by a large mass of snow, in which various caverns have been formed by its partial melting. The middle and lower peaks form the sides of similar hollows, and on the ascent are numerous other craters, whence flames and other matter have at different times been ejected. Hecla, like the Snæfelli Jokul, near the W. extremity of the island, terminates in a long group of comparatively low hills. These, and others surrounding, are almost wholly composed of tufa, closely resembling that of Italy and Sicily; but the mountain itself consists chiefly of columnar basalt and lava, which latter forms a rugged and vitrified wall around its base. All the upper part of the mountain is covered with a layer of loose volcanic matter, slag-sand, and ashes, which increases greatly in depth towards the top. In this part, indeed, few traces of any other substances are to be seen. Mackenzie says, "We could not distinguish more than four streams of lava, three of which have descended on the S., and one on the N. side; but there may be some streams on the E. side, which we did not see." (*Travels*, p. 249.) The view from the summit is one extended scene of frightful desolation. Towards the N. the country is low, except where a jokul here and there towers into the regions of perpetual snow. Several large lakes appear in different places, and among them the Fiske Vain is the most conspicuous. In this direction the prospect reaches nearly two thirds across the island. The Blifelli and the Lange Jokuls stretch themselves in the distance to a great extent, presenting the appearance of enormous masses of snow heaped up on the plains. The Skaptar

Jokul, whence the great eruption in 1783 broke forth, bounds the view towards the N.E.: this is a large, extensive, and lofty mountain, and appears covered with snow to its very base. The Torfa, Tinfalla, and Eyafalla Jokuls limit the view to the E. To the S. is an extensive plain covered with lava, rugged with sharp stones and other volcanic substances, imbedded in the soil, and bounded by the sea.

There is, perhaps, no country where volcanic eruptions have been spread over so large a continuous surface as in Iceland, no part of the island being wholly free from the marks of their agency. But the distribution of the volcanic energy over so wide a space is doubtless the reason that the eruptions of Hecla are far behind those of Etna and Vesuvius, both in frequency and magnitude. Since 1004, only 23 eruptions from Hecla have been recorded, but some of these lasted for a considerable length of time; 8 or 9 eruptions have also taken place within the same period from the Katlaglau, Eyafalla, and Skaptar Jokuls in the immediate vicinity of Hecla; and it is a curious fact, that out of 42 eruptions mentioned by native authors as having occurred in different parts of Iceland since the year 900, 5 were simultaneous, or nearly so, with eruptions of Vesuvius, 4 with those of Etna, and 1 (in 1766) with eruptions of both Etna and Vesuvius. (*Sir G. Mackenzie's Travels in Iceland*, pp. 236-254; *Henderson's Voyages, des Gens du Monde; Lyle's Principals of Geology*.)

HEDON, or HEYDON, a bor., market-town, and par. of England, co. York, E. riding, middle div. of wap. Holderness, on the Breamish, 6 m. E. Hull. Area of par., with which the bor. is co-extensive, 1,440 acres; pop., in 1831, 1,080. The town is small and mean-looking, with little business or trade. It was formerly of greater importance, and its decay is owing to the choking up of its harbour, and the greater advantages enjoyed by the neighbouring port of Hull. A church, dissenting chapel, and charity school are its only public buildings. This inconsiderable place returned 3 mems. to the H. of C., from the lat. of Edward VI. down to the Reform Act, by which it was disfranchised. The franchise was vested in the freemen, who became such by descent, apprenticeship, or gift: the seats were usually sold to the highest bidder.

HEIDELBERG, a city of S. Germany, duch. Baden, and the seat of a town and district bailiwick, at the foot of the Kaiserstuhl on the Neckar, about 12 m. above its confluence with the Rhine at Mannheim, 30 m. N. Carlsruhe, and 48 m. S. Frankfurt-on-Main: lat. 49° 24' 43" N., long. 8° 41' 38" E. Pop., in 1838, 13,430. (*Berg-haus*.) It is picturesquely situated at the entrance of the beautiful winding valley of the Neckar, and overlooked by well-wooded hills at the back, while rich vineyards cover the rising ground as far as the Helligenberg on the opposite side of the river. The town lies close to the bank, and the principal street (*Hauptstrasse*), into which most of the others run, is nearly a mile long. The streets are narrow and gloomy, and the public buildings have no pretensions to grandeur. The church of the Holy Ghost, a large structure with a very lofty steeple, is divided so as to furnish accommodation both for Protestant and Rom. Catholic worship. St. Peter's church is the oldest in the town, and on its doors Jerome of Prague nailed his celebrated theses expounding the doctrines of the Reformers. There are two other churches and a Jews' synagogue. The University-house is a plain building, in a small square near the centre of the town, and contiguous to it is the library. In the same square is the Museum Club, where the members of the University dine, and meet for various purposes. The Anatomical and Zoological Museum, in the suburbs, was formerly a Dominican convent. Connected with the medical school are 3 hospitals, small and ill-ventilated, and not accommodating, in the whole, more than about 50 patients. The river, only navigable here for barges and rafts, is crossed by a stone bridge of 9 arches, 760 ft. long, and 34 ft. broad; and at its foot, within the town, is a heavy-looking building with towers, used as a prison for riotous students and other disorderly persons. The well-known *Schloß*, or electoral palace, stands on the side of the Giesberg, S. of the town, from which its ruins have a most imposing aspect. The castle was sacked and partly burnt by the French in 1693, and afterwards struck by lightning in 1764; since which time it has been wholly uninhabited: it is now roofless, and presents a mass of red-sandstone walls perforated with windows. The styles of architecture partake of all the successive varieties belonging to the 14th, 15th, and 16th centuries. The most ancient part is the E. front, part of which was built in the 14th century by the Elector Otto Henry: it is a solid square building with towers at each end, one low and round, the other higher and of octagonal shape. A more modern part, less injured than the rest, is remarkable for its tall gables, curious pinnacles, and richly ornamented windows, showing it to belong to the 17th century. The front towards the Giesberg is a mere mass of moulder-

The date of the foundation of Heidelberg is not known; but it ranked only as a small town in 1225. The count-palatine, Robert, enlarged it in 1262, and the period reaching thence to the 30 years' war appears to have been the era of its prosperity; for it then displayed, in its handsome buildings, all the splendour arising from a flourishing trade, and the residence of the court of the electors palatine of the Rhine. In 1622, during the 30 years' war, the town was taken by Count Tilly, after a month's siege, and given up to be sacked for three days: the library was sent to the Duke of Bavaria, and the imperial troops retained possession of the place during 11 years, at the end of which it was retaken by the Swedes under Gustavus Adolphus, and kept by them till the peace of Westphalia, in 1648. In 1674, in consequence of disagreements between Louis XIV. and the elector Charles Louis, a French army under Turenne invaded the Palatinate, sacked and setting fire to its towns and villages. The sufferings of Heidelberg at this time, however, bore no comparison to the severe treatment which

it met with in 1689 and 1693, when Melac and Chamilly ravaged and burnt the place. (See *Voltaire, Siècle de Louis XIV.*, ch. 16.) These repeated calamities, and the removal of the elector's residence and court to Mannheim, in 1719, contributed to diminish its importance among the towns of Germany; and it has never since recovered either its trade or pop. In 1802, at the peace of Amiens, Heidelberg was attached to the grand-duchy of Baden.

HEILBRONN, a town of S. Germany, k. of Württemberg, circ. of the Neckar, and near that river, 26 m. N. Stuttgart. Pop. 10,900. It is irregularly laid out, but contains many good houses. The *Dict. Géographique* (1898) says that it is surrounded by lofty walls and a deep ditch; but later authorities do not mention its fortifications. Its most interesting public edifice is the church of St. Kilian, remarkable for the pure Gothic architecture of its choir, and its beautiful tower, built in 1529, 220 ft. high. The town hall is an antique edifice, in which many imperial charters, bulls, and other ancient records are deposited. In the outskirts of the town is a tall square tower, in which Götz of Berlichingen, celebrated in one of Göthe's dramas, was confined in 1526. The house of the Teutonic Knights is now a barrack; on the other hand, the orphan asylum has been converted into a royal residence. There are 3 Rom. Cath. and 2 Protestant churches, a richly endowed hospital, a house of correction, and a gymnasium with a library of 12,000 vols. Heilbronn retained the privileges of a free city of the empire, originally conferred upon it by the Emp. Fred. Barbarossa, down to the beginning of the present century. It was formerly a place of importance, from its position near the frontier of the circles of Swabia, Franconia, and the Lower Rhine. It still has an active trade, being an entrepôt for the merchandise sent from Frankfurt for the supply of S. Germany. It has manufactures of woollen cloth, white lead, tobacco, hats, brandy, paper, oil, gypsum, silver articles, &c.; and some trade in woollen and cotton goods. The *Wilhelms canal*, recently carried into the town, facilitates the traffic between it and the Neckar. Great quantities of wine, some of very tolerable quality, are grown in the neighbourhood, and coal is said to abound in its vicinity.

HELDER (THE), a marit. town of N. Holland, on a projecting point of land at the N. extremity of that prov., opposite the Texel, 40 m. N. by W. Amsterdam: lat. 52° 57' 42" N., long. 4° 44' 55" E. Pop. 2,852. Being important from its position, commanding the Mars-Diep, or channel to the Zuyder Zee, and having almost the only deep water harbour on the coast of Holland, it is strongly fortified. It has a few manufactures, and some trade with Amsterdam, with which city it communicates by the Helder canal, the noblest work of the kind in Holland (*See* AMSTERDAM, p. 100.) The famous Van Tromp was killed in an engagement off the Helder in 1653. It was taken by the British under Sir R. Abercrombie in 1799.

HELENA (ST.). *See* ST. HELENA.

HELLER'S (ST.), the cap. of the Isl. of Jersey on its S. coast, 90 m. S. Portland Bill, 35 m. N.W. Granville, and 39 m. N. St. Malo; lat. 49° 18' N., long. 2° 13' 46" W. Pop. (1881), 10,190. It stands on the E. side of St. Aubin's Bay, on a slope facing the shore between two rocky heights, on one of which is the citadel, Fort Regent, overlooking the harbour. It is not well built, and in the old and central parts the streets are irregular and narrow; but in the outskirts they are regular and well built, with ornamented garden-ground in front. The Royal Square, the chief open space within the town, contains the par. church, built in 1341, the court-house, reading-rooms, and a large hotel. The principal public buildings, besides these, are the theatre, gaol, and two chapels, one being of Gothic architecture. This chapel and the theatre are the only edifices that have any claim to architectural beauty. The market-place is an open square, with tall and iron palisades, and the market on Saturdays presents a magnificent display of vegetables, fruit, and flowers, besides poultry and game from France, all at very moderate prices. Fort Regent, which cost 800,000*fr.*, was erected in 1806, and possesses all the usual defences of a regular fortress; but it has little accommodation for troops, and is said to have been injudiciously planned. Another fortress, Elizabeth Castle, (so called, because it was first built in Queen Elizabeth's reign), stands on a rocky island ½ m. from the shore, which at low water may be reached on foot by means of a long natural causeway; it contains extensive barracks, and appears to be a strong position. Lord Clarendon resided here two years while writing his history of the Rebellion. The harbour of St. Heller's is formed by two piers jutting out into the bay at the S. end of the town. (See JERSEY.) (*Ingle's Channel Islands*, i. 11—30.)

HELIGOLAND or **HELGOLAND** (an. *Hertha*), an island belonging to Great Britain, in the North Sea, 26 m. from the mouths of the Elbe and Weser. Area 54

sq. m. Pop. (1894) 2,931. It is divided into 2 parts, a high cliff and a low plain communicating with each other by a ledge of rocks, on which is cut a flight of 190 steps. The elevated part is about 4,000 paces in circ., a precipitous rock of red conglomerate, varying from 90 to 170 ft. in height, and covered on the top with thin herbage, but without tree or shrub: the lower part is much smaller, and the entire circ. of the island is less than 4 m. The dimensions are continually lessening, owing to the encroachments of the sea, which, in 1770, separated a part of the island, now an uninhabited sandbank. Lyell (*Geol. b. 1. ch. 7.*) attributes its destruction to the collision between the waters of the Elbe and Weser, and the strong ocean-tides of the North Sea. On the summit of the cliffs stands the lighthouse, lat. 54° 11' 34" N., and long. 7° 53' 13" E., maintained from dues paid by British vessels entering the port of Hamburg. The church also, and the batteries, are conspicuous objects from the sea. Since 1821, when the military establishment was broken up, the batteries have been dismantled, and are falling to decay. The church is a plain structure, erected in 1682, the duties of which are performed by a Lutheran clergyman salaried by government, who is likewise the head-master of the free school, which is attended by 320 children. The little town on the cliff consists of about 350 houses, chiefly inhabited by small traders and fishermen. On the lower part of the island are about 70 fishermen's huts, the only remains of the numerous storehouses standing here during the war, when this island was the centre of an extensive contraband trade. (*Convers. Lexicon.*) Heligoland has two good natural harbours, one on the N., the other on its S. side; and E. of it is a roadstead, where vessels may anchor in 48 fathoms. The people, who are of Frisian extraction, and speak a dialect of that language, are chiefly employed in the haddock and lobster fisheries, the produce of which is taken to Hamburg, and exchanged for those necessities which this island does not supply: some thousands of the lobsters come, also, to the London market. The annual value of these fisheries is said (*Dict. Geog.*, art. Heligoland) to average 5,000*l.* a year. Many of the people are excellent pilots, and, being licensed by the island authorities, procure lucrative employment from vessels of all nations entering the Elbe. The females of the pop. are chiefly engaged in raising a little barley and oats on spots where vegetation will thrive, and in tending the few sheep (about 150) that graze on the downs. This dependency, though useless in time of peace, serves in war for a point of observation, and a depot for produce. It costs at present from 85*0*l.** to 900*0*l.** a year.

Heligoland, in ancient times, was the residence of a chief of the Sicambri or N. Frislanders, and was the seat of worship of the Saxon goddess Phoseta, from which circumstance its name (*holty-land*) was derived. It was in the possession of Denmark till 1807, when it was taken by the English, who have since retained it.

HELLESPONT. See DARDANELLES.

HELMSTADT, a town of N.W. Germany, duchy Brunswick, distr. Schönlungen, cap. circle same name, 22 m. E. by S. Brunswick, and 30 m. W. Magdeburg; lat. 51° 12' 40" N. long. 11° 1' 14" E. Pop., in 1834, 6,400. It is an old-fashioned walled town with four gates; and the fortifications are turned into public walks, lined with lime-trees. Its two suburbs are called Osterdorf and Neumark. The places most worthy of note are the principal square, the Lutheran church of St. Stephen, the town-hall, and the circle-tribunal, once the university building. Besides these, there are 2 other churches, 3 hospitals, and an orphan asylum. Near the town, in the forest of Marienburg, are some medicinal springs; and on the Cornetwall, near the Lubbenstein, four enormous altars of Thor and Odin, surrounded with a circle of stones somewhat similar to that seen at Abury, in Wiltshire. It was once the seat of a university, founded by Julius duke of Brunswick in 1575, which was in a most flourishing state, till the establishment of Göttingen university thinned its members. It was suppressed in 1809 by Jerome Bonaparte, and a portion of its library removed to Göttingen. A gymnasium and a normal school are the only existing establishments for education. Helmstadt is the seat of a general superintendency, and a place of considerable trade for its size. Flannels, hats, tobacco-pipes, soap, spirits and liquours are its chief manufactures. It trades with Prussia and has four markets in the year. It is believed to have been originally built by the emperor Charlemagne in 783.

HELESTONE, a parl. bor., market town, and par. of England, co. Cornwall, hund. Kerrier, 242 m. W. by S. London, and 16 m. S.W. Truro. Area of par. 130 acres; pop. of do. (1831) 3,283. The town stands on the side of a hill sloping to the river Loe or Cober, which is here crossed by a bridge. The houses are chiefly ranged along four streets, which cross each other at right angles; it is well paved, lighted with gas, and abundantly supplied with water by streams running through the streets. Near the centre of the town is an ancient town-hall, and there

is a coinage hall, now disused and let for private dwellings. The church (a chapel of ease dependent on the vicarage of Wendron) is a modern structure, on high ground, having a fine pinnacled tower 90 ft. high. The dissenters also have two places of worship, and the Sunday schools are attended by 600 children. The grammar-school, recently revived, has a high character; and there is a good national school. Helestone is the market for an extensive farming district, and also participates in the advantages derived from the mining speculations in the immediate neighbourhood: the mechanics are numerous, especially shoemakers, and the town is on the whole, in a thriving state. Loe Pool, about 1 m. below the town, dries at low water; but facilities have lately been afforded to the trade by sea by the improvement of the harbour of Portleven, about 3 m. distant. Iron, coal, and timber are imported in large quantities, for the use of the neighbouring mines. A singular custom prevails here, called the Furrey-dance, a kind of joyous procession, celebrated May 8, which is always observed as a holiday. The town received its first charter from King John; and Edward I. made it a coinage town, with the privilege of sending 2 mews to the H. of C. The governing charter of the corporation, previously to the Municipal Reform Act, was granted in 1774. The last mentioned act vested the government in 4 aldermen and 12 councillors. Corp. rev., in 1839, 82*4*l.** Previously to the Reform Act, the elective franchise was vested in the freemen, elected by the mayor and aldermen; but it had been for many years a mere nomination bor. belonging to the Duke of Leeds. The Boundary Act added to the old bor. the entire par. of Sithney, which had, in 1831, a pop. of 2,772, and a large portion of the par. of Wendron; so that the pop. of the parl. bor. may be estimated at from 7,000 to 8,000. Registered electors, in 1838-39, 365. Markets on Wednesdays and Saturdays; fairs on the Saturdays before Mid-Whitsunday and Palm Sunday, and on Whit-Monday, July 20., Sept. 9. Oct. 28. and the first three Saturdays in December. (*Potwhell's Cornwall; Parl. Rep.*)

HELVOETSLUYDS, or HELLEVOETSLUIS, a fortified town and port of Holland, prov. S. Holland, on the Haring-vliet, the largest mouth of the Rhine, 16 m. S.W. by W. Rotterdam. Pop. 1,644. Its excellent harbour, capable of accommodating the whole Dutch navy, runs through the centre of the town, and, being bounded by a pier on either side, extends a considerable way into the river; it has also a large arsenal, and docks for the construction and repair of ships of war, and a naval school. It used to be the regular station for the English and Dutch packet-boats, which sailed to and from Harwich twice a week, till the adoption of steam-packets for the conveyance of the English mail to Rotterdam, in 1823. Our great deliverer William III. embarked at Helvoetsluis for England in 1688. (*De Cloet; Dict. Geog.*, &c.)

HEMEL-HEMPSTED, a market town and par. of England, co. Hertford, hund. Dacorum, 22 m. N.W. London, and 16 m. W. Hertford. Area of par. 7,310 acres. Pop. (1831), 4,759. The dependent chapelry of Bovingdon and Flansham have also an area of 5,130 acres; and a pop., in 1831, of 1,278. The town stands on the slope of a hill, close to the small river Gade, and consists of a main street, lined with tolerably good houses. The church, in a spacious churchyard, is cruciform, with an embattled tower surmounted by a high octagonal steeple: the architecture was originally Norman, and the W. door is considered by Dallaway one of the finest specimens in England: many alterations and enlargements have, however, been made at subsequent periods, which greatly diminish the beauty of the edifice. The town-hall, the only other public edifice, is a long narrow building, with an open space underneath for the accommodation of the farmers, who bring thither large quantities of corn for sale on Thursday, the market-day. Within the par. are 2 endowed free schools, one for 13 boys, the other for 15 girls; besides which there are 2 infant schools, 2 national schools, and 2 schools of industry, altogether attended by upwards of 200 children: the Sunday schools have nearly 300 scholars. The chief employment of the female part of the pop. is straw plaiting, and this art is taught to about 280 children, in 24 dame-schools. In the neighbourhood are some of the largest and most perfect paper-mills in the empire; and within 4 m. of the town there are numerous flour-mills. The Grand Junction Canal and Birmingham Railway are 1½ m. S.W. and greatly contribute to increase the traffic of the place, by the facility they afford for the transit of corn and other agricultural produce. Hemel-Hempstead was incorporated by Henry VIII., and the inhab. are empowered to have a bailiff, and to hold courts of pie-poudre during fairs and markets. This corporation, however, is mentioned neither in the commissioners' report, nor in the schedules of the Municipal Reform Act.

Markets on Thursday: fair for sheep, Holy Thursday; statute-fair on Monday in September.

HENLEY-ON-THAMES, a market town, mun.

bor., and par. of England, co. Oxford, hund. Binsfield, on the W. bank of the Thames, 23 m. S.E. Oxford, 35 m. W. London. Area of par. 1,980 acres; pop. of dist., in 1881, 3,618. The town is beautifully situated at the foot of the Chiltern range, which is here well covered with beech and other forest timber. The E. entrance is by a handsome stone bridge, of 5 arches, built in 1786; and the first object presenting itself to the view on entering from London, is the church, a handsome, though irregular Gothic structure, built at different times, and having a lofty tower, ornamented at the angles with taper octagonal turrets, rising to considerable height above the battlements. It contains some curious monuments, and a library bequeathed by Dean Aldrich in 1787. The High Street, which runs W. from the bridge, is wide, well paved, and lighted, and lined with good houses: at its further end, on the rise of a hill, stands the town-hall, a neat building, on pillars, having on the upper story a hall, council chamber, and other rooms; its lower part, which is open, being used as a market-house. Crossing the High Street at right angles are two other streets, much narrower, and lined with inferior houses. There are places of worship for Independents and Wesleyan Methodists, some almshouses endowed by Longland, Bishop of Lincoln, and several schools. The principal of the latter are the "United Charity Schools," founded in 1604, and endowed with land, realising 870*l.* yearly: the establishment, as revived in 1774, consists of an upper school, in which 25 boys receive class instruction, and a lower school, which provides 60 boys with a plain education, and 20 out of that number with clothing: besides this school, which is by no means in a thriving condition, there is a national school, attended by 124 boys and 72 girls; an infant school, with 160 children; and three Sunday schools. A savings' bank was established in 1817. The chief industry of Henley is malting, but the trade has much declined of late years; and the town can scarcely be said to possess any peculiar manufacture at the present time. It is a corp. town, its governing charter being granted in 1722, having a recorder, 10 aldermen (one of whom is mayor), and 16 burghesses. In consequence of the statement made by the commissioners, that it may be questionable whether any considerable advantage can be derived from a municipal institution in so small a community, especially as the income of the corp. is too limited to enable them to do anything material for the improvement of the town" (*Mun. Corp. Rep.*), this bor. was left untouched by the Municipal Reform Act. The members of the corp. have the patronage of various local charities; but the income at their disposal amounts only to about 70*l.* yearly. Quarter sessions and a court for the recovery of small debts are held here. Markets on Thursday, for corn and other grain: fairs, March 7, Holy Thursday, Thursday in Trinity week, and the Thursday after Sept. 21, chiefly for horses, cattle, and sheep. (*Engl. Encycl. & Dict. Pers.*)

HERACLEA PONTICA, also called PERINTHUS, a famous marit. city of antiquity, now called *Erkki*, on the N. coast of Asia Minor, on the Euxine Sea; lat. 41° 16' N., long. 31° 30' E. Heraclea, says Major Rennell, "has filled the page of history with its grandeur and misfortunes; and its remains testify its former importance." Diodorus Siculus describes it as situated on an elevated neck of land about one stadium in length, the houses thickly set, and conspicuous for their height, out-topping one another, so as to give it the appearance of an amphitheatre. This is exactly the appearance that it exhibits at the present day: and the harbour, though neglected, is magnificent, forming a roadstead like a horse-shoe. The walls are now in a ruinous condition, and constructed chiefly of the remains of a former rampart. In the part fronting the sea, where are the remains both of an inner and an outer wall, huge blocks of basalt and limestone are piled one on another and intermingled with columns and fragments of Byzantine cornices with Christian inscriptions. The castle upon the height is in ruins. Only a part of the ancient city was contained within the wall, the outer portion extending, in the form of a triangle, to a small river-valley, in which was formerly a harbour defended by two towers. The modern town comprises 5 mosques, 2 khans, 2 public baths, and about 300 houses, 50 of which belong to Greek Christians and the rest to Mahomedans. According to the *Dict. Géog.*, it manufactures linen cloth, and exports flax, silk, wax, and timber, importing coffee, sugar, rice, tobacco, and iron.

The ancient Heraclea, founded by the Megareans, early attained to considerable wealth and importance as a place of trade. The inhab. maintained their independence for several years, subject only to a tribute paid to the Persian monarch. The Heracleots supplied the 10,000 Greeks, under Xenophon, on their memorable retreat, with vessels to carry them back to Cyzicus. The republican government was overthrown, about 380 B.C., by Clearchus, one of the chief citizens, in whose family the government continued nearly a century. Heracles furnished succours to Ptolemy against Antigonus;

and afterwards, notwithstanding the aid furnished to Rome by its marine, and a treaty of alliance, both offensive and defensive, with that powerful state, it was pillaged by Cotta, under the pretext that it had resisted the exactions of the publicans (or tax-farmers) of Rome. Its splendid library, temple, and public baths were plundered and set on fire, and many of the inhab. put to death by the conqueror. The city, however, continued to flourish under the Roman emperors, and coins of Trajan and Severus are extant, in which it is styled *metropolis* and *augusta*. The fleet of the Goths waited here for the return of the second expedition that, in the time of Gallienus, ravaged Bithynia and Mysia; and it is mentioned as still prosperous even so recently as the reign of Manuel Comnenus. Athenæus informs us that it was celebrated for its wine, almonds, and nuts. (*Tournefort*, ii.; *Walsh's Constant.* 101.; *Géog. Journ.* ix.; *Dict. Géog.*)

HERAT, or HERAUT, formerly *Heri* (an. *Aria* or *Ariacana*), a city of W. Caubul, in antiquity the cap. of Ariana, and one of the most renowned cities of the E., and still the largest and most populous town of the modern prov. of Khorassan, and the cap. of an independent chieftship. It stands on the Herirood (an. *Arius*), in a fertile plain, 380 m. W. by N. Caubul, 270 m. N.W. Candahar, 410 m. N.E. Yazd, and 410 m. S.S.W. Bukhara; lat. 34° 50' N., long. 62° 27' E. Pop. estimated some years since by Christie at 400,000; but at present it does not probably exceed 45,000. (*Edinburgh, Conolly*, &c.) of whom 3-4ths are native inhab.; about 1-10th part Dooranee Afghans, and the rest Moguls, Elmauks, Hindoo merchants, Jews, and other strangers. Previously to 1824, when the city was besieged by the Candahar troops, it covered a large extent of ground, having had some considerable suburbs outside the walls. It now consists of only the fortified town, 3-4ths of a m. square, surrounded with lofty walls of unburnt brick, erected upon a solid mound formed by the earth of a broad wet ditch, which goes entirely round the city, and is filled by springs within itself. There are 5 gates, each defended by a small outwork; and on the N. side of the fortress, a small citadel, a square of burnt bricks, flanked with towers at the angles, and, like the town itself, built on a mound enclosed by a wet ditch. The interior of Herat is divided into quarters by 4 long bazaars, covered with arched brick, which run from 4 of the gates, and meet in a small domed quadrangle in the centre of the city. (*Conolly*.) It is said to have about 4,000 dwelling-houses, 1,200 shops, 17 caravanseras, and 20 baths, besides many mosques, and fine public reservoirs. But, notwithstanding a plentiful supply of water, and abundant means for insuring cleanliness, Herat is one of the dirtiest places in the E. "Many of the small streets which branch from the main ones are left over, and form low dark tunnels, containing every offensive thing. No drains having been contrived to carry off the rain, which falls within the walls, it collects and stagnates in ponds, which are dug in different parts of the city. The residents cast out the refuse of their houses into the streets, and dead cats and dogs are commonly seen lying upon heaps of the vilest filth. *Ruum ust*—'it is the custom'—was the only apology I heard from those even who admitted the evil." (*Conolly*, ii. 3, 4.) The residence of the prince is a mean building, standing before an open square, in the centre of which is the gallows and the great mosque. The latter, a lofty and spacious edifice, supposed to date from the 12th century, surmounted with elegant domes and minarets, and ornamented with shining painted tile, is going to decay. "But though the city of Herat," says Conolly, "be as I have described it, without the walls all is beauty. The town is 4 m. distant from hills on the N., and 12 from those which run S. of it. The space between the hills is one beautiful extent of little fortified villages, gardens, vineyards, and cornfields. A *bund* is thrown across the Herirood; and its waters, being turned into many canals, are so conducted over the vale of Herat, that every part of it is watered. The most delicious fruits are grown in the valley; the necessities of life are plentiful and cheap; and the bread and water of Herat are proverbial for their excellence." (*Id.* ib. 4, 5.) Herat, from its extensive trade, has acquired the appellation of *bundar*, or emporium, it being a grand centre of the commerce between Caubul, Cashmere, Bokhara, Hindostan, and Persia. From the N., E., and S., the chief goods received are shawls, indigo, sugar, chintz, muslins, leather, and Tartary skins, which are exported to Meshed, Yazd, Kerman, Isfahan, and Tehran; whence dollars, tea, china-ware, broad cloth, copper, pepper, and sugar candy, dates and shawls from Kerman, and carpets from Ghazn, are imported. The staple commodities of Herat are saffron and *assafetida* silk is obtainable in the neighbourhood, but not in sufficient quantity for commerce. Many lamb and sheep skins are made up into caps and cloaks, and when Conolly visited the city, there were in it more than 150 shoemakers' shops. The latter were, however, inadequate to supply the demand of the prov., and many camel loads of sup-

pers were brought from Candahar. The carpets of Herat are in great repute for their softness, and brilliancy of colour; but the trade in them has declined of late years. The greatest capitalists here are the Hindoo merchants. A mile N. of the town are the remains of what anciently was the wall of Herat, not far from which are the magnificent ruins of a place of worship, built by a descendant of Timour. The princes of his house constructed several palaces, gardens, and cemeteries on the hill range N. of Herat, traces of which still exist. Herat is capable of being made a place of great strength. An army might be garrisoned in it for years with every necessary immediately within its reach; and the influence of any W. power in possession of this fortress would be felt over all the country E., as far at least as Candahar. It long formed the cap. of an extensive empire transmitted by Timour or Tamerlane to his sons. It thence passed under the rule of Persia; was taken in 1715 by the Dooranee Afghans; in 1731, by Nadir Shah; and retaken by the Afghans, under Ahmed Shah, in 1749. Since then, the Persians have often attacked it unsuccessfully; on the last occasion, in 1838, they were routed under its walls.

The territory of Herat, subject to Kamraun Shah (see AFFGHANISTAN), extends N. perhaps to the Moorghaut, and S.E. the greater part of the way to Candahar; but W. for about 30 m. only. The money revenue derived from the city and its neighbourhood, in 1831, was rated at about 21,500*l.*; that of the prov. was estimated at four times as much; besides which, a large quantity of agricultural and other produce was exacted by the sovereign. (Conolly's *Overland Journey to India*; *Elphinstone's Cavalry*; *Burnes*, &c.)

HERAULT, a marit. d^{ép.} of France, in the S. part of the kingdom, formerly a part of the prov. of Languedoc, between lat. 43° 18' and 43° 57' N., and long. 2° 33' and 4° 18' E.; having N.W. the d^{éps.} Tarn and Aveyron, S.W. Aude, N.E. Gard, and S.E. and S. the Méditerranée. Length, N.E. to S.W., 73 m.; average breadth, about 30 m. Area, 524,302 hectares. Pop. (1836), 357,546. The slope of this d^{ép.} is from N.W. to S.E., and most of its rivers run in this direction; but the Hérault, from which it derives its name, has mostly a S.W. course from the d^{ép.} Gard, in which it rises, to its mouth in the Méditerranée, 15 m. S.W. Cette. Its total length is about 81 leagues, 34 of which are navigable. A long succession of lagoons, occupying an area of more than 40,000 hectares, lines the coast, on which there are several good ports, including those of Agde and Cette. The climate, though hot and dry, is generally healthy: the soil is mostly calcareous. In 1834, 186,566 hectares were arable, and 8,637 in pasture; vineyards occupied 108,638 hect., woods 77,644 hect., and heaths, wastes, &c. upwards of 214,000 hect. The growth of wine is the principal branch of industry. About 2,080,000 hectol. are made annually, 400,000 h. of which are exported, and a similar quantity used for home consumption; the rest is converted into brandy. The best kinds are the red wines of St. George and Virargues, and the white wines of Frontignan and Lunel. Corn, which is chiefly wheat, with some oats and rye, is not grown in sufficient quantity for home consumption; the annual produce is about 600,000 hectol. Oil, olives, figs, and dried fruits form important articles of commerce. In 1834, there were 227,000 mulberry-trees in the d^{ép.}, and in 1835, 373,390 kilog. of silk cocoons were obtained. Bees are largely reared; and wax to the value of nearly a million of francs is annually exported. In 1830, there were 534,000 sheep in the d^{ép.}; their flesh is excellent, and they yield about 1,200,000 kilog. of wool yearly. In 1835, of 115,048 properties subject to the *contribution foncière*, 45,842 were assessed at less than 5 fr., and 19,420 at from 5 to 10 fr.: the number of large properties is greatly above the average of the d^{éps.} The pichard and other fisheries in the Méditerranée and the lagoons, employ a great many hands; and it is estimated that 75,000 quintals of fish are annually taken, worth 545,000 fr. Hérault is rich in mineral products; iron, copper, and coal mines, and quarries of marble, alabaster, gypsum, granite, &c. are wrought. The principal manufactures are those of woollen cloths, silk and cotton fabrics, of which Montpellier is the chief seat: there are others of paper, chemical products, perfumery, and liqueurs many distilleries and dyeing establishments, and a good deal of salt is made in the marshes. Hérault is, however, much more an agricultural and commercial, than a manufacturing d^{ép.} Montpellier, Cette, and Agde have extensive trade, and their intercourse with the interior is promoted by several navigable canals, of which the *Canal du Midi* is the chief. Hérault is divided into 4 arrondis.; chief towns, Montpellier, Beziers, Lodève, and St. Pons. It sends 6 mems. to the ch. of d^{ép.} No. of electors (1838-39), 3,609. Total public revenue (1831), 12,312,819 fr. This d^{ép.} anciently formed a part of Narbonnese Gaul, and contains many Celtic and Roman antiquities, and some which are probably of a Greek origin. (Hugo, art. *Hérault*; *French Official Tables*, &c.)

HERCULANEUM, or HERCULANUM (*Cic. ad Att.* vii. 8.), an ancient and now buried city of Campania in Italy, close to the Bay of Naples, and 8 m. S.E. that city. The date of its foundation is unknown, and its early history fabulous; but there is little doubt that it was held by Oscii, Pelasgi, and Samnites, before it came into the possession of the Romans. Velleius Paterculus tells us that its inhab. took an active part in the social and civil wars, and that the city suffered considerably in consequence. Little more is known about it except its destruction with Pompeii and Stabiae, by an eruption of Mount Vesuvius. The volcano had for some centuries been inactive, and even covered with verdure; but in the first year of the reign of Titus, A.D. 79, it burst forth with great violence, and caused those terrible disasters so well described by the younger Pliny, in two entire epistles (vi. 16. and 20.), and more briefly by Tacitus: — "*Lucium autem atrox et continuus terror terra, quem secuta est horrenda Vesuvii montis conflagratio. Pulcherrima Campaniae ora miserè fœdata: obruta duæ urbes Herculanum et Pompeii: vasta hominum strages, quos inter perire Agrippa ejusque mater Drusilla. At studiosior famâ mors C. Plinii fuit insignior.*" (*App. Chron.*) Martial alludes also to the fate of Herculaneum: —

"His loca Herculeo nomine clausæ erant:
Cuncta jacent flammis et tristi mœra fœvillæ."

Epigr. iv. 42.

The city appears to have been completely buried under showers of ashes, over which a stream of lava flowed, and afterwards hardened. The figure of the coast itself was altered by the burning torrent; and thus, when the local features were so wholly changed, all knowledge of the city, beyond its name, was soon lost. After a concealment of more than sixteen centuries, accident led to the discovery of its ruins. In 1713 the Prince d'Elbeuf, a French nobleman, who was building a palace at Portici, having need of materials for stucco, procured large quantities of marble and terra cotta from the sinking of a wall on his estate. As the sinking proceeded, the workmen, when about 76 ft. below the surface, came to fragments of statues; and the prince then ordered excavations to be made, with the view of ascertaining the extent of the remains. A vault, a marble door-way, and several statues of vestals, were disclosed with little labour; but the works were soon afterwards stopped by the jealousy of the court of Naples. Twenty-five years after, on the accession of Don Carlos, the Infanta of Spain, to the throne of Naples, the works were resumed on a grander scale, and a theatre, chalcidicum, two temples, and villa, were successively discovered and exhumed. Owing, however, to the clumsy manner in which the mining was conducted, discreditable alike to the engineer and the government employing him, the statues and columns were needlessly injured and demolished, and, strange to say, the earth, instead of being brought to the surface, was used to fill up one part as another was searched. In consequence of this procedure, a small portion of the theatre is all that is now accessible; and the works, together with the interest excited by them among the Neapolitans, have long been discontinued. The whole extent of the ground explored was about 600 yards from N.W. to S.E., by 300 yards in breadth. The largest street was the N.E. limit, beyond which it was supposed the mining could not be carried without endangering the town of Resina. Parallel with it was another street, and three others cut them at right angles. These streets appear to have been paved with lava, like those of modern Naples, a fact which proves that there must have been an eruption of Vesuvius prior to that which overwhelmed the city. The theatre was situated at the N. end of the town, which is supposed by Winkelmann to have extended nearly 2 m. along the shore, but without any great breadth. The theatre appears, from an inscription on its architraves, to have been built by Memmius, and its dimensions are as follow: — External circumference, 290 ft. Internal ditto as far as stage, 230 ft.; internal diameter, 160 ft.; width of stage, 7 ft.; height, not known.

There were 18 rows of benches, besides 3 above the portico; and the entrance to them was by *comitoria* or passages leading from the three tiers of arched corridors which ran round the building, and communicated by steps with the exterior. Its walls were cased with polished marble; both inside and outside beautiful statues and highly wrought columns were found. The floor was composed of thick squares of yellow marble, many of which still remained when Winkelmann examined the place. The theatre is supposed to have been capable of accommodating 3,000 spectators, and was therefore very much smaller than many others, the ruins of which are still extant. In the chief street, which is 36 ft. wide, having a raised foot-way on either side with portions of columns showing the existence of an old colonnade, are the remains of a forum, or *chalcidicum*, and of two temples. The forum is an oblong building, 328 ft. long and 132 ft. broad, with a colonnade of 42 pillars running

round its exterior; and it had 5 entrances, 3 in front; formed by 4 great pilasters decorated with equestrian statues, and 2 smaller entrances at the sides. The building was all cased with marble except under the colonnade, where the walls are covered with frescoes. One of the equestrian statues formerly at the front entrance has been restored, and is reckoned quite a *chef-d'œuvre* of ancient art. The two temples are united under a single roof, and the entire length of both is 192 ft., and the breadth 60 ft. They are very unequal in size; but are highly ornamented internally with columns, frescoes, and inscriptions. Among the private buildings excavated, all of which were small, with only one story, was a suburban villa most profusely decorated with statues and fresco paintings. It seems to have been extensive, having rooms extending along the side of the garden; but they are all on the same story. Here were found the celebrated papyrus, upwards of 680 in number, the unrolling of which has given so much trouble to the learned, and which would appear to be little better than thrown away, if the value of the 400 already unrolled and partly published may be taken as any criterion of the value of the others. The subjects are very various; but the works and their authors are alike uninteresting. (*Phil. Transac.* for 1785; *Sir E. Dineley's Report in the Journal of the Royal Institution for April, 1819.*) Close to this villa a large tank, or piscina, was discovered, 250 ft. long and 27 ft. broad, with semi-circular ends, and enclosed by a balustrade on which were ranged many exquisitely wrought bronze figures, now in the private apartments of the Queen of Naples. The ornamental beds and arrangements of the garden were still discoverable, and at its extremity towards the sea was a pavilion floored with African marble and *jaune antique*. The precious relics of antiquity, so far as they were capable of removal, were taken to Naples, and are now deposited, with the other relics from Pompeii, in a large museum in a wing of the king's palace. The collection is most extensive, and comprises not only frescoes, statues, and works of art, but also articles of household furniture, such as tripods, chandeliers, lamps, basins, paterae, mirrors, articles of the toilet, musical and surgical instruments, and even cooking utensils. Engravings and descriptions of them will be found in David and Marchal's *Antiquités d'Herculanum*, 12 vols. 4to., and also in that instructive little work, "*Pompeii*," in the *Library of Entert. Knowledge*. The paintings which have been cut from the walls on which they were originally executed have, since their restoration to the light, lost somewhat of their brightness; but the colours are still wonderfully fresh. Their merit of course varies extremely, and many are incorrect in drawing; but the vigour, of the touches by which some of the figures are expressed, and the graceful elegance of the attitudes selected by the painter are truly astonishing. The most beautiful of these were taken from the walls of the theatre at Herculanum, and the subjects may be understood at a glance, by those acquainted with Grecian history and mythology. Among the statues, the palm is generally given to a Mercury and a drunken Faun; but there are many, of bronze as well as marble, of most exquisite beauty; both the statues and busts are very numerous. In the collection of medals, a gold medal of Sicily, struck in the 15th year of the reign of Augustus, is considered by virtuosi to be the most rare and curious. On the whole, the remains of Herculanum, so varied and perfect, throw a light on the arts and domestic customs of the Romans, which no mere description by a classic author could give. Antiquity here seems to revive, and we are carried back to the days when Rome was the mistress of the world. (*Encyc. Metrop. art. Herculanum*, by Rev. G. G. Renoussin; *Winkelmänn's Letters on Herculanum*, passim; *Gell's Pompeii*; *Moore's Italy*, &c.)

HEREFORD, an inland co. of England, on the borders of Wales, having N. the co. Salop, E. Worcester and Gloucester, S. the latter and Monmouth, and W. Brecknock and Radnor. Area, 653,330 acres, of which about 500,000 are arable, meadow, and pasture. The aspect of this co. is every where rich and beautiful; the surface is finely diversified with gentle eminences and valleys, magnificent woods, orchards, and meadows, enclosed with hedges and rows of trees. It is usually represented as being every where remarkable for fertility; but it has probably been in this respect overrated, and though the soil in many districts is not surpassed by any in the kingdom, it has, notwithstanding, a considerable extent of inferior land. It produces excellent crops of wheat and barley, and is one of the principal cyder cos. Its wool is also esteemed equal, if not superior, to any produced elsewhere in England. The Hereford breed of cattle are deservedly held in high estimation; they are of a dark red colour, with white faces, throats, and bellies, and fatten easily; are excellent workers, and are remarkably quiet and docile; but as respects the dairy, they are good for nothing. Nearly half the field labour of the co. is performed by the cattle.

The wool of the Ryland sheep, formerly so celebrated for its fineness, has been injured by crossing by the Leicesters; but the carcass of the animal has been, in consequence, materially improved, and the weight of the fleece increased. Agriculture is in a pretty advanced state in this co., but there is a great want of drainage. Turnips are pretty extensively cultivated; and a vast improvement has been effected in many districts by means of irrigation. Hops are largely grown, particularly on the borders of Worcestershire, from 12,000 to 13,500 acres being under this crop. Property very variously divided: there are a few large estates, with many of a medium, and some of a small size. The tenures of gavelkind and bor. English exist in some districts, but are usually nullified by will. The farms, which are mostly large, are usually held from year to year. All the more modern farm buildings are of brick, and slated, those of older date being principally thatched. Average rent of land, in 1810, 16s. 5d. an acre. Oak bark is an important product. Iron ore has been discovered, but it is not wrought; and the other minerals seem to be of no importance. If we except cyder, which is produced to a greater extent here than in any other county, manufactures are inconsiderable; gloves, however, are made at Hereford and Leominster, and some coarse woollens in a few places. Principal rivers, the Wye, Lug, and Munnow. The Wye is navigable to Hereford for barges carrying from 18 to 20 tons, but the navigation is difficult, and but little to be depended on. Hereford is divided into 11 hundreds, and 219 parishes; it sends 7 mems. to the H. of C., viz. 3 for the co. and 2 each for the bors. of Hereford and Leominster. Registered electors for the co., in 1838-39, 7,322. In 1831, Hereford had 21,907 inhab. houses, 23,565 families, and 111,211 inhab., of whom 55,538 were males, and 55,373 females. Sum expended on the relief of the poor, in 1838-39, 40,389s. Annual value of real property, in 1815, 629,156s.; profits of trade and professions in ditto, 61,851s.

HEREFORD, a city and parl. bor. of England, co. same name, of which it is the cap. hunc. Grimworch, on the N. bank of the Wye, 118 m. W.N.W. London, and 56 m. S.W. Birmingham. It stands on a gravelly soil, in a valley, near the centre of the co. The parl. bor., which is co-extensive with the old mun. bor., comprises the entire pars. of All Saints, St. Peter's, St. Owen's, St. Nicholas, with parts of St. Martin's and St. John the Baptist, exclusive of out-townships; and had, in 1831, a pop. of 10,194. It extends about $\frac{3}{4}$ m. from N. to S., and nearly 4 m. from E. to W., enclosing an area of about 2,220 acres. The new municipal borough excludes about 2-5ths (chiefly rural tracts) of the above district. The streets are wide, straight, macadamised, flagged, and well lighted with gas. The private dwellings, almost entirely of brick, are generally old-fashioned, some few only being of modern construction. Among the many public edifices, the largest is the cathedral, founded in 825, and rebuilt in 1072. It is a cruciform structure of the Saxon and early Norman style, and at the points of intersection rises a fine square tower 100 ft. high. The uniformity of the building, however, is greatly impaired by the erection of a new and very plain W. end, and render necessary by the fall of the tower and a part of the nave in 1786. The extreme length of the cathedral is 350 ft., length of the great transept 100 ft., breadth of nave and side aisles 74 ft., height of nave 63 ft., height of entire building 91 ft. The nave is divided from the aisles by two rows of massive columns, sustaining semicircular arches, over which are rows of arcades with pointed arches. At the E. end are the Lady Chapel, an octagonal chapter house, and a well-stocked and valuable library. The N. porch is generally admired as a specimen of the romantic Gothic style. Within the church are many fine monuments, among which that of Bishop Cantelupo (who died in 1287) is beautifully ornamented with the most delicate sculpture. Adjoining the cathedral are the college and bishop's palace, in the former of which are apartments for the vicars and other officers of the establishment. The cloisters connecting the palace with the church are considered curious and handsome. A triennial musical festival takes place within the cathedral, the profits of which are given to charitable institutions within the county. A side chapel is used as the parish church of St. John Baptist, the living of which is held under the dean and chapter. Of the 14 parish churches, that of All Saints, which is united with St. Martin's, has a tall and well-proportioned steeple, but is otherwise uninteresting. St. Peter's, which is united with St. Owen's, is a plain building, with a spire. The church of St. Nicholas is old-fashioned and uninteresting; the rectory is in the gift of the crown. The dissenting places of worship belong to Wesleyan Methodists, Independents, Quakers, and R. Catholics, the last of whom have lately built an extremely handsome chapel. Numerous day and Sunday schools are connected both with the churches and chapels; and there is a good charity school for clothing and educating 30 boys and 30 girls. The free grammar-school, locally known as the College

School, was either founded or enlarged by Q. Elizabeth; but it appears to have fallen into disuse, and to be now almost useless, notwithstanding the 20 exhibitions which it offers to the universities of Oxford and Cambridge: connected with this school is Dean Langford's charity, which clothes and educates four children, and sends them to Brasenose College, Oxford, with scholarships of 35*l.* per annum for four years. Among the numerous and richly endowed charities of Hereford, the principal are, 1. St. Ethelbert's Hospital for 10 aged persons, having an income of 160*l.* yearly. 2. Coningsby's Hospital, founded in 1625, on the site of an ancient monastery, and providing lodging, clothing, and 1*l.* a year each to 14 old soldiers, and a salary of 20*l.* for a chaplain. 3. Lazarus's Hospital, once used for lepers and others afflicted with contagious diseases, but now an almshouse for six poor women, who divide 19*l.* yearly. 4. St. Giles's Hospital, established in 1290, as a monastery of Grey Friars, and given by Richard I. to the corporation, by which it was formed into an almshouse for five poor men, who are clothed, and share 80*l.* yearly. 5. William's Hospital, providing six decayed tradesmen with good lodgings, and 3*l.* 10*s.* each per month, and a chaplain, at a salary of 20*l.*, who also officiates in the last-mentioned hospital. 6. Price's Hospital, for 12 men, who are lodged and paid 2*l.* a month each. 7. Trinity Hospital, a handsome brick building, in which 16 poor people are lodged, clothed, and pensioned, at 5*s.* each per week. The last five of these charities are in the patronage of the corporation, who, according to the statement of the municipal commissioners, formerly used their influence for the most corrupt purposes. Many other minor endowments belong both to the corporation and the parishes: indeed few cities in England possess so many charitable trusts as Hereford. (*Charity Comm.*, 32*d* Rep.) A large infirmary, supported by subscriptions and benefactions, and containing accommodation for 70 patients, stands S.E. of the city, near the Castle Green. The union workhouse, completed in 1834, stands on the N.E. side, outside the city. The chief public buildings not yet noticed are the shire-hall, designed by Sir R. Smirke, having a fine Doric portico; the town-hall, an old-fashioned wood and plaster building, supported on pillars forming an arcade, in which is held the vegetable market; the guildhall, built of brick; the theatre; the co. gaol, a well-arranged prison, in which the silent system, and hard labour, are rigorously enforced; and the town gaol, which is very small, and wholly insufficient for the wants of the city. (*Gaul Returns*, 1839, p. 68.) "Hereford, in point of trading prosperity, is in a stationary condition. Though the principal streets contain many good dwelling-houses and shops, there are no evidences of any very active or thriving establishments. It produces no staple commodity; and the glove trade, formerly considerable, has declined. There are some manufactures of hats and cutlery; and the trade in cider, hops, oak-bark, wool, and agricultural produce is somewhat on the increase. The Wye is navigable by barges up to the city, except in dry summers or during heavy floods; and about 10 years ago, a railroad was carried from Hereford to Pontrilas, and thence to Abergavenny; this, among other advantages, secures a steady supply of coal, the price of which has fallen nearly one third." (*Mun. Board Rep.*)

Hereford received its first charter of incorporation in 1180, from Richard I., but the governing charter, previously to the Municipal Reform Act, was granted by William III., in 1697. The corporation now comprises a mayor, 6 aldermen, and 18 councillors: the city is divided into three wards. Corp. rev., in 1839, 2,887*l.* Hereford has sent 2 mems. to the H. of C. since the 23 Edward I., the franchise, previously to the Reform Act, being vested in freemen, resident or non-resident, who became so by birth, marriage, apprenticeship, gift, or purchase. Reg. electors, in 1839, 200. Quarter and petty sessions, and mayor's court, for the recovery of debts, are held within the city. The local acts are 14 Geo. III. c. 38, and 56 Geo. III. c. 33. Market-days on Wed. and Sat., the Wed. after St. Andrew's day being the "great market." Fairs first Tuesday after Feb. 2, and Oct. 2, for cattle, cheese, and farming produce, being among the largest in England. Cattle fairs are also held on Wed. in Easter week, and July 1. The May fair, called the bishop's fair, lasts nine days, and, being a mere holiday fair, is much complained of as a hindrance to business.

During the disputes between Henry III. and his barons, and in the wars of York and Lancaster, Hereford was repeatedly the seat of hostilities; and its fine castle and strong walls, according to Leland, were so much injured, that in the time of Henry VIII. they were going fast to ruin. During the parliamentary wars it was garrisoned by Charles I., and twice besieged: in 1643 it surrendered to the par. troops under Sir W. Waller, and being retaken by the royalists, was nearly the last that opened its gates to the parliament. The ancient fortifications and castle are wholly destroyed, and their site is now occupied by a public promenade, maintained by sub-

scription, and forming the favourite resort of the pop. (*Price's Hist. of Hereford; Britton's Acc. of Her. Cathedral; Mun. Board, and Char. Com. Reports.*)

HERFORD or HERVORDEN, a town of the Prussian dom. prov. Westphalia, gov. Minden, cap. circ. of the same name, on the Werra, 15 m. S.W. Minden. Pop. (1838) 6,852. It has courts of justice for the circle and district, a large prison, a gymnasium, and R. Cath. high school, and manufactures of cotton cloth and yarn, leather, tobacco, and linen goods. The central museum of arts, antiquities, and manufactures for Westphalia is established at Herford.

HERISAU, a town of Switzerland, cant. Appenzell, div. Outer Rhodes, of which it is the cap. jointly with Trojen, these towns being alternately the seat of the legislature. It stands on a height, at the junction of two small streams, which turn the machinery of numerous factories, 5 m. W.N.W. Appenzell. Pop. 2,200, or, with its commune, about 7,000, who are among the most industrious inhab. of the canton. The principal manufactures are those of cottons and silks, the last of recent introduction. It has an ancient church, in which the archives of the Outer Rhodes are kept, a pretty large public library, orphan asylum, court of justice, arsenal, &c. Near it is the Heinrichsbad, one of the most frequented watering-places in E. Switzerland. (*Blisch, Kanton Appenz.*; *Pict.*, &c.)

HERMANSTADT (Hung. *Nagy-Szeben*), a town of Transylvania, cap. of the Saxon land, in an extensive and fertile plain, on the Tlbin, a branch of the Aluta, 71 m. S.S.E. Clausenburg, and 70 m. W. Cronstadt. Pop., in 1838, 18,337. (*Berghaus*.) It partly stands on an eminence, and is thence divided into an upper and a lower town. It is pretty well built, mostly in the Gothic style, and has a square ornamented with a statue and fountain; but still it has a dull and stagnant appearance. It has three suburbs, and is surrounded by a double wall, having a foss and five gates. The most remarkable public buildings are the palace of Baron Bruckenthal, the favourite minister of the Empress Maria Theresa, containing an extensive library and fine museum; the churches, 9 in all (viz., 4 Lutheran, 1 Calvinist, 3 Rom. Cath., and 1 Greek); the barracks, the military hospital, and the orphan asylum. The Lutherans have a gymnasium, in which the study of divinity, law, and philosophy is pursued, and a free school; besides which, there is a Rom. Cath. gymnasium, and a normal school. Hermanstadt is the head quarters of the commander-in-chief of the troops in Transylvania, and several departments of the government, as the customs, post-superintendence, &c., are located here. It is a place of considerable trade, having three markets in the year, and it has manufactures of linen and woollen cloth, hats, &c.: still, however, the town "is not what it was. The overland trade through Wallachia has almost disappeared, and with it the best days of Hermanstadt." The Hermanstadters are said to be of Flemish origin, and have a strange notion that their extraordinary dialect strongly resembles the English. There are not less than seven distinct dialects among these Saxons, all supposed to have been derived from the different parts of Germany from which they originally came. (*Paget's Hungary*, vol. II. ch. 13.)

The town, which takes its name from Hermann, the Saxon chief who conquered Transylvania, is said to have been founded in 1160, and to have early possessed many valuable rights and privileges under the Hungarian government; the greater part of the town, however, was built in the 16th century. It was once the capital of Transylvania, and was then in its most flourishing condition. (*Oesterr. Nat. Encycl.*; *Paget's Hung.*)

HERTFORD, an inland co. of England, having S. Middlesex, E. Essex, N. Cambridge, and W. Buckingham and Bedford. It has a very irregular outline, and a detached portion of Colchill is wholly surrounded by Buckingham. Area, 403,200 acres, of which about 280,000 are arable, meadow, and pasture. A ridge of chalk hills, from 800 to 900 ft. high, runs along the N. frontier of the co., and the rest of its surface is beautifully diversified with uplands and valleys: it has many thriving plantations, and a more than ordinary proportion of fine seats, among which Ashridge and Hatfield occupy the first rank. The sub-soil is generally chalk. It has every variety of soil, and may, on the whole, be said to be of about an average degree of fertility. By far the greater portion of the land is in tillage; and the wheat and barley of this co. are reckoned equal to those of any other district in England. Agriculture is not, however, in a very advanced state. Two white crops not unfrequently follow each other; and the land is mostly ploughed very shallow, and is "in many parts extremely foul." (*Kennedy and Granger on the Tenancy of Land*, i. 239.) Drill husbandry is but little introduced; and the thrashing machine is not used, from a notion that it would injure the quality of the straw, which meets a ready sale in the London markets. Meadow land is in general much better managed than the arable, the quantity of hay produced being large, and

the quality superior. Few cattle are raised or fed in this county; but the stock of sheep is considerable. Few large estates. Farms of various sizes, but not generally large. Leases, where granted, are usually for 7 or 14 years. Average rent of land, in 1810, 16s. 11½d. an acre. With the exception of chalk, the minerals are of no importance. Manufactures not very important. Paper, however, is made on a large scale, of the best quality, and by the most improved machinery, near Watford and Rickmansworth. Malt is extensively carried on at Ware, Hitchin, and other towns; and a good deal of straw plait is made in different parts of the county; silk and cotton are also spun, and ribands made, at Tring, Watford, St. Albans, &c. Principal rivers, Lea, Rib, Beane, Colne, Gads, &c. The Grand Junction Canal passes through its W. parts, and it is also traversed by the London and Birmingham Railway. Hertford has 8 hundreds, and 135 pars.; it sends 7 mems. to the H. of C., viz. 3 for the co., and 2 each for the bors. of Hertford and St. Albans. Registered co. electors, in 1838-39, 5,245. In 1831, Hertford had 26,549 inhab. houses, 29,250 families, and 143,241 inhab.; of whom 71,395 were males, and 71,946 females. Sum contributed for the relief of the poor, in 1838-39, 53,199*l*. Annual value of real property, in 1815, 583,657*l*. Profits of trades and professions, in ditto, 262,989*l*.

HERTFORD, a parl. bor. and market-town of England, cap. of the above co., hund. Hertford, on the Lea, 19 m. N. London. The parl. bor., which includes, besides the old bor. and liberties, portions of the parishes of Brickendon and Bengoe, had, in 1831, 973 inhabited houses, and a pop. of 5,860 persons. The town, which stands in a valley, though irregularly laid out, is respectable in its appearance, well paved and flagged, abundantly supplied with water, and lighted with gas. There are 2 churches, which serve for all the parishes, the others having been demolished. All Saints, the corp. church, is a spacious cruciform structure in the later English style, with a square tower and spire; and St. Andrew's, at the S. end of the town, though smaller in extent, is handsome, and has a low embattled tower and spire, and a large gallery within, for the accommodation of the children belonging to Christ's Hospital. The Independents also, the Wesleyan Methodists, and the Society of Friends, have commodious places of worship. Among the public charities in Hertford, the chief are—

1. A well endowed free grammar-school, founded in the reign of James I., having seven scholarships at Peterhouse, Cambridge.
2. The Green-coat School, founded and endowed in 1760, in which about 50 boys are educated.
3. The branch school of Christ's Hospital, occupying a large brick building with wings, and accommodating 500 of the younger pupils of that great establishment.
4. A girls' charity school, attended by about 50 children.
5. An infant-school.
6. An almshouse for aged people, built and endowed with 50*l*. a year. The principal public buildings are—the castle, originally built in 1090, afterwards enlarged, and now the property of the Marquis of Salisbury (who lets it to the proprietor of a large school preparatory to Hallybury College); the shire-hall, erected in 1771, under which is the corn-market; the sessions-house, in which the assizes are held; and the gaol, on the E. side of the town. About 2 m. from the town is Hallybury College, established in 1806 by the East India Company, for preparing its civil officers for their duties in India. The buildings, erected at a cost of 70,000*l*., contain rooms for the 8 different professors and about 100 students, who receive instruction in divinity, science, law, history, and the oriental languages. The Rev. T. R. Malthus, author of the *Essay on Population*, and Sir James Mackintosh, were professors in this institution. Hertford is a busy town, and there are several mills on the Lea, the principal trade being meal and malt, the produce of which it exchanges with London for coals and other commodities. There are also some large breweries, and an extensive distillery. The markets, held on Saturdays, are among the largest in the S. of England for corn; fairs for cattle are held on the Saturday fortnight before Easter, and on May 12, July 5., and Nov. 8. This bor. received its earliest corporate privileges from William the Conqueror; its markets were granted by Edward III. The corporation now consists of a mayor, 3 other aldermen, and 12 councillors, and holds a commission of the peace: corp. rev., in 1839, 874*l*. Hertford sent 2 mems. to the H. of C. from the reign of Edward I. to the 50th of Edward III., when it was relieved from the burden, on the plea of poverty, and did not regain the privilege till the 22d of James I., since which time it has exercised the franchise. Down to the passing of the Reform Act, the electors were the householders and freemen resident, when they received their freedom. Registered electors in 1838-39, 618. The boundaries of the mun. and parl. bor. are co-extensive.

The date of the foundation of Hertford is uncertain. At the time of the Doomsday survey, the town and lands were divided between the Conqueror and eight of his followers. In the wars between John and his revolted

barons, the castle, originally built by Edward the Elder, was taken from the king, after a month's siege. It was restored in the following reign, and in 1245 was granted, with the earldom of Hertford, to John of Gaunt, who made it his usual residence. The castle was afterwards inhabited by the queens of Henry IV., V., and VI.; and here, also, 150 years later, Queen Elizabeth occasionally resided and held her courts. (*Chauncy's Hist. of Hertfordshire*; *Britton's Arch. Antig. of Great Britain*; *Parl. Rep.*)

HESSE-CASSEL, or ELECTORAL HESSE (German *Hessen*), a state of W. Germany, consisting of a central territory (having N.W. Prussian Westphalia and Waldeck, N.E. Hanover and Prussian Saxony, E. Westphalia, S.E. and S. Bavaria, and W. Frankfort, Nassau, and Hesse-Darmstadt), and several small detached portions, the chief of which are the co. of Schaumburg to the N., and the lordship of Schmalkalden to the E. The whole territory lies between lat. 50° 5' and 52° 25' N., and long. 8° 30' and 10° 40' 30" E., and is subdivided as follows:—

Provinces.	Area in Eng. sq. m.	Pop. 1838.	Ch. Towns and Pop.
Lower Hesse -	2,085	338,500	Cassel - 31,000
Upper Hesse -	1,600	216,000	Kassel - 15,000
Fulda - -	847	155,000	Fulda - 9,900
Hanau - -	583	115,200	Hanau - 15,000
Total -	4,430	704,900	

This is the statement of Berghaus; but, according to the *Almanach de Gotha*, the pop. in 1837 amounted to 812,540; a discrepancy which we are without the means of reconciling.

On entering the Electorate of Hesse Cassel, from Saxony, the country and the men present a different appearance. There is more of the forest; the country is a heap of moderately elevated ridges, stretching across each other in every variety of form and direction, and principally covered with beech woods. (*Tour in Germ.* in 1820-22, i. 329.) The greater part of Hesse-Cassel belongs to the table-land of central Germany, of which it forms the N. extremity, called, by Berghaus, the "Hessian terrace." Its N. part is traversed by the Werra mountains; its central portion is occupied by the plateau of Fulda; and its territory towards the S.E. and S. covered by the Ithön, Spessart, and other mountain ranges, which enter Hesse from Bavaria. No summit, however, rises higher than the *Meissner*, belonging to the Werra range, which is 2,327 ft. above the level of the sea. The co. Schmalkalden, between the Prussian, Saxe-Meiningen, and Saxe-Gotha territories, is covered by the Thuringian forest-mountains, and Schaumburg, between Hanover, Lippe Detmold, and Prussia, by ramifications of the Harz. Electoral-Hesse belongs principally to the basin of the Weser, which bounds it to the N., and receives the Fulda, Werra, Eder, Schwab, Diemel, Lahn, &c.; the Main bounds it to the S., and receives the Kinzig, and Nidda. There are many large ponds, especially in the N., though none is large enough to be called a lake. The climate is healthy, but in winter the cold is severe, except in the prov. Hanau, S. of the elevated plateau of Fulda, and in the vale of the Werra, where some wine of an inferior sort is grown. The medium temp. of the year throughout the Electorate is about 50° Fahr. The soil is stony, sandy, and no where particularly fertile, except in Hanau. It is there very productive, and rye is reported to yield 16 or 20 fold, and wheat and barley in good situations as much as 24 fold, but such statements are uniformly almost greatly exaggerated. The whole country, however, is capable of being rendered much more productive than at present; only the narrow valleys and the lower portion of the hill-slopes are cultivated, and the valleys, which, from their confined extent are exposed to excessive moisture, are very imperfectly drained. A degree of indolence pervades the people in the rural districts; the villages have more of the Bavarian than the Saxon character, being often composed of mere ruinous wooden hovels; and the inhabitants are commonly dirty, squalid, and slovenly. Agriculture is their chief occupation; it is in the most forward state in the valleys of the larger rivers. More corn is grown than is required for home consumption; it is principally rye, barley, and oats. These are everywhere cultivated; wheat is grown chiefly in Lower Hesse: the yearly produce of these four species of grain is estimated by Berghaus at 4,000,000 *schepel*. Buckwheat is grown only in Schaumburg, and some parts of Fulda; and maize is confined to Hanau. About 850,000 *schepel* of pulses of various kinds are annually grown, and from 700,000 to 800,000 *sch.* of potatoes; these products compose the chief articles of food in the higher districts, besides which, potatoes are used to some extent in distilleries. Tobacco, esteemed the best in Germany, is grown in Hanau, and on the banks of the Werra in Schmalkalden: its annual produce averages from 17,000

to 20,000 cwt. Flax, also, of good quality, is largely cultivated in the S. N. provs., and about 150,000 *elms* are obtained yearly. Wine, which is almost exclusively produced in Hanau, does not amount to above 1,000 *cimers* a-year. Orchards are everywhere numerous; hemp, hops, chicory, poppy-seed, and culinary vegetables, are the remaining articles of culture. Hesse-Cassel is one of the most richly-wooded countries of Europe; nearly 1-3d of its surface, particularly in Fulda, Hanau, and Schmalkalden, is covered with forests. In the Thuringian forest, and in Hanau, *firs* are the principal trees; in the more level country oak, elm, beech, &c. predominate; the oaks are in some parts very fine. Juniper-berries form an article of considerable export from Lower Hesse. The pastures are good, but cattle are not numerous. In 1833 there were, in all, about 817,300 head of live stock: more than half the number being sheep of improved breeds. Hogs and poultry are plentiful; not so bees. Game is not very abundant, and fisheries contribute but little to the support of the inhab. The peasantry, like their neighbours throughout Westphalia, are principally hereditary tenants; and the author of a *Tour in Germany*, &c. remarks, "You will find men among them who boast of being able to prove that they still cultivate the same farms on which their ancestors lived before Charlemagne conquered the descendants of Herrman (*Arminius*), or, for any thing they know, before Herrman himself, drawing his hordes from these very valleys, annihilated the legions of Varus." (1. 330.)

Mining is pursued, more or less, in all the provs. About 56,000 cwt. of iron, 5,140 cwt. of cobalt, and 1,000 cwt. of copper are obtained annually. There were formerly some tolerably productive silver mines near Frankenberg, in Upper Hesse, but they have long ceased to be wrought: a small quantity of silver still, however, is obtained near Bieleh, in Hanau. About 235,000 cwt. of rock-salt, 300,000 cwt. of coal, 400,000 cwt. of bovey coal and turf in large quantities are annually produced. Coal of a good quality is abundant throughout the country; but the inhab. have a prejudice against it, and it has not been brought into general use. Manufactures have not yet reached any high degree of importance, but they are said to be rapidly increasing. Linen weaving and spinning are the most widely diffused, and form throughout the country the common auxiliary employments of the small farmers and their families. The fabrics are of every quality, from the coarsest household cloths to the finest damask. The town and prov. of Fulda are the chief seats of this branch of industry, and it is estimated that from them alone 140,000 pieces of linen are exported, a large proportion of which are sold under the denomination of Osnaburgs. Schmalkalden is, however, the only district in which there is any approach to manufacturing establishments on a large scale; it is the seat of extensive iron works, and manufactures of fire-arms, cutlery, hardware, &c. though these articles have not attained to any great degree of perfection. Iron and steel wares are also made in the valley of the Weser. Coarse woollens, stockings, camlets, carpets in Hanau; leather, tobacco, glass, crucibles, porcelain and earthenware, paper, hats, gunpowder, tar, wooden wares, and musical instruments are among the other chief articles of manufacture. There are many bleaching and dyeing establishments, breweries, and distilleries. Cassel and Hanau are the principal manufacturing as well as commercial towns.

The great article of export is linen cloth, about 200,000 pieces of which, of the value of 1,000,000 dollars, a year, are exported by way of Bremen and Frankfurt, chiefly to Holland, Denmark, and America. The other principal exports are linen yarn, woollen cloth, hats, jewellery, hides, sheep-skins, paper, iron and steel wares of all kinds, crucibles, timber, corn, dried fruits, spirits, &c. The chief imports are colonial goods, drugs, wine, flax and hemp seed, silk, fine wool, and woollen fabrics, mirrors and other glass wares, herrings, stock fish, hordes, cattle, tin, gold, silver, tobacco, &c. The imports and exports nearly balance each other; but the most profitable branch of commerce to the Electorate is the transit of trade; the grand routes of communication between Frankfurt and Hamburg, Berlin, Dresden, &c. passing through the territories of Hesse Cassel. The dollar current is that of Prussia = 3s. The Hessian *el* is = 623 English yard, the foot = 943 English. The *wertel* of corn = 55 English qr.; the cwt. is nearly equivalent to the English.

The Government is a limited monarchy, hereditary in the male line only. The different orders in the state are represented in one parliamentary chamber, composed of 82 members, consisting of the heads of the collateral branches of the electoral family, the mediatised nobles, the family of Riedesel (hereditary lords-marshal) and the secularised convents of Kaufungen and Wetter, 6 deputies from the nobles and knights of Hanau, Fulda, and Hersfeld; 16 from the towns, and 16 deputies sent

by the peasantry. The peasantry are, however, debarred from being representatives of their own order, by the circumstance of their habitually speaking only a Low German dialect, the vernacular tongue of the country, while the discussions in the assembly are carried on in High German. The states assemble at least once in 3 years. The inhab. of Electoral Hesse in the last century suffered much from the oppression and rapacity of their rulers, who were accustomed, amongst other acts of tyranny, to traffic largely in the blood of their subjects, by hiring out their troops to the service of European powers. The supply of Hessian troops to England during the American war brought to the Electoral treasury the sum of 21,276,790 crowns between 1776 and 1784. The conquest of the country by the French put an end to this white slave trade. Though popular at first, the obstinate attachment of the late elector to abuses, and the growing demand of the people for reforms, produced a revolt in 1830, the changes consequent on which have rendered the present government one of the best and most liberal in Germany. The constitution of 1831 guarantees equality under the law, the free exercise of religion, free right of appeal, and eligibility to every office under government; economy in every department of the public service has since been strictly enforced, and the educational institutions have been materially reformed. For civil and criminal justice there is a high court of appeal in Cassel, and a superior provincial court in the cap. of each of the four provinces, and in Rinteln for the co. Schaumburg. With each of these a forest court is connected, and subordinate to them are the district judicial and rural police courts. The town police is under a separate commission; and each of the provincial caps. has a head police court, as well as medical, manufacturing, and commercial tribunals, subordinate to head tribunals of the same kind in the cap. About 4-5ths of the pop. are Protestants, 1-6th part Rom. Catholics, and the remainder chiefly Jews. Except the latter, and between 1,000 and 2,000 individuals, the descendants of emigrants from France, at the revocation of the edict of Nantes, all the pop. are of the German stock. The reigning family is Lutheran, but 3-4ths of the Protestant inhab. are Calvinists. Since 1818, both Calvinists and Lutherans have been united for ecclesiastical government under 3 consistories, at Cassel, Marburg, and Hanau; the Rom. Catholics are under the Bishop of Fulda. The principal establishment for education is the university of Marburg, founded in 1527, which has 57 professors, and is usually attended by from 230 to 250 students. There are *lyceums*, or colleges of arts, &c., at Cassel and Fulda, teachers' seminaries in Cassel, Marburg, and Hanau; gymnasia, or high grammar schools, in the 5 principal towns; several schools of drawing, forest economy, &c., and numerous primary schools. Education was formerly more backward in the Electorate than in any other state in Germany, but such is no longer the case. The armed force is raised by conscription, and every male under 60 years of age capable of bearing arms is liable to be called on to serve. The contingent furnished to the army of the Germ. Confederation is 5,679 men, or, including the corps of reserve, about 7,600 men.

Financial System.—The sum voted for the public expenditure during the triennial period 1837-39, amounted to 11,558,780 dollars; the ways and means for the same period were estimated at only 11,264,780 dollars, and to cover the deficiency a temporary loan of 291,000 dollars was agreed to by the states. The public debt, in 1837, did not exceed 1,540,850 dollars, of which amount 901,050 were in the hands of the government. The direct taxes for the period 1834-36, averaged 626,220 and the indirect 698,400 dollars a year. The former are levied according to the valuation of the produce of the land, or rent of property; and a capital of 25 florins is assumed for every 5 florins of revenue. Every 4 metzen (about a bushel) of rye, and cwt. of hay, is estimated as worth 1 florin, on which a rate of 34 kreutzers is levied. A tax is also paid on cattle. An industry tax, paid monthly, is laid upon all merchants and tradesmen; it being calculated according to the capital supposed to be employed by them. Labourers are rated per month at one day's pay (the price of a day's food having been deducted). The government domains produce to the treasury about 632,000 dollars annually; the forests, &c., 256,000 dollars; the mines, forges, salt works, &c., 200,000 dollars; salt is a government monopoly. The expenses of the court are about 471,600 dollars; of justice, 264,800; the interior, 879,600; the finance department, 798,910; and the army, 742,800 dollars a year. According to the convention of 1831, half the revenues of the electoral property belong to the public treasury; the other half is at the free disposal of the elector; but fresh disputes have since arisen between the electoral house and the nation, respecting the claim to

* The *Encyc. des Gens du Monde* says, that according to the last yearly budget the public revenue amounted to 3,490,000 dollars, and the expenditure to only 3,462,000 dollars.

the property of the landgrave of Hesse Rotenburg, deceased in 1834.

History.—The house of Hesse-Cassel was founded by William the Sage, in 1567. The landgrave was raised to the dignity of elector by the treaty of Lunéville, in 1801, which title he retained when restored to his dominions in 1815, though there was no longer an emperor to elect. From 1806 to 1813 Hesse-Cassel formed a part of the kingdom of Westphalia, of which Cassel was the cap. The electorate holds the 8th rank in the German confederation, having three votes in the full council, and one in the committee. (*Berghaus, Allg. Länder, und Völkerkunde*, iv. 316—328.; *Encyc. des Gens du Monde*, &c.)

HESE-DARMSTADT, or the GRAND DUCHY OF HESSE, a state of W. Germany, consisting of two principal and not very unequal tracts of country, separated from each other by the territories of Hesse Cassel, and Frankfurt on the Main, and of some smaller detached portions chiefly inclosed within the territory of Waldeck, the whole lying between lat. 49° 12' and 51° 19' N., and long. 7° 52' and 9° 40' E. Upper Hesse, the most N. of the two principal tracts, is bounded W. by Prussian Westphalia and Nassau, and encircled on all other sides by Hesse Cassel; the other principal tract has N., Nassau, Frankfurt, and Hesse Cassel; E., Bavaria; S., Baden; and W., Rhenish Bavaria and Prussia; and is separated by the Rhine into the provs. of Starkenberg and Rhenish Hesse. According to Berghaus, the area, pop., &c. of the Grand Duchy are as follows:—[See top of next column.]

Provinces.	Area in sq. m.	Pop. 1838.	Ch. Towns and Pop.
Upper Hesse -	1,570	296,500	Gießen - 7,300
Starkenberg -	1,145	280,000	Darmstadt - 23,000
Rhenish Hesse -	685	306,500	Mayence - 40,500
Total -	3,400	783,000	

The surface is very diversified. Rhenish Hesse and the W. part of Starkenberg consist mostly of a level plain of great fertility; the E. part of Starkenberg is occupied by the richly-wooded Odenwald, a hilly tract, along the foot of which runs the picturesque and celebrated *Bergstrasse*, a very ancient line of road, extending in nearly a straight direction from Frankfurt to Heidelberg. Upper Hesse is hilly or uneven throughout, being intersected by the Taunus, Westerwald, Vogelsgebirge, and other mountain ranges, the last named of which separates the basin of the Weser from that of the Rhine. The loftiest summits of the Vogelsgebirge are about 2,500 ft. in elevation. Next to the Rhine, the chief rivers are its tributaries, the Main, Weschnitz, Selz, and Nahe, in Starkenberg and Rhenish Hesse, and in Upper Hesse the Wetterau, Nidda, Lahn, Eder, Fulda, &c. There are many large ponds, but none worthy of the name of a lake. The climate is generally healthy, but varies very much in different parts. The mean temp. of the year in the plain of the Rhine is about 55° Fah.: in Upper Hesse it is little more than 51°, and snow lies on the Vogelsgebirge for 8 or 9 months of the year.

Hesse-Darmstadt is especially an agricultural country.

Its surface, according to Berghaus, is occupied as follows, reckoning in *morgen* of about 2-3ds of an acre:—

Provinces.	Arable.	Meadow.	Pasture.	Vineyards.	Gardens.	Woods.	Total Surface.
Starkenberg -	806,740	119,496	15,541	2,853	340	492,903	1,428,883
Upper Hesse -	655,801	238,128	14,051	174	859	586,984	1,475,997
Rhenish Hesse -	427,093	56,784	4,595	35,134	2,575	21,523	514,706
Total -	1,889,634	381,406	34,187	38,175	3,774	1,081,410	3,128,296

The plains of Rhenish Hesse and Starkenberg, with the adjacent parts of Baden and Nassau, are amongst the best cultivated, as well as most fertile tracts of Germany; a circumstance which accounts for their supporting a pop. nearly as dense as that of Ireland in comparative comfort, without manufactures, and with but little trade. Rhenish Hesse, in particular, is covered with corn fields, vineyards, orchards and villages; and besides supplying the demand for home consumption, exports corn in considerable quantities. Wheat is the principal produce of the low lands, buckwheat of the Odenwald, and rye of Upper Hesse; but in the higher parts of the latter province little else than barley and oats are grown. In Rhenish Hesse the rotations of crops are various, and studied with constant reference both to the soil and seasons, and the land is never fallow. Poppy seed, rape, tobacco of good quality, and fruit are extensively cultivated in this province; and its vineyards yield some of the finest growths on the Rhine. The total produce of wine in Hesse Darmstadt, is estimated at 180,000 *ohm*, (6,342,500 imp. galls.), two thirds of which are exported. Flax, hemp, hops, and garden vegetables are the other chief objects of culture. Cattle-breeding is practised most extensively in Upper Hesse, where there is an active trade in live stock, including sheep and hogs; but many cattle, &c. are also fattened in the Odenwald, chiefly for the supply of Frankfurt. The principal forest trees are beech, oak, hornbeam, pine, fir, &c.; and in the Vogelsgebirge, maple, elm, and larch. Large quantities of timber and wooden wares are sent from Upper Hesse and Starkenberg, down the Main and the Neckar. In Rhenish Hesse, however, timber is exceedingly scarce and dear, owing to the great destruction of the woods during the French dominion; and nearly all the material required for fuel has to be brought from the Black Forest or Spessart mountains. The forests are mostly either communal or grand ducal property; they belong to the communes, especially in Rhenish Hesse, where, from their scarcity, they are highly valued. In the latter province, and in Starkenberg, property is very much subdivided. The following statement respecting its subdivision throughout the Grand Duchy, has been extracted from the tax-lists of 1834.

No. of individuals paying	Land-tax only	53,487
—	Land-tax and Industry tax	601
—	— and Personal tax	68,420
—	Land, Personal, and Ind. taxes	41,374

The first item shows the number of possessions belonging to foundations and corporations, as well as those under litigation; the third shows the number of landed proprietors of the upper classes; and the fourth the small landed proprietors, all of whom carry on some little manufacture, as weaving, &c. for which they are rated. Heumann estimates the trading capital of the Grand Duchy, as rated for the industry tax, in 1831, at about 911,700 forins, the number of labourers employed in trade being about 68,480, and the number of agricultural

hired labourers at the same period, 43,370. The surplus of the export over the imported agricultural produce, for the three years ending 1831, is estimated, by the same authority, at—corn, principally wheat, 209,638 qrs.; flour, 203,650 cwt.; dried fruits, 10,700 cwt.; tobacco, 39,000 cwt.; spirits, 60,000 cwt.; vinegar, 10,000 cwt.; poppy and rape oils, 38,460 cwt.; though the harvests within that period were by no means abundant.

The condition of the lower classes of agriculturists, who are here, as all over Germany, a kind of copyhold possessors of the land, has been very much improved since the peace. Personal services of all kinds have been redeemed, on easy terms, by the interference of the government, which began by giving up those due for crown lands at a moderate valuation. The tithes on new enclosures were voluntarily resigned both by the crown and by land-owners, and the existing tithes were converted into fixed redeemable rent-charges, for the purchase of which the state advances capital at the rate of 3 percent. interest to the land-owner. A charge to cover this outlay appears annually in the budget.

Mining is the occupation next in importance. Salt mines are wrought at Wimpfen, in a detached portion of territory to the S., enclosed between Baden and Wirtemberg, where this mineral is found in great abundance; and for the supply of Rhenish Hesse, two mines near Kreuznach on the Nahe have been rented from Prussia. Berghaus estimates the produce of salt at 180,000 cwt. annually. Copper is obtained at Thalitz in Upper Hesse, where a vein is profitably wrought, though the ore yields only from 1-6 to 3 per cent. of metal. At Biedenkopf, and on the estates of Prince Solms, in the mountainous parts of Upper Hesse, and in the Odenwald, extensive iron mines are wrought. Coal of inferior quality is abundant in Upper Hesse, and in scattered beds through the other provs.; but the total yearly produce is not more than 280,000 cwt. Turf, building stone, slates, marble, gypsum, and potter's clay, are the other chief mineral products, and there are traces of lead and mercury.

Manufactures on any extended scale cannot be said to exist in the grand duchy. Spinning and weaving linen and hemp are, as above mentioned, an auxiliary occupation of the agricultural classes, particularly in the N. and N.W. parts of Upper Hesse, at Lauterbach, Schlitz, Herbsteln, &c. Among these are damasks and other fine fabrics; but the linens of Hesse Darmstadt cannot compete with those of Westphalia or Silesia. Some silk-weaving is carried on at Offenbach, and stockings are woven there and at Babenhausen. Coarse woollens are manufactured in several places, principally in the N. Tobacco is prepared for use at Offenbach, the principal manufacturing town in the grand duchy. Few metallic articles are made, except needles and pins. Paper, glazed pasteboard for export to Russia, brandy, vinegar, dyes, leather (not enough for home consumption), earthenware, and chemical products, comprise most of the remaining manufactures. The chief articles of export

have been before mentioned, to which may be added linen goods, iron, and Offenbach manufactures. (See *OFFENBACH*.) The principal imports are colonial goods, horses, cattle, hides, leather, leaf-tobacco, and wine. But the transit trade is the most considerable branch of commercial industry. It was very profitable to Mayence as long as obstacles existed to the free navigation of the Rhine, and all wares were forced to be shifted into boats owned in that city. This barbarous privilege has been given up of late years, but a toll is still raised upon boats passing up and down the river. An indemnity has been afforded to the citizens for this apparent sacrifice, by the rapid increase of their markets for corn and wine. Mayence is the emporium of the fruitful districts of the Upper Rhine, as well as of those on the Maine and Neckar. The quantity of wares which came down the Rhine to Mayence, in 1834, amounted to 48,000 tons weight, of which 20,000 were sent on to the Lower Rhine. Besides these goods, 294,000 cubic metres of fir planks and boards, with 41,700 cubic metres of oak planks, were sent down from the forests on the Rhine to Maine and Neckar. The imports from the Lower Rhine in the same year amounted in weight to 43,900 cwt., while 21,750 cwt. were forwarded up the Maine.

Hesse-Darmstadt was a mem. of the German Customs' Union for many years before it was joined by Frankfurt; and a successful attempt was made, while that city held out against the proposals of the Union, to establish a rival fair at Offenbach. The sovereign, the Grand Duke, raised the tolls on the Maine, and the mart of Offenbach was making considerable progress towards prosperity, when the adhesion of Frankfurt to the Union occasioned the abandonment of the experiment.

The florin in circulation, equivalent to 1s. 8d., is divided into 60 kreutzers. The chief weights and measures are the pound=11 lb. Eng., the *ohm*=35.2 galls., the *malter*=44 Eng. qrs., the foot=.82 ft. Eng., and the *soegen*=.62 Eng. acre.

The *Governments* is a limited monarchy, hereditary in the male line. The States consist of 2 chambers. The first is composed of members of the Grand Ducal house, the mediatised nobility, the B. Catholic bishop, the head Protestant ecclesiastic, the chancellor of the university of Giessen, and 10 citizens nominated for life by the grand duke. The second chamber consists of 6 deputies from the knights or inferior nobility, who pay direct taxes to the amount of 300 florins annually, 10 deputies from the towns, and 34 from the freehold landowners, contributing each direct taxes of 100 florins a year. The deputies are elected every 6 years, and the chambers meet at least once in 3 years. No changes in the laws can take place without their sanction, but they never assume the initiative in legislation; they have only the right of petitioning for new laws, which are then submitted to them by the minister. By the constitution of 1820 every subject enjoys freedom of person and property, and the free exercise of religion; all are equal under the law; and all, except the members of the mediatised noble houses, are liable to military service from 20 to 25 years of age. This service may, however, be performed by substitute, and there is a government office, through the agency of which substitutes are obtained on moderate terms. The contingent furnished to the army of the Confederation is 6,195 men; but the peace establishment amounts to 4,642 men. Mayence, the most important fortress in Germany, is garrisoned by equal numbers of Austrian and Prussian troops. The press is free, and the abuse of its freedom is cognisable only by the civil law. The executive powers are in the hands of a prime minister, and 5 others. Justice is administered by 3 cantons, 3 cartons, 3 bunals; high courts in the cases of the prov.; a military tribunal at Mayence, and a superior court and court of appeal in Darmstadt. In Rhenish Hesse the courts of justice are modelled upon the French system, and trial by jury is in force, on which privilege a high value is placed. The laws of the Grand Duchy are, however, obscure, complex, and not embodied in any general code.—defects which are loudly complained of.

About 5-7ths of the pop. are Protestants, 1-4th R. Catholics, and 23,000 Jews, besides whom there are a few Mennonites, &c. The Catholics reside principally in the S., and are subordinate to the bishop of Mayence. The two Protestant confessions have been organised into one, and have assumed the ritual and discipline of the Prussian evangelical church. The reigning family is Protestant. Public instruction has advanced rapidly within the last 25 years, especially in Rhenish Hesse, where, before the peace, the inhabitants generally were grossly ignorant.

In Mayence, which was the seat of a university, there was, in 1815, not a single bookseller, and many-books and catchwords were the only works printed. The institutions for education are now excellent. One elementary school at least exists in every parish, besides which there are 4 citizens' schools, 7 gymnasia, 3 seminaries for schoolmasters, 4 colleges, a military academy,

a university at Giessen, attended usually by from 300 to 400 students, and many special academies for the art, sciences, &c. The communes elect their own headboroughs, and the usual restrictions with respect to marriage and settlement are enforced, as in the neighbouring German States. (See *BADEN*, &c.) Commissions for the support of the poor are appointed in the towns, and, in Mayence especially, the charitable establishments are very well organised. A house of correction for secondary punishment has been established on an improved principle at Marienschloss, in which 350 convicts are confined, who both contribute by their labour to the support of the establishment, and earn a sum which is paid to them on their discharge.

The budget voted for the period 1839—1841 amounted to 7,078,462 fl. for the supplies, the ways and means to meet which were estimated at 7,087,181 fl. The sum voted for the civil list was 830,000 fl. The revenue is raised in the following manner:—1. Land-tax on the appraised value of the land. 2. House-tax on the rental of the house. 3. Industry-tax, for which each man's trade is valued in classes, varying in rank according to the size of the town in which they are carried on. (There are three classes of towns, and in each town seven classes of trades.) The national rental calculated in this manner was, in 1836, estimated at 13,771,642 fl. net revenue; and as the direct taxes amounted in that year to 1,983,361 fl., the rate was 14 p. cent. per an. and, in the province of Hildesheim, the French patent tax, as well as the door and window tax, are retained in the place of the industry and house taxes. Hoffmann gives, however, an instance of the low valuations at which the land-tax is estimated, by citing the sale of an estate for 558,300 fl., which was valued in the tax registers at an income of 16,261 fl. A personal tax is further levied upon persons of independent fortunes, artists, and professional men, who are not included in the industry tax, or who have revenues distinct from their business. This tax is rated according to the value of the house or lodging occupied by each person. The revenues of the crown lands; the tolls on the Rhine at Mayence, and on the Maine at Seligenstadt and Heenheim; the legacy and stamp duty; the excise on wine, beer, and slaughtered beasts; the octroi at the gates of the larger towns; the salt monopoly; and, lastly, the import duties established by the German commercial league, form the other sources of national revenue. The national debt, in 1838, amounted to 9,188,422 fl. The present Grand Duke is the 10th in descent from Philip the Magnanimous, between whose four sons the dominions of Hesse were separated towards the end of the 16th century. The grand duchy of Hesse Darmstadt holds the 9th rank in the German Confederation, having 3 votes in the full diet, and 1 in the committee.

HESSE-HOMBURG (LANDGRAVIATE OF), a state of W. Germany, and one of the smallest in the Confederation, consisting of two detached portions, Homburg and Meisenheim, about 45 m. apart, the former enclosed between Hesse Darmstadt and Nassau, and the latter surrounded by the territories of Prussia, Oldenburg, and Rhenish Bavaria. Divided area, 166 sq. m. Pop. 23,600. The Homburg district lies on the S. of the city of the Taunus mountains, the highest point of which, the Feldberg, is within its limits. The soil is not in general rich, but it has been rendered sufficiently productive by the industry of the inhabitants to furnish more corn than is required for home consumption, besides fruit, garden vegetables, flax, timber, &c. There are manufactures of woollen stuffs, linen fabrics, and stockings, which, after supplying the home demand, find a ready sale at Frankfurt. Meisenheim, W. of the Rhine, is partially covered with ranges from the Hunsrück mountains. Its N. part is high, and its climate cold; but the surface of its S. portion is much less elevated, its temperature mild, and it yields a good deal of wine. Corn and cattle are plentiful, as are timber, coal, iron, and building stone. A little linen cloth, some linen and woollen yarn, glass, &c., are made; and there are a few iron-forges. The government is wholly in the hands of the Landgrave, who appoints his own ministers and executive officers, consisting of the government director, and the ministers of justice and finance. There is a superior court of justice in Homburg; with appeal to the High Court of Appeals in Darmstadt. The pop. is mostly Calvinist; there are, however, about 6,000 Lutherans, 3,000 Rom. Caths., and 1,000 Jews. The public revenue is about 150,000 fl. a year; the public debt amounts to 800,000 fl. The contingent furnished to the army of the Confederation is 200 men. Hesse-Homburg has one vote in the full Diet only. The late Landgrave married a daughter of George III. of England, since whose recent death, we believe, this territory has been united to Hesse.

HETTON-LE-HOLE, a village and township of England, par. Houghton-le-Spring, co. Durham, N.E. div. of Easington ward, 6 m. N.E. Durham. Area of township, 1,960 acres; pop., in 1831, 5,887, having increased

from 919 in 1821. This astonishing increase is wholly attributable to the establishment of a large colliery, connected by a railway with the port of Sunderland. This populous village, chiefly inhabited by pitmen, consists, like most other pit-villages in Durham, of numerous cottages fronted by little gardens, and interspersed here and there with houses of a better character. A church, dependent on that of Houghton-le-Spring, several places of worship for dissenters, and some good and well attended schools, have been established since the place has risen to its present importance. (See HOUGHTON-LE-SPRING.)

HEXHAM, a market town and par. of England, co. Northumberland, S. div., Tyndale ward, 20 m. W. Newcastle, and 33 m. E. Carlisle. Area of par., 28,370 acres. Pop. of township, in 1831, 4,666; do. of par., 6,042. The town stands on a high bank S. of the Tyne, a little below the confluence of its N. and S. branches, on the railway from Newcastle to Carlisle, and in the midst of a rich and well cultivated country. A handsome stone bridge of 9 arches connects it with the N. bank of the river. The streets, though narrow and irregular, contain several good houses; and the market-place, with the conduit in the centre, is a handsome quadrangle, on the S. side of which is an old market-house, supported by pillars, and beneath it are stalls for butchers and country dealers; on the E. side, surmounted by a stone tower, formerly used as the town gaol, is the ancient town-hall, where the manor court and petty sessions are held; and on the W. side is the Abbey church, partly in ruins, and now consisting only of a transept and choir of mixed Norman and Gothic architecture, with a square tower, 90 ft. high, rising from the centre of the building. The living is peculiar to the prov. of York, and the great tithes are appropriated to one of the stalls in York cathedral. The Rom. Catholics have a handsome chapel, besides which there are places of worship for Wesleyan Methodists, Independents, and others. A free grammar-school, founded by Queen Elizabeth in 1594, was subsequently endowed with property for the education of the youth of this and of the adjoining towns and parishes. The foundation boys, whose number is not limited, pay a stipend of 7s. 6d. a quarter, and about 40 more are educated with them, the instruction not being exclusively classical. A mechanics' institute, a savings' bank, and a dispensary have been established of late years.

Hexham has long been famous for a peculiar description of gloves, called "tan-gloves," they were formerly much worn, but of late years have fallen into comparative disuse. Hats and coarse worsted goods are also made in considerable quantities; and about half the pop. are employed in these branches of industry. Markets on Tuesday and Saturday, but chiefly on the former; and cattle markets on every alternate Tuesday. Fairs, Aug. 5. and Nov. 8., for live stock and woollen goods. The annual sales in the Hexham market average 4,000 qrs. of wheat, 2,000 qrs. of oats, and 1,500 qrs. of rye.

The site of the town close to Hadrian's wall, and the discovery of many Roman inscriptions, altars, and other monuments, have led to the supposition that it occupies the site of the Roman station *Axelodunum*. St. Wilfrid, archbishop of York, introduced into Hexham the arts of France and Italy. This prelate made it a bishop's see and a co. palatine; but in 883 it was united with Lindisfarne, and finally, in 1112, was annexed to one of the prebends in York cathedral. David, king of Scotland, shortly before the battle of Neville's Cross, halted here for three days. The church, which had been ruined, was rebuilt by Thomas, Archbishop of York, who also founded a priory of Augustinian canons, the annual revenues of which amounted, at the dissolution of the monasteries, to 138l. (Hutchinson's *History of Northumberland*; Britton's *Cathedrals and Churches*; Dugdale's *Mon. Angl.*)

HIERES, or HYERES, a town of France, dép. Var, cap. cant. on the S. declivity of a conical hill, 3 m. from the Mediterranean, and 34 m. S. W. Draguignan. Pop. (1836) 4,246. It commands beautiful and extensive views, but its internal appearance is far from corresponding with its situation, its streets being steep, narrow, crooked, dark, and very badly paved. Its highest point is crowned by the ruins of an ancient fortress, from which descend on either side the traces of a line of thick walls, that formerly surrounded the whole town. In the *Place Royale*, a large but gloomy-looking square, is a column, surmounted with a fine marble bust of the most illustrious of its citizens, Massillon, born here on the 24th of June, 1663. The suburb at the foot of the hill is much pleasanter, and more frequented by visitors, than the town itself: it has some excellent hotels. It is said that Hieres was formerly a sea-port; at present, a plain of great fertility intervenes between it and the sea, covered with orange plantations, the best in France, vineyards, and olive grounds. The town has manufactures of orange-flower water, and other perfumes; brandy, oil, silk twist, &c.; and trades in these articles, olives and other fruits, and wine. Under the name of *Arcae*, this was one of the

colonies anciently established by the Greeks on the shores of the Mediterranean; and the Romans called it *Hicrus*, but the monuments with which they embellished the city have entirely disappeared.

HIERES, ISLES OF (an. *Stachades*), a group of four small islands in the Mediterranean, about 10 m. S.E. Hyères, and 14 m. E.S.E. Toulon. Porquerolles, the largest, is 5 m. long by 3 m. broad: it is fortified, and has about 100 inhab. Port-Croz has also a garrison, and about 80 inhab. The other islands are surrounded by several rocky islets. None of them is fertile. (Hugo, art. *Var*, &c.)

HIGHAM-FERRERS, a bor., market town, and par. of England, co. Northampton, hund. of same name, near the Nen, 14 m. E.N.E. Northampton. Area of par., 1,871 acres: pop., in 1831, 965. The town stands on a rocky height, commanding a fine view over the valley of the Nen. The church has a finely ornamented W. front, and a tower and spire 160 ft. high. A monastic college founded here in 1422 was surrendered in 1543, and a portion of its revenues was devoted to the endowment of the present free school, recently rebuilt in a handsome style. Higham-ferrers, which, a few years ago, had a respectable lace-trade, is now quite insignificant as a place of industry; and the business originating in its position on a great north road, has been greatly lessened by the recent opening of the railways. This insignificant place, which is a bor. by prescription, sent 2 mems. to the H. of C., from the reign of Philip and Mary, down to the passing of the Reform Act, by which it was disfranchised. The franchise, though nominally vested in the freemen, was really exercised by Earl Fitzwilliam, the proprietor of the greater part of the borough.

HIGHGATE, a village and chapelry of England, par. in Hornsey, and partly in St. Pancras par., co. Middlesex, hund. Osulston, 4 m. N. London. The pop. is estimated at 4,000. The village stands on the top and sides of a hill about 450 ft. high; and many of the houses are well built, being occupied by opulent merchants and others belonging to London. On the top of the hill, on the road towards Barnet, is the Gate-house, formerly a toll-gate at the boundary of the Bishop of London's estates. For many years a tavern has existed here, in which strangers are "sworn at Highgate;" that is, in which an old custom is kept up of swearing them not to drink small beer when they can get strong, &c., "*swears they like it better*." The old chapel, built in 1565 as a chapel of ease to Hornsey, was replaced in 1832 by a neat church in the pointed style, contiguous to which is a spacious cemetery. The dissenters have 3 places of worship, to all of which are attached large Sunday schools. The grammar-school, founded in 1562, was for many years almost useless; but, in consequence of the representations of the charity commissioners, a reform was effected in its management, and it has lately become an efficient well-attended classical school. Its master, who has a salary of 150*l.* a year, is the reader and preacher at the church. Many good boarding-schools for boys and girls are established in and about the village. There are almshouses for 12 poor persons, and 2 well-supported charity schools. E. of Highgate runs the great north road in an excavated hollow, about 60 ft. deep at one spot, where it is crossed by a bridge or archway, forming the thoroughfare to Hornsey. Close to the opening of the archway-road is the mercers' hospital, a handsome Elizabethan structure, with 2 wings, and a chapel in the centre. Caen-wood, the beautiful seat of the Earl of Mansfield, lies between Highgate and Hampstead.

HILDESLANDS. See SCOTLAND.

HILDESHEIM, a town of Hanover, cap. of princ. and landgraviate, on the Innerste, a tributary of the Leine, 19 m. S.E.E. Hanover, and 41 m. S. Göttingen. Pop., in 1838, 15,000, of whom about one third, with the bishop, are Rom. Cath. It is a large old town, surrounded with ramparts, now used as public promenades, irregularly built, and having extremely narrow streets. Among its churches, the cathedral, erected by Louis the Pious, in 818, is remarkable for its fine bronze gates of the 11th century, its paintings on glass, and for a hollow pillar of greenish stone supposed to have been a Saxon idol, and now surmounted by a statue of the Virgin Mary. This, and 3 other churches, belong to the Rom. Caths., who have also a consistory and a divinity college attended by 42 students. The other educational establishments are a Lutheran gymnasium with a good library, 9 schools, and a large and admirably regulated poor-school connected with a house of industry. The other public buildings and institutions are the episcopal palace, council-hall, treasury, lunatic asylum, three orphan houses, and an establishment for the deaf and dumb. The trade of Hildesheim is inconsiderable, except in coarse linen cloths and yarn: its other products are leather, soap, starch, snuff, bleached wax, and earthenware; but cattle-fairs are held here said to be the largest in the kingdom.

HILLAH. See BABYLON.

HIMALAYA MOUNTAINS (THE). (San. *Himalaya*, abode of snow; an. *Himav* or *Emodus*), an extensive mountain range of Asia, and the loftiest of which we have any knowledge, bounding the low and level plain of Hindostan on the N., and separating it from the table-land of Tibet, which stands 10,000 ft. above the sea. This chain is continuous westward with the Hindu-kooch and Belur-tagh, and E. with the table-land of Yun-nan; but the term Himalaya is usually restricted by geographers to that portion of the range lying between the passages of the Indus and Brahmaputra, or San-poo; the former being in lat. 35° N. and long. 75° E., and the latter in lat. $28^{\circ} 15'$ N., and long. 96° E. The direction of the range, as thus defined, is S.E. from the Indus to the Gunduk, and thence E. to its termination. Its entire length is 1,900 m., its average breadth 90 m., and the surface which it covers is estimated at 160,000 sq. m. The N.W. extremity of the chain, called the Gosselle mountains, extends in a S.E. direction along the sources of all the Punjab rivers, except the Sutledge, and separates the hilly part of Lahore from Little Tibet. E. of the Sutledge, which cuts a passage through the mountains, in lat. 31° $30'$ N., and long. 77° $40'$ E., the range, still running S.E., crosses the heads of the Jumna and Ganges; it then, in its course E., gives rise successively to the Gogra, Gunduk, Cosi, Mahananda, and Teesta, and is bounded on both sides at its E. extremity by the circuitous channel of the San-poo, to which, however, it contributes few affluents of importance. The average height of the Himalaya chain is estimated by Berghaus at 15,700 ft.; but numerous peaks exceed in altitude the Chimborazo of the Andes, so long supposed to be the highest point on the globe. The principal of these are as follows, with their situation and height from the sea.

Name.	N. lat.	E. long.	Height.
Baidung, in Gurhwal	$31^{\circ} 28'$	$78^{\circ} 28'$	24,411
Jumna, do.	$31^{\circ} 2'$	$78^{\circ} 36'$	24,155
Badrinath, do.	$30^{\circ} 42'$	$79^{\circ} 20'$	25,441
Jawahir, in Kamaon	$32^{\circ} 42'$	$79^{\circ} 57'$	25,749
Koonlus, in Nepal	$30^{\circ} 15'$	$83^{\circ} 15'$	26,562
Dhawalagiri, do.	$28^{\circ} 30'$	$83^{\circ} 30'$	26,730
Gosainath, do.	$28^{\circ} 16'$	$85^{\circ} 10'$	26,243
Salpu, do.	$27^{\circ} 45'$	$86^{\circ} 0'$	26,400
Chamaleri, in Bootan	$28^{\circ} 4'$	$89^{\circ} 23'$	26,400

The passes over the main ridge, as far as we know at present, amount to about 20, a few only of which are practicable for horses, sheep being chiefly used as beasts of burden over the steeper passes. Their height above the sea varies from 10,000 to 18,000 ft.; the principal are, the Kandrial pass, between Cashmere and Ladak; the Paralaba (16,500 ft. high), leading from the Upper Chenab valley to Ladak; the Siatool, Boorendo, and Pining passes, all much frequented, on the road N. on the valley of the Sutledge; the Ghang-tang-gaht (10,150 ft.), practicable for horses, and leading up the bed of the Bhagrathi to Chaprung, a Chinese post on the Upper Sutledge; the Nete-gaht (16,814 ft.), used by the great caravans passing between Tibet and N. Hindostan; the Doora-gaht (17,790 ft.), also a much frequented route, connecting the valley of the Kalee with Dumno, in Tibet; and the Mastang pass, near the source of the Gunduk; the passes to the E. of this river are little known. The glens through which these mountain-tracks run are usually at right angles with the main range, and the N.W. face is invariably rugged, and inclined at an angle of 50° , while the S.E. slope is more smooth, and has an inclination of only 30° or 30° . (Lloyd and Gerard, ii. 29. 61.) The limits of perpetual congelation in the Himalaya chain, which, according to Leslie's theory, would be 11,400 ft. above the sea, have been ascertained, by the observations of Webb, Gerard, &c., to be generally higher, and they have likewise proved that, while the snow-line on the S. slope is at an elevation of 12,400 ft., the mountains on the side of Tibet are free from snow in summer as high as 16,900 ft. This unexpected circumstance is attributed by some to the difference between the serene climate of Tibet and the foggy atmosphere of Hindostan; but by Lyell and others, with more probability, to the influence of the heat radiated by a great continent in moderating the cold. (Lyell's Geol., i. 181.)

Geology.—The only rock sufficiently extensive to characterise the geological formation of the great chain is gneiss, which constitutes the substance of the highest ridges and crests. Granite veins occur on the surface only in some directions, intersecting the gneiss; but Captain Johnson and other travellers are of opinion, that granite forms the base of the mountains, and that gneiss is superimposed on the general bed. On leaving the centre of the range, schistus and clay-slate, primitive and secondary limestone, and red sandstone are successively met with on either side. Even in the centre of the chain, however, masses of limestone and sandstone have been found at an elevation of 16,000 and 18,000 ft., looked here and there in unpassured crystalline rocks, a

phenomenon observable also in the Alps and Pyrenees. (Geog. Journal, iv. 64.) The fossil remains found in the Himalaya mountains consist of bones of many different species of ruminating animals (some of which were found by Captain Webb at an elevation of 16,000 ft.), of ammonites, belemnites, and various kinds of land and fresh-water shells. The chief minerals hitherto found are sulphur, alum, rock-salt, gold dust, copper, lead, iron, antimony, and manganese; and the mines of Nepal are reported by Buchanan Hamilton to produce large quantities of lead, copper, and sulphur. (Hamilton's Nepal, introd.) There are no direct traces of volcanoes in the districts explored by the English; but the numerous thermal springs (that of Jumnoti having a temperature of 194° Fahr.), and many shocks of earthquakes felt by travellers in different parts of the range, indicate it to be the focus of subterraneous movements and derangements of the earth's crust. Among the physical phenomena observed on this great chain may be mentioned the falls of the Pabur, the highest known, and exceeding 1,500 ft., and the dripping-rocks of Sarrarah, near Deyra Dookh, in Gurhwal, resembling, though on a larger scale, those of Knaresborough in Yorkshire, and Roslyn, near Edinburgh. This rock, situated in a glen surrounded by mountains rising almost perpendicularly to the height of 5,000 ft., and clothed to the very top with the most beautiful wood, overhangs a small basin of water like the roof of an open piazza, extending about 50 yds. in length; and above it is a small stream, which being absorbed by the marshy nature of the soil, is filtered through it, and falls into the basin in a continual shower. The roof of the rock, and also of a neighbouring cave, are covered with stalactitic incrustations, which in some cases have descended to the floor, having the appearance of sparkling pillars. (Capt. Johnson, in Geog. Journ. iv. 43.; and Hamilton's Gaz.)

Vegetation.—The height at which plants and trees flourish on the Himalaya range varies on the N. and S. slopes, nearly proportionally to the difference in the altitude of the snow-line. On the S. slope, grain cultivation is not attempted higher than 10,000 ft., the 'highest habitation is at an elevation of 9,500 ft.: pines (which form by far the largest proportion of forest in every place) show their best growth at a height of 10,300 ft.; but beyond 11,000 ft. they grow in smaller quantities, and are of less girth and growth. The rhododendron grows up to 12,000 ft., and birches are found as high as 13,000 ft. above the sea. (Gerard and Lloyd, i. 343., li. 9.) On the N. side, villages are found between 11,000 and 13,000 ft. high, and grain cultivation advances to a height of 13,500 ft.; birch-trees rise to 14,000 ft., and vegetation is found up to an elevation of 17,500 ft., that is, upwards of 3,000 ft. higher than on the S. slope. The grains found on these heights are wheat and barley, bhutao (*Amaranthus amarus*), cheenah (*Panicum mitis*), rhoda (*Paspalum serotinum*), and rice (*Oryza sativa*), of which the Cashmere and Nepaul stag, the black deer, the *Cervus Capreolus*, the chirn or one-horned antelope, the goral, and the nygaur. Among the birds of the Himalaya may be mentioned the lammer-geyer (*Gypsetus barbatus*), the chucoree (*Perdix rufa*), the common cuckoo, the Impeyan pheasant (*Lophophorus fulgens*), the red-legged crow, and the wood-pigeon. (Ritter's Asia, ii. 111.; Geog. Journ., iv.; and Lloyd and Gerard's Tour in the Himalaya; and Berghaus's Asien, with Maps.)

HINCKLEY, a market town and par. of England, co. Leicester, hund. Sparkenhoe, 19 m. S.W. Leicester. Area of par., 6,900 acres; pop. of town, in 1831, 6,490; do. of par., 7,180. The town stands on a commanding eminence close to Warwickshire, from which it is divided by the old Roman Watling Street: it is well built, though old, and near the centre stand an ancient town-hall and school-house. The church is a fine old Gothic building, with a tower and steeple 120 ft. high. The dissenters have 5 places of worship, connected with which and the church are Sunday schools, attended by 1,200 children. There are also an endowed national school, with 180, and an infant school, with 180, children. The staple manufacture of the place is hosiery, introduced about 1640, and now employing in the town and neighbourhood upwards of 2,000 hands. Coarse substantial stockings are said to be made here in larger quantities than in any other part of England. Markets (well attended) on Monday: fairs 1st, 2d, and 3d Monday after Epiphany; Easter Monday, Monday

before Whit-Sunday, and Whit-Monday, for horses and live stock; Aug. 26, and Monday after Oct. 26.

Near the Ashby-de-la-Zouch canal, which passes close to the town, are the remains of a Roman fortification, and the remains of a wall and ditch, traceable all round, indicate Hincley to have been formerly a place of some importance.

HINDOSTAN, or INDIA ON THIS SIDE THE GANGES OR BRAHMAPUTRA. Name and Limits.—The ancient inhabitants of India had no common name for themselves or their country; but their Persian neighbours called the people Hindoos, and the country, as far as they knew it, Hindostan; words which, in old English, would have been accurately as well as literally rendered, "Negro," and "Negroland." The comprehensive sense in which the term Hindostan is now employed, as distinctive of the entire territory S. of the Himalaya mountains, over which the institution of castes prevails, is of European origin; the people of the country confining the term to the territory lying N. of the Nerbuddah, and calling all to the S. of that river the Deccan, a word derived from the Sanscrit, and meaning "the right hand," and also "the south." In the European sense, Hindostan comprises the whole of that vast triangular country extending from the borders of Little Tibet, in about the 35th deg. of N. lat. to Cape Comorin, in about the 8th deg. It is bounded on the N. by the highest range of mountains in the world, the Himalaya; and by the two great rivers, the Brahmaputra and Indus, on the N.E. and N.W.; and in every other direction by the ocean. It comprises in all an area of between 1,200,000 and 1,300,000 sq. m., or about a third part of the estimated area of Europe; but from the absence of gulphs, inland seas, and lakes, the proportion of solid land is greater.

Surface and Geology.—The surface of Hindostan, taking this word in its widest acceptation, is of a very marked character. On the N. constituting the base of the triangle, we have three great ranges of mountains, with elevated valleys between. These chains rise, the one higher than the other as we proceed northward, the last constituting the highest mountains hitherto discovered. For 1,000 m., from China to Cashmere, a plain might be extended, resting on peaks 21,000 ft. high, while some are even 6,000 ft. above this elevation. The valleys themselves are from 2,000 to 4,000 ft. above the level of the sea. Primitive rocks alone compose the higher ranges. Gneiss predominates; but with it is found granite, mica slate, hornblende schist, chlorite slate, crystalline limestone, and marble. On these repose clay slate and flinty slate. In the lowest or southern range, sandstone composes that portion which terminates in the plain of the Ganges. Crossing this plain, and proceeding southward, we come to another chain of mountains, the Vindhyan range, running nearly E. and W. across the centre of Hindostan, in about the 23d deg. of lat. This is the basis of a triangle of mountain ranges which supports the vast table-land of Central India. The formation here is primitive, consisting chiefly of gneiss; but where it terminates in the N.W., where the Vindhyan range terminates, and runs in a direction nearly N. and S., to between the 10th and 11th deg. of latitude, until at Colimbatore they meet the E. range, or Ghauts. The formation of this chain is primitive; but to the N. there is a great extent of overlying trap, columnar, prismatic, tabular, and globular. To the S. again, the overlying rock to a great extent is laterite, or clay-iron-ore. The W. is much more elevated and continuous than the E. Ghauts, and some of its highest granitic peaks rise to the height of from 6,000 to 8,700 ft. It is remarkable for the absence of valleys of denudation, and of rivers running W., but is covered with extensive forests. In fact, the sea, in some situations, comes up to the very foot of the mountains, and nowhere leaves anything more than a narrow belt of low land, much broken by deep and narrow inlets. This is the coast of Malabar, exposed to all the violence of the S.W. monsoon, blowing without interruption for six months from the coasts of Africa and Arabia. Where the E. and W. Ghauts

meet, commences the remarkable valley or gap of Colimbatore, which leaves a clear breach in the mountain chains, extending from the E. to the W. sea. A single chain of the same formation as the E. Ghauts then runs all the way to Cape-Comorin, leaving the plain of Travancore to the W., and the more extensive plain of Madura and Tinnevely to the E. The E. chain, or Ghauts, may be said to commence at the Neilgherry hills, which are among the highest mountains of S. India. From this point they diverge in an E. direction, and soon break into a succession of parallel ranges less elevated and more broken than the W. Ghauts. In their further progress to the N., the E. Ghauts break into subordinate ranges and valleys, which give passage to the great rivers that drain nearly all the waters of the peninsula into the Bay of Bengal. This range terminates nearly in the same parallel of latitude to the W. Granitic rocks, especially sienite, form the basis not only of the E. chain, but of the range which runs from the gap of Colimbatore to Cape Comorin. The sienite discovers itself at all the accessible summits, from Cape Comorin to Hyderabad, from the 8th up to the 17th deg. of latitude. Resting on the granite, gneiss, and talc-slate, that form the sides and bases of the chain, are sometimes seen clay, hornblende, flinty, and chlorite slate, with primitive marble of various colours. At the Pennar river, in the 14th and 15th deg. of latitude, clay iron-ore, or laterite, expands over a large surface, and sandstone begins to appear. At Visagapatam, Ganjam, and Cuttack the same formation continues, and the laterite extends through Midnapore up to Beerbhoom, sometimes reposing upon sandstone. A cellular carbonate of lime, called kankar, peculiar to the geology of India, is found over all the district now named, as well as in many other parts of Hindostan. We come now to the great coal-field, which runs for 65 m. in length, and 12 in breadth, on both sides the river Damoda. It is supposed to cross the Ganges, and to extend all the way to Sylhet and Cachar, from which places abundant specimens of surface coal have been brought. The rock formation here consists of sandstone, clay-slate, and shale, the latter, as usual, lying immediately over the coal. Mr. Jones, an English miner, opened the first colliery in India, in the year 1815, at this place. Three pits only have as yet been sunk, and to the depth of 80 ft.; seven seams of the mineral have been met with, one of them of the thickness of 9 ft.: coal is now largely consumed in Calcutta, chiefly for forges and steam navigation. From the Damoda river to Benares granitic rocks prevail. On approaching the river Soane, however, sandstone becomes the surface rock, and, one interval excepted, extends to the N. of Agra, as far as the 28th deg. of latitude. The exception alluded to occurs in the lower portion of the province of Bundelcund, where granite again prevails, while the upper consists of sandstone. The great granitic formation of the table-land itself are granitic, including always gneiss and sienite, with sandstone and the overlying rocks. Basaltic trap extends over the provinces of Malwa and Sagur, proceeds by Nagpore, sweeps the W. portion of the Hyderabad territory down to the 15th deg. of lat., where it bends to the N.W., and running all the way to the coast of Malabar, forms the shores of the Concan. In all, it seems to cover an area of about 200,000 sq. m. We may observe here that the geological formation of India is extremely simple, compared with that of European countries, consisting only of four classes of rocks, viz., the granitic, the sandstone and clay-slate, the trap, and the alluvial. Of the latter we have examples on a great scale in the plains of the Ganges and Indus, which meet between the 28th and 31st deg. N. lat., and the 76th and 77th deg. E. long.; as well as in the plain lying between the E. Ghauts and Bengal from Cape Comorin to Cuttack.

After this view of the surface and geology of Hindostan, the following natural geographical divisions may be made: 1. The range of the Himalaya with their valleys. 2. The granitic plain, comprising only the tract of inundation, and which rises very little above the level of the sea. 3. The upper plain of the Ganges, from the province of Bahar inclusive, up to the foot of the first range of the Himalayas, where the Ganges and Jumna issue from the hills to the N., bounded to the S. by the Vindhyan range, and to the W. by the great desert. The height of the E. portion of this division may be about 800 ft. above the level of the sea, and the land rises gradually as we proceed N., until, where the great rivers emerge into the plain, it has an elevation of 1,000 ft. 4. The N. portion of the great central table-land, as far S. as the valley of the Nerbudda, which generally intersects the table-land in question from E. to W. The height of this portion of the table-land ranges from 1,700 to 2,600 ft., as at the towns of Oojien, Indore, and Mhow. 5. The portion of the table-land which lies S. of the valley of the Nerbudda, down to the junction of the E. and W. Ghauts, and the valley of Colimbatore. The height of the table-land ranges here from 2,000

Ghaut means a pass or passage of any kind, not a mountain.

ft. to 2,400 and 3,000, as at Poonah, Seringapatam, and Bangalore. 6. From the gap of Coimbatore inclusive to Cape Comorin. 7. The narrow strip of low land lying between the W. Ghauts and the sea, or coast of Malabar, including the W. acclivities of the mountains themselves. 8. The alluvial plain, of unusual breadth, which lies between the E. Ghauts and the Bay of Bengal, generally called the Gangetic, rising gradually from the shore to the foot of the mountains: at the town of Arcot, 60 m. inland, it is 490 ft. above the level of the sea;—and 9. The peninsula of Gujrat, with the adjacent country, containing much mountain-land and a few plains. All these differ so materially in their physical aspect, climate, geological formation, animal and vegetable productions, as well as in the character of the nations and tribes which inhabit them, as fully to warrant this distribution.

Rivers.—The rivers of India have their sources either in the Himalaya mountains, or within the great central table-land. The first class are by far the largest and most important. Beginning from the E., the first great river which occurs is the Brahmaputra. The source of this stream is not exactly ascertained; but its course has been estimated at about 860 m., and it is believed to discharge a larger volume of water than even the Ganges. Its course in the plain of Bengal, from Goyalpara to the bottom of the Bay of Bengal, where it debouches, is but 380 m.; and having a rapid current, and passing generally through a wild and inhospitable country, it is of comparatively little service to commerce or navigation. The Ganges, called *Ganga* by all the Indians, has its origin in two principal branches, about 31° N. lat., and between 70° and 80° E. long. Its whole course is reckoned at about 1,350 m.; but from its entrance into the plain at Hurdwar, its course to the sea, into which it falls within a few m. of the Brahmaputra, is about 1,200 m. Within the plain, all its branches are navigable for boats; and the Bhagherettee, its most W. branch, usually called by Europeans the Hooghly, is navigable for ships of 400 tons burden, as far as Calcutta, 100 m. from the sea. According to Major Rennel, the principal branch discharges 80,000 cubic ft. of water per second. The greatest of the affluents of the Ganges is the Jumna. It also has its origin in two branches within the highest masses of the Himalaya, to the W. of the sources of the Ganges. Its course within the mountains is about 120 m.; it issues into the plain about 30 m. W. of the Ganges, and here its bed is about 1,200 ft. above the level of the sea. In the course of a few miles, however, passing over some falls, it takes a lower level. After a course of 450 m., passing by the Mohammedan capitals of Delhi and Agra, and being navigable for a great part of its course, it joins the Ganges at Allahabad. The other principal affluents of the Ganges which take their source from the Himalaya, are the Ram Ganga, which joins the Ganges above Canoge; the Goomtee, which passes by Lucknow, and after a winding course, whence it derives its name, joins the Ganges between Benares and Ghaseepoor; the Gogra, with a course of 600 m., and the largest of the affluents of the Ganges on this side the Himalaya, after passing through Fyzabad and Oude, joins the Ganges above the town of Chupra; the Gandak, which has a course of 450 m.; the Bagmutty, which issues close to Catmandoo, the capital of Nepal; and the Coosy, originating in the table-land of Tibet, and which enters the Ganges at Bogliipoor. The great delta of the Ganges may be said to commence at Sicligilly. The first bifurcation of the Ganges itself commences at Sooty, 20 m. below Rajmahal, at which last place the river is pressed in by some low hills of that name. The Ganges receives, after this, from the Himalaya, the Mahanada and Teesta, which have their sources in the mountains of Nepal and enter with courses of from 320 to 300 m. After the junction of these, the Ganges communicates with the Brahmaputra by a variety of branches. The rivers which fall into the Ganges, or its affluent the Jumna, from the N. acclivity of the central table-land, are the Soane, the Betwahl, and the Chumbul: the latter has a course of 400 m. Both it and the Betwahl fall into the Jumna. The Soane is an affluent of the Ganges, and falls into that river a little above Patna. (See GANGES.)

Lakes.—India is remarkably deficient in lakes, and in fact contains no large collections of water, fresh or salt, such as the lakes of N. America, N. Asia, Switzerland, or even Scotland. In the N. parts of Bengal there are a few freshwater lakes of some extent, but the greater number of this description found throughout the country are supposed to be nothing more than the old channels of rivers which have taken a new course. Of the same character, in some respects, are the Chilka lake in Cuttack, and the Colair lake in the Circars; the first of which communicates with the Mahanuddy, and the last with the Godavery and Kistna. The Chilka lake is 85 m. long and 8 broad, and contains several islands, and abounds in fish: it is separated from the sea by a sand-bank not above 4 m. broad. The Colair lake is 24 m. by 12 in the dry season, but during the

periodical rains, expands from 40 to 50 m. in length. During the latter period, the whole flooded country, including the islands of the lake, are fertilised by the deposit of mud brought down by the two rivers; and hence Major Kennel, with some propriety, compares the neighbouring country to the delta of the Nile. In the sandy desert to the W. of the plain of the Ganges several salt lakes occur, the largest of which, however, does not exceed 30 m. in length. Collections of salt water, more or less connected with the sea, are of more frequent occurrence. Several considerable ones of this nature are to be found on the lower E. coast of the continent; but the greatest and most remarkable is the Rann, lying between the Gulph of Cutch and the mouths of the Indus, which is believed to occupy a space of 5,000 sq. miles.

Coast outline.—The outline of the coast of Hindostan is comparatively little broken by any considerable inlet of the sea. From the mouths of the Indus to those of the Ganges there are but three great gulphs, those of Cutch, Cambay, and Bengal; if the latter, indeed, which, though it breaks the coast of Asia, does not break the coast of Hindostan, can be reckoned in this class. Harbours are even less frequent. Along the W. coast, over 14 deg. of lat., there is but a single good one, Bombay; and from Cape Comorin to the W. mouths of the Ganges, a distance of 1,500 m., there is not one. In this unfavourable feature of its geography India resembles more the W. coast of America, or the E. and W. coast of Africa, than the E. coast of America or the shores of the N. countries of Europe. The Indian coasts are also in a great measure destitute of islands. Unless we include Ceylon, which can hardly be included, there is not one on the E. coast; and on the W. there are, very few, and these of inconsiderable size. In this respect, Hindostan is remarkably distinguished from the two great corresponding Asiatic promontories of Malacca and Cambodia, the coasts of which are thickly studded with islands, many of them of considerable magnitude.

Climate.—A country which embraces 29° of latitude, which contains extensive plateaus, elevated from 2,000 to 3,000 ft. above the level of the sea—some of the most extensive plains in the world, almost on a level with, or but a few hundred ft. above, the sea—the highest range of mountains in the world—tracts of bare rock—deserts of mere sand, and deep primeval forests,—it is needless to say that there must exist a very great diversity of climate. But besides the diversity arising from these causes, the distribution of rain is another source. The whole continent of India, up to the 35th deg. of lat., is subject to the influence of the monsoons, which blow from the N.E. during the serene temperate months of winter, and from the S.W. during the tempestuous and hot or rainy months of summer and autumn. This is the general rule; but in India, as in other countries of Asia under the influence of the monsoons, and where there are ranges of mountains running N. and S. of sufficient elevation to intercept the clouds, the time of the periodical fall of rains is reversed. To the W. of the great chain of the W. Ghauts, on the one hand, over 15° of lat., the periodical fall of rains occurs at the same time with that of other parts of India; or takes place during the W. monsoon. E. of the Ghauts, on the other hand, over 8° of lat., the fall of rain takes place during the E. monsoon; while the table-land which lies between the two ranges partakes, to a moderate degree, in both falls. As a general rule, the year is divided in India into three well-defined seasons: a hot, corresponding with part of spring and summer; a wet, corresponding with part of summer and autumn; and a cold, corresponding generally with our winter months. With respect to temperature, much of India within the tropics, and especially the eastern portion within 12° of the equator, the whole is entitled to the designation of a hot country. On the low plains within the tropic, and up to about the 18th deg. of lat., winter is scarcely perceptible, and the year may be said to be divided into wet and dry. From that parallel N., winter becomes more and more distinct, and beyond the 27th deg. lasts for six months, during which the climate is not inferior in point of agreeableness or salubrity to that of Italy. This is, however, counterbalanced by the severity of the hot and dry season, which lasts for three months, and is so intense as nearly to destroy all appearance of vegetation. On the elevated central plateaus, the temperature is generally from 60° to 100° Fahr. lower than in the same latitudes on the low lands, and the fall of rain being more equally distributed, the necessary effect is a climate in general temperate and agreeable, though not always salubrious. In the valleys between the two great chains of the Himalaya, the same order of seasons generally prevails as in the plains, and here the thermometer is rarely less than 15° or 20° lower than in the plains under the same parallel. A few examples may be given of temperature, as indicated by the thermometer. The mean temperature of Bombay is 82° Fahr., and in the table-

land in the same latitude, at an elevation of 1,700 ft., it is 77°. At Madras the mean annual temperature is 84°, and at Darwar on the table-land it is 75°. At Utakumund, in the Neilgherry mountains, 7,000 ft. above the level of the sea, the mean temperature is 86°, or 28° lower than that of Madras. Here the thermometer sometimes rises as high as 69°, and rarely falls as low as 30°. In the peninsula of Gujrat, and on the level of the sea, the thermometer occasionally rises to 100° in summer, and falls to 45° in winter. The mean annual temperature of Calcutta is 79° Fahr. In May, the hottest month, it is 86°, and in Jan., the coldest, 67°. In summer, however, the thermometer frequently rises above 100°, and in winter falls so near the freezing point that, with a trifling assistance from evaporation, ice is easily obtained. Within the upper portion of the plain of the Ganges, both the latitude and elevation contribute to reduce the temperature. From the middle of Dec. to the middle of Feb. the thermometer sinks every day below the freezing point, and small pools of water are covered with ice, and the average temperature of Jan. is 37°. From April till the middle of June, when the rain falls, the thermometer gradually rises to 90°, and even to 110°; and at Delhi, Agra, and other places on the W. bank of the Jumna, in the whole period from March to June, scorching S.W. winds, proceeding from the desert, prevail. It is in these same countries that, during the whole period from the beginning of Nov. to that of March, the climate equals that of S. Italy.

Nations and Tribes.—Besides foreigners, who, as peaceable immigrants, or conquerors, have settled in India during the last twelve centuries, but chiefly during the last eight, the number of aboriginal races distinguished by differences of language, manners, states of society, and great variation, if not difference, of religious belief, is still very great; and undoubtedly was much greater before the blending which must have been more or less the result of the extensive conquests of the N. invaders. These have been in active operation for nearly 7 centuries, and, in all likelihood, have been materially promoted by the conquests of the more powerful Hindoo states over the smaller. There are at present spoken in India, by the most civilised races, not less than 25 distinct languages or dialects, indicating the existence of as many distinct nations; but, including tribes more or less savage or barbarous, at least 50 languages, indicating the presence of at least as many distinct tribes. Of the more civilised nations, eight may be said to be distinguished from the rest by some superiority of civilisation, as implied in the possession of a national literature, a national alphabet, superior population, superior industry, a greater progress in the useful arts, with the richer and more extensive territory which they are found to occupy. These are the Bengalee, Oriya, Mahratra, Gujratee, Telinga, Tamul, Karnata, and Hindi or Hindostanee nations. The Bengalee nation occupies above 80,000 sq. m. of fertile land, chiefly within the delta of the Ganges, and amounts in numbers to nearly 25,000,000. The Tamul nation occupies 56,000 sq. m. at the S. extremity of the peninsula, and numbers between 6,000,000 and 7,000,000 people. The Telinga nation occupies 100,000 sq. m. of the N.E. portion of the peninsula, and numbers probably between 7,000,000 and 8,000,000 people; and the Oriya nation occupies at least 17,000 sq. m. of the low land which connects the delta of the Ganges with the S. peninsula, and numbers nearly 4,000,000. The Mahratra nation extends probably over 200,000 sq. m. of territory, lying between the 22d and 23d degrees of N. lat., and its numbers may be roughly computed at 12,000,000. The Karnata or Canara nation, occupying a central portion of the table-land S. of the 18th degree of lat., may occupy about 75,000 square m. of territory, and their numbers may be taken at about 5,000,000. The nation speaking the Hindostanee or Hindoo language occupies at least 100,000 sq. m. of the upper portion of the valley of the Ganges, and cannot amount to less than 20,000,000, physically and intellectually the most vigorous of all the Indian races. The most enterprising of these nations, it is to be observed, have occasionally passed, either as conquerors or colonists, into the territories of each other or of their neighbours. Thus we find colonies of the Tamula settled in Malayalim; of Telingas in Karnata and the Tamul country; of Mahratras in the Tamul, Telinga, and Karnata countries; of Karnata colonised in the countries below the E. Ghauts; and colonies from the upper plain of the Ganges settled as far as Gujrat, Bengal, Nepal, and even Malabar. These colonies, of whatever nation, not unfrequently preserve their national language, their original manners, and even the purity of their descent, in their adopted countries. The barbarous and savage tribes of India are universally to be found in the recesses of mountainous and hilly regions, never within the fertile plains or extensive table-lands; and there is scarcely any considerable range throughout India in which some of them are not to be found. They are, however, most numerous on the E. frontier of Ben-

gal, in the fastnesses of the mountainous and sterile region of Gundwana, and generally in the ranges of hills which lie between the Gangetic plain and the great central plateaus. These barbarous tribes have been supposed by some observers to be the aboriginal natives of the country driven from the plains to the hills by strangers and invaders; but this hypothesis seems little better than a gratuitous assumption; the mountaineers are no doubt aboriginal, in common with the inhab. of the plains, and their barbarous condition seems naturally enough accounted for by the unfavourable circumstances of their situation, and their remaining in that condition to the hostility of the powerful occupants of the lower and more fertile lands.

Foreign Settlers.—Besides the original and peculiar inhab. of Hindostan, a crowd of foreign colonists or settlers of different nations, either scattered indiscriminately over the country or confined to particular spots, from the accident of their arrival or other chance, forms a considerable proportion of the present population of the country. These, following generally the order of their arrival, or supposed arrival, are as follows:—Jews, Syrian Christians, Arabs, Armenians, Persians, Afghans, Tartars, Turks, Abyssinians, Portuguese, English, Dutch, French, Danes, and Chinese.

Hindoo Religion.—The forms of religious worship which prevail are the Brahminical, Buddhist, Jain, Seik, Mohammedan, Jewish, and Christian. These, and especially the most prevalent of them, are again divided into many sects. But besides national, colonial, and religious distinctions, there are other nearly innumerable divisions of the great mass of the people. Many are distinguished by the profession which they have immemorably followed; many by their condition as slaves; and many as outcasts, without being slaves: some are in the hunter, and a few in the pastoral state: some are freebooters, others pirates; and there are whole tribes who have, time immemorial, been illustrious as thieves, robbers, highwaymen, and professional assassins. These distinctions into tribes and families are all hereditary; each section and even sub-section is isolated by nearly impassable limits from the rest of the society, in the prov. of Malabar, for example, which contains but 6,000 sq. m. and about 900,000 inhab., there are about 300 different tribes, few of which are founded on distinctions strictly religious or national. In Canara, with an area of 7,700 sq. m. and 657,000 inhab., there are, exclusive of strangers and foreign settlers, 104 native castes; and in the rural district of Burdwan, in Bengal, it was found that in 26 villages, containing a pop. of about 40,000, there existed, independent of strictly religious distinctions, no fewer than 44 castes, chiefly discriminated by the trades or professions which they followed, each caste being known by a distinct name, each being hereditary, and each incapable of eating, drinking, intermarrying, or in any other manner intimately associating with the others!

The circumstances on which this almost infinite distinction is founded are often trivial, and sometimes even ludicrous; and yet the practical separation is not therefore the less real. For example: one tribe of oilmakers in Telingana, who use two oxen in the mill, will hold no intercourse with another following the same profession, but who use one only; they will neither follow the same gods nor the same leaders. The great division of the *right* and *left hand*, which prevails throughout the S. parts of India, but which is not known in the N., does not appear to be of a religious character. One of these tribes ranges itself on one side and another on the opposite; and serious disturbances of the public peace are not unfrequently the result of senseless quarrels which concern neither religion nor politics. It results from this account of the national, colonial, religious, and other distinctions which prevail throughout Hindostan, that society is there composed of an infinity of discordant and heterogeneous materials, incapable of union or combination, and therefore easily overcome, and as easily retained in subjection; and hence one great cause of the facility with which, in all ages, foreigners have overrun India, and held it in subjection.

Under the general name of the Hindoo religion are comprised many different doctrines, and an infinity of sects and castes, which it would be useless, and all but impossible, to describe, or even to enumerate. This religion, perhaps beyond any other, pervades the entire frame of civil society, and mixes itself up with every concern of life, public, private, and domestic. A Hindoo can neither continue his species, be born, die, eat, drink, or perform any of the most ordinary or even vulgar functions of the animal economy, unembarrassed by its trivial and unmeaning ceremonies: military enterprises, the details of commerce, and the operations of agriculture, are more or less under its guidance; it is part and parcel of the code of laws, or, to speak more correctly, it is itself the law. Almost every act of a Hindoo may, in fact, be said to be more or less a religious act. The most civilised and instructed of the Hindoos, but these only,

believe in the immortality of the soul, and in a future state of rewards and punishments. The belief in the transmigration of souls is somewhat more general, but far from universal. There are reckoned to be four orthodox sects, whose principles are determined by the preference they give in their worship to some one of the greater gods of the Hindoo pantheon; for there are gods, great and small, some almost omnipotent, particularly for mischief, and others so feeble as to be all but contemptible, and no match even for an ordinary Brahmin. According to the best authorities, the Hindoo pantheon is peopled by precisely 333,000,000 deities; but as no one has attempted to name them, it can only be concluded that the Hindoo deities are in reality innumerable. They consist of three principal gods, who are supposed to represent (but their powers and functions are frequently interchangeable at the caprice of their votaries) the powers of *creation, destruction, and preservation or regeneration*; and of the families of these, with deifications of the elements and powers of nature, of heroes, and especially of saints and abstract ideas. Among the lower orders of the people, and especially among the ruder tribes, a sort of fetishism prevails; and trees, rocks, and rude masses of stone are worshipped or abandoned, according to the fears, hopes, or caprices of their votaries. The present race of Hindoos are tolerant in all matters of religion, and to speak more correctly, they are indifferent; in fact, they go even beyond indifference, and in cases of emergency are ready to invoke any strange god, or strange saint, by whose aid they may hope to profit. The Mahattri chiefs are in the frequent practice of invoking Mohammedan saints; and Madajee Scindia, the chief of the Mahattri state, a shrewd and politic prince and a great conqueror, was in the habit of making frequent offerings at the tomb of a celebrated saint in Ajmeer, the same to whose shrine Akbar, the most illustrious of the Mogul emperors, walked 230 m. barefooted. The Mohammedans of the lower orders, who in some parts of the country are indeed little better than Hindoos, return the compliment, and in their need propitiate the gods of the Hindoos; and each will join in the religious festivals and processions of the other. In the S. of India the Hindoos, in their distress, will not unfrequently propitiate even the Catholic Christian saints, and the Christian Hindoos reciprocate. It is not, as already stated, to matters of doctrine or morality, that the Hindoos attach importance. In the same tribe, or even family, will be found sectarians of the Destroying Power, of his consort, of the Preserver in several of his incarnations, (the Creator among the Hindoos has no worshippers), all intermarrying with each other, and the wife adopting the opinions of the husband without any difficulty. Some of the Christians of S. India intermarry with the Hindoos of their own tribe, without any forfeiture of caste on either side, provided external observances be attended to. Persecution in recent times is the exception: but the sectaries of Nanak or the Sikhs, have been considerable persecutors in their way: they have destroyed most of the mosques within their territory, and will seldom allow Mohammedans to assemble in the few that remain: they forbid them from eating beef or praying aloud, according to law. What, however, the Hindoos really attach importance to are not doctrinal matters, but distinctions of caste, ceremonies connected with marriage and funeral rites, and the whimsical observances respecting supposed purity and impurity in regard to food and other matters connected with ordinary domestic life. The distinctions of caste are the most remarkable of these, and form indeed the characteristic mark of Hindoo society. Every one has heard that the Hindoos are divided into four great classes or castes, founded upon the great distinctions which prevail amongst all people in their first advance towards civilisation; that is, into priests, soldiers, traders, and labourers. As such, a distinction into tribes is natural, and indeed known to have existed among other people, it is highly probable that it prevailed with the first rude tribe or nation with which the Brahminical form of worship originated, and that it constituted the foundation of the present superstructure of the castes.

The first in rank among the four great classes, of course, is the Brahmin or priest; and next to him comes, very naturally, the soldier; at a great distance follows the industrious capitalist or trader; and far removed from all is the labourer. These divisions are hereditary, impassable, and indelible. Such is the theory of the distinctions of Hindoo society; but the practical and real distinctions are very different indeed. The attributes of the different classes, as they are described in the ancient books of the Hindoos, we may be sure never could have been practically in operation. These books, it must be recollected, were written by Brahmins who claimed an exclusive right to expound them, and all but the monopoly of reading them; and it was their interest to dwell on the immeasurable superiority of their own order; but it is hardly credible that any society should be able to hold together for a moment, in which laws such as we find in the

Hindoo sacred books were *bona fide* enforced. For example, it is enacted among myriads of the same sort, that if a labouring man sit upon the carpet of a priest, he shall be punished, either by having a hot iron thrust into his buttock, or by being branded, or banished the kingdom, or having the offending buttock cut off! Many, in fact, of the Hindoo laws appear to have been framed by the Brahmins more for the purpose of deterring, through the terrors of superstition and punishment, the other classes from interfering with their privileges, than for any other object. Whatever may have been the original attributes and privileges of the great classes, at their first institution, it is certain that these classes themselves can hardly be said at present practically to exist. In the advance of society, the increase of population, the extension of commerce and conversion, and the operation of the human passions, they have given way to a different order of things. They are referred to by the tribes into which Hindoo society is at present divided, as a matter of genealogy; some tribes claiming their pedigree from one or other of the original castes; their neighbours denying the authenticity of the claim, and setting up claims of their own; but the greater number of the people making no pretence to this purity of descent, for such it is considered even in its lowest ranks. In the most ancient Hindoo work extant, the *Institutes of Menu*, which has been computed to be about 2,700 years old, there already existed nearly a hundred castes, and it must be supposed that the enumeration was confined to that part of the country in which the work was written. The number of the castes not coming within the pale of the four great divisions, suggested the notion of the mixed castes, supposed to originate from an illegitimate intercourse between the four great orders, with the crosses which again sprung from these. This was clearly an afterthought—a new theory made for the occasion, and wholly inadequate to explain the actual state of society as we find it. This may be made sufficiently plain by a few examples. Among the 25,000,000 of people who speak the language of Bengal, there are none who even pretend to be of the second or third order, that is, of the military or mercantile classes: all who are of these two orders are comparatively recent immigrants from the north, and identified as such. In so far as the four great orders are concerned, the native inhabitants of Bengal consist, in fact, of Brahmins, and those who are not Brahmins. The Brahmins themselves consist here of two classes; viz. those who can trace their pedigree to the N. of India, and who are held in the highest repute, and of those who cannot,—far less esteemed. The Brahmins of Bengal, including all of both these classes, consist of no less than 168 subdivisions, claiming various degrees of purity, and not one of which will eat, drink, or intermarry with another! The next most important caste in Bengal is denominated Chysta, and is chiefly engaged in mercantile pursuits: this is the tribe whose name has been supposed by many to have furnished the English language with the word *caste*; but this is a mistake, for the term is simply the Spanish and Portuguese word *casta*, meaning race or lineage. They are reckoned pure Sudras, or persons of the original servile class, and amount to 83 subdivisions, equally unsocial among themselves with the Brahmins. Among the people speaking the Orissa language, the military order is altogether wanting, and there are but a few families generally reputed of the third class. In Malabar and Canara the second and third orders are wanting, the first of these being supplied by the military aristocracy of the Nairs, who are considered to be pure Sudras, or of the servile class, that is, of the class represented by the Hindoos as being in the last degree of degradation: they are, notwithstanding, the lords of the soil, and, before very recent conquest, the real sovereigns of the country. The celebrated Rajpoots, the most distinguished military order among the Hindoos, have, according to the Sanscrit writings, a vulgar origin; they are sprung from the mercantile classes on the paternal side, and from one of the most inferior castes on the maternal. All the warlike and conquering nation of the Mahattras, who are not Brahmins, are deemed to be of the fourth, or servile order. In every part of India there is a considerable portion of the inhab. who are utter outcasts, or, at least, beyond the pale of the Brahminical religion, condemned to this exclusion by their servile condition, their poverty, or the meanness of the employment in which they are engaged, the proportion of this degraded class being, contrary, perhaps, to what might have been expected, always found to be greatest in the least civilised parts of the country.

In the district of Dinagore, in Bengal, out of a Hindoo population of 800,000, it was found that 84 per cent. only were considered pure tribes, 464 impure, 184 very low, and 263 abominable. In Malabar, out of a population of 720,000, 100,000 are in a state of slavery, and treated by the Brahmins and Nairs as if they were hardly human. Even a great proportion of the free and industrious classes must not approach, owing to their alleged impurity, the person of a Nair nearer than a

prescribed number of paces, this Nair himself being, as already mentioned, the lowest of the original classes; a being, according to the ancient Hindoo writings, expressly created for the purpose of performing sacrificial offices to the Brahmins and other superior classes. What is still more remarkable, and the same thing obtains with respect to many other impure classes in the S. of India, the Brahmins refuse to afford them instruction or spiritual comfort: in fact, they are not of the Brahminical religion at all; never enter the Brahminical temples, or offer worship to the gods of the Brahmins; but have their own peculiar deities, priests of their own caste, and, contrary to the creed of the Brahmins, usually have no knowledge of a future state. The Brahmins, although they are to be found throughout India, and have a vast influence every where, are divided into more numerous families and varieties than any of the other classes; and while each is revered by its own immediate followers among the laity, they almost all hold each other in contempt as pretenders. They go the length of reckoning no less than 2,000 separate distinct families of their order. The order of the Brahmins composes the very essence of Hindooism: the Brahmin who lives by charity, or the voluntary contributions of the laity, and who performs the most common ritual of the Hindoo worship, is held in the highest repute. Next to him comes the Brahmin who lives by his industry and temporal employments, provided they be such as become the dignity of the order; but which commonly exclude holding the plough, and performing any of the manual employments of agriculture. The lowest rank of all is assigned to those Brahmins who perform the common ritual of the Hindoo worship; and among these last, the meanest office of all is that of performing the service of the gods in the temples. To exercise even the office of astrologer or village priest, is far more respectable. The service of the temples, indeed, has fallen into such disrepute, that the Brahmins in some cases have abandoned it to the inferior classes. Fastidiousness in respect to food is a characteristic mark of purity of caste, and no people ever carried this matter to so absurd and extravagant a length as the Hindoos. On this point the most essential thing of all is to abstain from eating the flesh of the cow. He who eats beef is no Hindoo, but is utterly contemptible. He who kills an ox by accident ought to be excommunicated; and he who kills one designedly ought to suffer death. This is perhaps the only religious precept which is of universal acceptance among all Hindoos; pretty much in the same way as an abstinence from the flesh of the hog is imperative upon all Jews and Mohammedans. The higher classes commonly abstain from eating the flesh of all domestic animals except that of the goat or sheep. Hindoos generally partake readily of almost all descriptions of game, the wild boar included. The impure classes and outcasts, a numerous body of the people in many parts of India, hardly reject any kind of attainable aliment, and devour, without scruple, such articles as carrion, rats, and river tortoises, that feed most impurely: the higher castes commonly eat but once a day, and a few of the most fastidious only when the sun is out; so that in cloudy weather they are occasionally put to very trying inconvenience. To abstain from spirituous and fermented liquors, and intoxicating drugs, is a general precept of the Hindoo religion; and the degree in which abstinence from them is observed marks the purity or impurity of the class. Brahmins and persons of the mercantile order generally abstain altogether from the use of spirituous liquors, while the impure classes and outcasts partake of them very freely.

The distinctions of caste, founded upon employments, though not always rational, is generally much more so than any others. The most honourable employment is that of the priesthood, provided the individual exercising it live on eleemosynary gifts, confine himself to giving instruction, and that that instruction be not given to any person of an impure caste, that is, to those who cannot afford to pay handsomely for it, which would be very discreditable. The military profession, and the wholesale mercantile profession, are almost equally honourable. Agricultural employment is creditable almost every where; its respectability being, however, somewhat impaired where slaves are numerous, and principally employed in the labours of the field. All the more ordinary trades, immemorably exercised by the Hindoos, are respectable in their way; such as potters, braziers, goldsmiths, weavers, and barbers. All trades or employments implying the death or destruction of animals, or of which the material is an animal substance, are either low or very impure; such as fishermen, washermen, hunters, snake-catchers, lime-shell burners, curriers, shoemakers, and butchers. Palm-wine drawers and distillers are impure, from the impurity of the objects they produce. Sweepers, washers, burners or buryers of the dead, and public executioners are utterly abominable, and indeed sheer outcasts. There are, of course, endless anomalies in this, as in every thing else connected with the Hindoo religion.

Bankers in Bengal, for example, rank below barbers. All professions which imply poverty in the parties exercising them are mean employments. Basket-making is a mean employment, and the precarious search for drugs and honey in the forests is also mean. Almost every employment above a handicraft trade is open to Brahmins, and of course to all that are below Brahmins.

It must not be supposed from what has now been said, that the tribes or families exercising each profession or trade are always the same; on the contrary, they differ in every province of India: even in the same province, two or three tribes, or a dozen tribes, may exercise the same profession or craft. In each family, trades and professions are generally hereditary, as a matter of convenience, as happens in all rude societies, but there is no impassable barrier between one profession and another; there is nothing that should prevent the son of a potter from becoming a goldsmith, or the son of a goldsmith from turning his hand to the loom, except that in particular situations the parties might forfeit some hereditary perquisite annexed to their employment by the change. Reckoning the entire British army in India, perhaps there is hardly a caste, or sect, or religion, which is not to be found in its ranks—from the purest to the most impure, and most abominable—in the most orthodox to the most heretical. Brahmins may there be seen commanded by Sudras; and men of pure castes may be seen in the ranks, with men of no caste for their officers. The Brahmins under these circumstances are as exemplary for their subordination as any other class; a satisfactory refutation, upon a large scale, of the fallacy and vanity of the pretensions set up for them in the ancient writings of the Hindoos, and maintained by some European commentators on those writings. The institution of the castes, as now described, is universal throughout Hindostan.

Other Forms of Religion.—These are the Jain, Buddhist, Seik or Singh, the Mohammedan, and Christian. The period or the place in which the first of these had its origin is unascertained: at present, it prevails chiefly in the great province of Gujrat and in Talaw², on the western shore of India, but it is to be found more or less scattered through every part of the country. The Buddhist worship originated in Bahar, within the great plain of the Ganges, and, according to statements which have a considerable air of probability, in the sixth century before Christ, or about 200 years before the expedition of Alexander. This form of worship, so prevalent in Ceylon, and in all the countries to the E. and N. of Hindostan, is nearly extinct in that country itself. Nanak, the founder of the Seik heresy, confined to the countries lying near to or amongst the five great tributary rivers which eventually constitute the Indus, was born in 1419; so that this religion is of little more than two centuries standing. The Mohammedan religion began to make some impression in India about the beginning of the 11th century, and the descendants of foreign settlers, or the converted nations of this persuasion, are at present supposed, for all India, to amount to about a seventh part of the entire population. It is remarkable that they are not most numerous in those parts of the country which were the seats of Mohammedan power, but rather at the extremities, such as the remote border provinces of Bengal, in which more plant materials for proselytism were found. The Christians abound most in the S. parts of India; the greater number are Nestorians, who are supposed to have embraced Christianity, through the labours of Greek missionaries from Syria, as early as the second and third centuries of the Christian era. Most of the remainder are Catholics, the descendants of Portuguese, or persons converted by Portuguese missionaries.

Population.—Of the whole territory of Hindostan, supposed to contain, as already mentioned, 9,300,000 sq. m., the population may be estimated at about 130,000,000, or about one half the population of Europe. The ratio of pop. to the sq. m. is therefore near 100 to 1; whereas that of Europe is very little more than 63 to 1. This pop. is very unequally distributed. The well-watered alluvial plains and valleys are every where thickly, and the mountainous or hilly regions always thinly, inhabited. From the extreme S. point at Cape Comorin, up to the 11th deg. of lat., the pop. is in some parts as low as 74 inhabitants to the sq. m.; at Madura, watered by the river Vay, it rises to 160; at Tanjore, watered by the Cavery, it rises to 225, being the densest pop. of the whole of the S. portion of India. In the Carnatic, or plain lying between the E. Ghauts and the sea, it is about 96. On the table-land between the Ghauts, and up to about the 16th deg. of latitude, where the land is high and dry, with little other than artificial irrigation, the rate drops to 72. In the narrow plain between the W. Ghauts and the sea, and from the 10th deg. of lat. up to the 20th, it is estimated at about 100. Of the whole table-land, extending from the 16th deg. of lat. up to the Vindhyan range, and S. border of the Gangetic plain, probably the pop. does not exceed 50 to the sq. m. The

pop. of the great peninsula of Gujrat rises to about 170. More than half the whole pop. of Hindostan is contained in the great plain of the Ganges: computing the area of this tract at 290,000 sq. m., and the pop. at 60,000,000, the average rate per sq. m. exceeds 200, which is a higher ratio than that of our own island. Within this wide range, however, there is a great difference in the rates of population. From the bottom of the Bay of Bengal up to the W. confines of Bahar, which comprises, of course, the tract of inundation, a territory of upwards of 80,000 sq. m. contains a pop. of more than 300 to the sq. m. The tract of inundation itself far exceeds this. Thus the district of Burdwan has a density of 593; that of Hooghly, 548; the districts of which Calcutta is the centre, 540; and that of Moorshedabad, above 400. As the country becomes mountainous to the E., the population diminishes. Thus Backergunge has but 450; Chittagong, 235; and Tipperah, 200 to the sq. m. In the low lands to the S. of Bengal, including Midnapore and Cuttack, the ratio is but 225. From the W. confines of Bengal to the confluence of the Jumna with the Ganges, the country is far beyond the reach of inundation, and although very fertile, the pop. is only at the rate of 220 to the sq. m.; but in this is included the large, hilly, and wild district of Rhamgur, which has no higher ratio than 100. The whole of the plain to the W., from the confluence of the Jumna till it terminates in the Great Desert, may be computed to have a density of population not exceeding 180 to the sq. m., and the proportion generally diminishes as we proceed westwards. The Punjab, or plain watered by the five affluents of the Indus, probably does not contain a pop. of more than 100 to the sq. m., and so would be a large estimate for the delta of the Indus. The extensive desert lying between the western limit of the Gangetic plain most probably does not contain 10 inhabitants to the sq. m.

History — The Hindoos, it is now fully admitted, have no history; they do not even possess any rational, connected, and authentic narrative of their own affairs for a single century. The oldest inscription found in Hindostan, and it is of doubtful authenticity, dates but 22 years before Christ: one of the most authentic era dates but 57 years before that of Christ; and another of extensive currency dates 78 years after Christ, the origin of both being buried in fable. The earliest of these dates is but three centuries before the invasion of Alexander, and about five centuries more recent than the commencement of authentic history in Europe. The temple of Juggernaut is but 640, and a ruin connected with it 1,142 years old, the latter being, however, a date which rests on tradition only. In so far, then, as history is concerned, had it not been for the companions and successors of Alexander, who describe the Hindoos as in many respects resembling what they are at the present day, we might for all that their own history teaches, be led to believe that they were not an ancient, but a comparatively recent people. Independent of history, however, there remains abundant evidence to show that the Hindoos had been very early civilised. The most remarkable, perhaps, is the existence amongst them of the literature of at least three languages, which have long ceased to be spoken by any living people. These are, the Sanscrit, a language of complex grammatical structure, like the Greek, Latin, or Arabic; the Sariawati, or Pracrit, a language derived from the Sanscrit, but of simpler structure, and bearing something like the relation to it which the Italian does to the Latin; and the Pali, a language also of a simpler structure, derived from the Sanscrit, but formed in a different part of the valley of the Ganges. The first of these is at the present day the sacred language of all who follow the Brahminical religion, as the last is that of those who follow the Buddhist worship, whether in India or beyond it. All these languages appear to have been dialects of people who lived in the upper portion of the valley of the Ganges. The Hindoos and their ancient writings point very distinctly to the territory lying W. of Delhi, on the right bank of the Jumna, the principal affluent of the Ganges, as the seat of the people who spoke the Sanscrit. There are certainly many arguments in favour of the belief that the Brahminical worship originated in this quarter, and that the nation that propagated it, and spread civilisation over India, inhabited this country. Thus, the upper and elevated portion of the plain of the Ganges is as much the principal scene of all the great events of Hindoo mythology as Greece was of those of the Greek mythology. Here are the scenes of the wars of the Mahabarat, of the kingdom of Rama, of the localities of the adventures of Krishna, Madanapura, Ayodha, and Mathura. The principal holy places are also here; as Gya, Allahabad, Benares, Hurdwar; not to mention the great Ganges itself, the Jumna, and their sacred tributaries. The evidence afforded by language and religion tends to corroborate this supposition. Thus, the Sanscrit most abounds, and exists in greatest purity in the dialects of

the upper portion of the valley of the Ganges, and gradually diminishes both in amount and purity in proportion as we recede from it to the E., and particularly to the S. The distinction of castes is also most strongly marked in this quarter, and diminishes as we recede from it, as already mentioned. The country itself, also, it may be added, from its fertility, salubrity, and freedom from rank vegetation and forest, must at all times have been more favourable to the development and progress of an early civilisation than any other portion of India. Although the incursion of Alexander (B. C. 329) made India known to the European world, its effect upon the people of India was scarcely greater than that of any one of the thirteen expeditions of Mahmoud of Ghisnee. It is highly probable, however, that the influence of the kingdom which his successors established in Bactria, and which lasted for 130 years, was much greater. The Greek princes of Bactria appear to have conquered several of the N.W. provinces of India; and from this source, in all likelihood, the Hindoos derived their knowledge of astronomy. The real history of India commences with the first Mohammedan invasion, in the year 1000, between 18 and 14 centuries after the invasion of Alexander. The hero of these invasions, for there were thirteen of them, was Mahmoud, sovereign of Ghisnee, in Afghanistan, the son of a man who had been a Turkish slave, but who had raised himself to sovereign power. Mahmoud pushed his conquests, or rather incursions, as far as Canoge, Bundelcund, and Gujrat. India was at this time divided amongst many sovereigns, most of them petty ones; and the resistance made to the conqueror was hardly more formidable than that which the Americans offered to the Spaniards. Towards the close of the 13th century, the Afghans made their first appearance on the theatre of Indian history. A chief of this nation, the district of Gaur, raised himself to independent sovereignty; and while the Turkmans seized upon the provinces of the Ghizidan empire, he and his successors seized upon the capital and its eastern provinces, while the second prince of the race, Mahomed Gauri, invaded Hindostan. His favourite general, Cootub, originally a Turkish slave, pushed the Afghan conquests as far as Gujrat; and Mahomed dying without children, Cootub seized upon the Indian conquests of his master, and fixed the seat of his government at Delhi in the year 1193. This may be considered as the date of the first effectual conquest of Hindostan. From this period down to 1028, or in 323 years, twenty-six Afghan princes reigned in Delhi. But it is not to be supposed that the Delhi sovereigns of this race ever ruled over all Hindostan; for in the Deccan, Gujrat, Malwah, Junpore, and Bengal, there were independent Mohammedan princes, who conquered, and ruled for themselves, and many Hindoo sovereigns continued unsubdued. During the reign of the Afghan princes of Delhi, in 1298, Timour invaded India, but his expedition was a mere plundering incursion. In 1525, India was invaded by Baber, the fifth in descent from Timour, and the sovereign of the little principality of Firghiana, territories lying between the Pamir mountains and river Jaxartes to the S., and Kashgar and Samarcand to the E. and W. He had first conquered Cabul and Candahar, and from the first of these entered Hindostan, defeated and killed the last Afghan sovereign, and seated himself on the throne of Delhi. With him began the race of princes, improperly called Mogul by Europeans and Indians, for neither Baber nor his ancestor, Timour, were Moguls, but Turks. All the conquerors of Hindostan, in fact, who were not Afghans, were Turks, or natives of the great province or kingdom of Transoxiana, whose native tongue was Turkish. Neither were any of them Persians, though the language of the latter people, being a more cultivated tongue than their own, was adopted by both the Turkish and Afghan races of princes. It will be observed that the last Mohammedan conquest of India, took place 27 years after Vasco de Gama found his way to that country. The Mogul empire was consolidated under Aurungzeb, who died in 1707, and it began to decline immediately on the death of his son and successor, in 1712. The Mohammedan power acquired its greatest extent under Aurungzeb; but even under him, it was much inferior, not only in resources but in extent, to the empire now held by Britain in the same country. The passage by the Cape of Good Hope opened the way to a new and more formidable race of conquerors. The Portuguese, by whom it was effected, never acquired more than a petty territory on the W. coast; and the continental acquisitions of the Dutch were limited to a few commercial factories. The French, at one time, seemed to be on the high road to the establishment of a great Indian sovereignty; but, in the end, they were completely worsted, by the greater resources and superior maritime strength of the English, and by the extraordinary talents, courage, and enterprise of Clive. Our first territorial acquisition consisted of a patch of 6 sq. m. of land on the Coromandel coast,

where Madras now stands. The real foundations of our Indian empire were laid in the interval between 1780 and 1785, when Clive defeated the lieutenants of the Mogul, and the Mogul himself, and acquired Bengal, the richest of all the Indian provinces, the most easily defended, and that which has afforded us, throughout, those resources which have enabled us to conquer and to preserve all our subsequent acquisitions.

Political Divisions.—The following estimate of the area and population of the different states into which Hindostan is divided will give the reader a tolerable notion of the political division of the country:—

	Area in sq. m. (Eng.)	Population.	Pop. to sq. m.
Paramount State.			
British Dominions -	612,875	85,475,417	-
Tributary States.			
Tevancore and Cochin -	8,400	1,407,789	149
Nizam's Dominions -	108,400	9,355,929	86
Mysore do. -	39,750	2,314,692	77
Oude do. -	25,300	4,103,866	162
Scindia do. -	48,400	6,627,837	86
Berar do. -	64,470	5,774,554	86
Holkar do. -	17,600	1,626,262	86
Gulowar do. -	86,900	3,220,575	66
Goa do. -	3,950	189,555	58
Kurnool do. -	3,500	272,763	77
Sikhim do. -	4,400	165,038	57
Bhopal do. -	7,560	628,590	86
Sattarbh, Calapoor, &c. -	21,600	2,376,000	110
Cutch do. -	6,100	205,121	33
Handicand Chiefs -	19,000	638,900	33
Rajpoot States, &c. -	165,000	5,546,451	53
	561,610	41,274,092	
Independent States.			
Nepaul -	58,000	2,000,000	37
Lahore -	60,000	4,000,000	66
Sinde -	24,000	1,000,000	41
	137,000	7,000,000	
Paramount State (British)	612,875	85,475,417	162
Tributary States -	564,610	41,274,092	73
Independent States -	137,000	7,000,000	61
Total	1,214,485	131,751,509	108

It will appear from this statement that the British government possesses about 42 parts in 100 of the whole area of India, its tributaries about 46 parts, and the independent states but 12 parts. England and her tributaries, in fact, possess 88 parts out of 100 of the whole of India. The amount of population is much more in favour of the British dominions, which contain twice as many inhabitants as the tributary, and about twelve times as many as the independent states. The density of pop., as expressed in the third column of the table, is an index, to a certain extent, of fertility of territory, and of favourable position. The British dominions, tried by this test, are twice as populous as the tributary, and more than three times as populous as the independent states.

Resources.—The public revenues of India are derived from the land-tax, or rather from the appropriation, by the sovereign, of a very large portion, and often, indeed, of the whole rent of the land; from taxes on houses, arts, and professions; from customs and transit duties; and from fees and fines. All other taxes are inconsiderable in comparison with the land-tax, which, in every native state, constitutes about 95 parts in 100 of the entire public income. Under the British government, it amounts in round numbers to 12 millions sterling. If it bore the same proportion to absolute population, it would in the tributary states be nearly 6 millions, and in the independent states nearly 1 million. This is by no means likely, however, to be the ratio, and the probability is, that the land-tax follows the proportion of the relative density of population. On this hypothesis the land-tax of the tributary states will be about £700,000, and that of the independent states about £300,000; adding 10 per cent. to the two last for other taxes, and knowing from positive data what the whole revenue of the British government is, we may make an approximate estimate of the entire public revenue afforded by the people of India, and state it in round numbers:—

British territories -	£17,000,000
Tributary states -	3,000,000
Independent states -	350,000
Total	£20,350,000

These results, which are probably not very wide of the truth, while they partially exhibit the relative resources of the different political parties, exhibit, at the same time, the essential poverty of the Indian people. Notwithstanding that every thing is taken from them that it seems practicable to take, they do not contribute half the sum that is contributed by the inhabitants of this kingdom, though not amounting to a fifth part of their

numbers. With an oppressive system of taxation, the Indians are barely able to contribute 3s. a head, while the inhabitants of the United Kingdom contribute, with infinitely greater facility, twelve times that amount!

Languages.—It has been stated, that there are no fewer than 25 native languages spoken throughout Hindostan, independent of the dialects of tribes in a very rude state of society. "The extensive region," says Mr Colebrooke, "which is nearly defined by the banks of the Saraswaty and Ganges on the N., and by the sea to the E. and W., contains, according to some, 87 provinces, and, according to others, 84, and each has its peculiar dialect." The Hindoos of the N. portion of Hindostan are acquainted with three dead languages, viz. the Sanscrit, the Saraswaty, or Pracrit, and the Palli. Of these three the Sanscrit contains internal evidence of being the oldest. It was the language of a people who, according to a very probable Hindoo tradition already referred to, occupied the right bank of the Jumna, a little way to the N.W. of the city of Delhi, and with it probably originated the Brahmintal religion, and the first dawn of Hindoo civilisation. The Saraswaty or Pracrit was the language that succeeded it in the same country, and it seems to bear the same sort of relation to it that the Italian does to Latin. The Palli is a language which sprang up in the province of Bahar. Of this, also, the Sanscrit forms the groundwork, and the relation between them may be supposed to bear a similar relation to that which subsists between the Spanish, or French, and the Latin tongue. With the people speaking the Palli language sprang up the religion of Buddh; and Palli is, to the present day, the sacred language of all the Asiatic nations who have Buddhism for their national worship. The evidence of these three languages, that have successively ceased to be spoken, affords, as before observed, satisfactory evidence of the great antiquity of Hindoo civilisation. One or other of the languages in question is more or less mixed up, not only with every language of Hindostan, but also with the languages of most of the neighbouring countries. To the N. they form the groundwork of these languages, as Latin does of Italian; to the S., on the contrary, they are engrafted on the language in something like the manner in which the French is engrafted on our own Saxon tongue. The literary Hindoos reckon that there are ten cultivated languages, having a written character and a literature, viz. five to the N., called the *five Gauris*, and five to the S., called the *five Dravirs*. The enumeration, however, is not very clear and distinct, at least as applicable to present times. The *Gauris* are the Saraswaty, Canoj, Gaura or Bengalee, Mathila or Tirutiya, and the Oorissa. The first of these is the dead language already mentioned. The Mathila is confined to a small portion of the district of Tirhoot, the Gaura is the language of the numerous people of Bengal, already mentioned, and the Oorissa or Urya, of the people of Catjack. The Canoj, as such, is an extinct language, but is considered, on good grounds, to be the parent of the modern Hinduee, the most cultivated and generally spoken of all the native languages of Hindostan. Upon the language of Canoj has been grafted the Persian, the court and literary language of the Mohammedan conquerors of India. This language, in fact, is found to exist in the Hindoo, very much as the French is found in our own Saxon tongue, its introduction having been effected exactly in the same manner. Besides the local language of each district, the Hinduee is commonly spoken by all persons of education throughout all parts of India, and almost universally by all persons of the Mohammedan persuasion. Its prevalence, it may be observed, is probably owing as much to the parent language having been, previously to the conquest, the language of a numerous and powerful nation, as to the subsequent influence of the conquerors. Without this supposition, it is difficult to believe that, in the comparatively short period which elapsed from the first permanent conquest of the Afghans, at the end of the 12th century, until it acquired its existing form, it should have acquired so wide an extension as it is found to possess.

The five Dravirs are the Tamil, called by Europeans, very improperly, the Malabar; the Maharashtra or Mahratta; the Karnata or Canara; the Teluga or Talugu, improperly called by Europeans, the Gentoos; and the Gujrat. The groundwork of all these languages is peculiar; but upon all of them is engrafted more or less of the Sanscrit language, or its derivative, the Pracrit; the amount of word-decreasing, as we proceed S., until, in the ancient Tamil, it disappears altogether. The Tamil, the Teluga, and the Canara are divided into two dialects, an ancient and a modern; the first containing the national literature, and being nearly unintelligible to the people at large.

Besides these more cultivated tongues, there are at least 20 more uncultivated languages, which are not so highly polished as the former. Sir James Mackintosh has pointed out this resemblance in his "Epitome of the History of England."

least 20 languages spoken by nations tolerably civilised, and of considerable numbers, as the Assami, spoken in Assam; the Nepali, Rosali, and Dogari, three languages spoken in Nepal; the Cashmiri, spoken in the celebrated valley of Cashmere; the Punjabi, spoken in the country of the five affluents of the Indus; the Multani, the dialect of the prov. of Multan; the Sindhi, spoken by the Sindhians at the mouth of the Indus; the Bikaneri; the Marwari; the Jayapuri; the Odeputi, four languages spoken in Rajpootana; the Haruti; and the Braja, spoken in the higher portions of the valleys of the Ganges and Jumna, and derivatives of the Saraswaty or Pracrit; the Magadhi, spoken in the S. portion of the prov. of Bahar; the Malwa, spoken in the prov. of the same name; and the Bundela, spoken in the prov. of Bundicund. Many of these languages are in course of gradual extinction and absorption by the Hindue, as the Celtic dialects of our own country are in progress of extinction by the English; the Armorican by the French, and the Basque by the Spanish. To the S. we have the Konkani, the language of the Concan; the Tulawa, or language of the country which Europeans call Canara; and the Malayalam, spoken by the inhab. of the S. portion of coast lying below the W. Ghauts, as far as Cape Comorin.

Of the languages of rude or savage tribes, such as the Garrows, Coolies, Cattles, Gonds, Coles, &c., not less than 30 may be easily enumerated. Besides the three dead languages, one of them, the Sanscrit, as much studied as Latin in Europe, there are in India eight languages, each spoken by a numerous pop.; 20 spoken by people less numerous, but still civilised; and at least 30 spoken by rude tribes; making in all 68 living languages. This simple fact may satisfy us at once that all India never was subject to one government, or never even thoroughly united in large masses. To the native languages now enumerated must be added the Persian, still as much studied, and much more generally written, than Latin in Europe; the Arabic, often studied, from religious motives, although not spoken; the Portuguese is a good deal spoken on some parts of the maritime coast, especially by the converts to Christianity; and the English, which has begun to make considerable progress.

Literature.—The best and largest portion of Hindoo literature is contained in the dead Sanscrit; that which is contained in the seven living languages already enumerated being for the most part little else than translations, or rather paraphrases, from it. To Hindoo literature in any language, prose composition is hardly known. Every thing is in verse, from works of imagination to history, to treatises on theology, astronomy, medicine, grammars, and even dictionaries. These facts are at once evidence of antiquity and of rudeness, while they show that, for 2,000 or 3,000 years at least, native literature has made little progress. The Hindoos have been said to be, at the present moment, in the condition, in reference to literature, of the Europeans of the middle ages; who had no books but such as they inherited from the Greeks and Romans. But it is obvious that they are in a much worse condition, inasmuch as their models are incomparably inferior. The two most celebrated works of Hindoo literature are the Mahabarat and the Ramayana; the one giving an account of the wars of the sons of Bharat, and the other the adventures of Rama, king of Ayndhya or Oude, a supposed incarnation of Vishnu, the Preserver of the Hindoo Triad. The scene of both is laid in the upper portion of the valley of the Ganges. Mr. Mill's description of these poems, some of the best specimens of which have been translated into English, is not unjustly depreciatory:—"These fictions," says he, "are more extravagant, and more unnatural, not only less correspondent with the physical and moral laws of this globe, but, in reality, less ingenious, more monstrous, with less of any thing that can engage the affection, awaken sympathy, or excite admiration, reverence, or terror, than the poems of any other, even the rudest, people with whom our knowledge of the globe has yet brought us acquainted. They are excessively prolix and tedious. They are often, through long passages, trifling and childish to a degree, which those acquainted with only European poetry can hardly conceive." (*History of British India*, i. 362, 4to. edition.)

Science.—The sciences in which the Hindoos have made some progress are, arithmetic, algebra, geometry, and astronomy. The first and second are probably the only ones in which, perhaps, they are entitled to lay any claim to originality. They are probably the inventors of the system of notation, which the Arabs borrowed from them, and we from the Arabs. It is not necessary, however, to add that the Hindoos are clumsy arithmeticians; and that, as in the case of gunpowder, certainly invented in China, it is in Europe only that the art has been perfected.

In geography, medicine, botany, and the physical sciences generally, the Hindoos, like other Asiatic na-

tions, may be considered as profoundly ignorant. In metaphysical and ethical speculations, more common to the genius of such a people, they have indulged to a much greater degree; and their speculations in grammar, especially, if not distinguished for utility, are remarkable for ingenuity. The Sanscrit language, distinguished for the complexity and variety of its structure, has afforded an ample field for such discussions. It may be remarked that it is the only one of the languages that is subjected to rules, and that they have never composed a grammar of any of the living languages. Geography, another science, the invention of which is ascribed to the Hindoos; but their earliest treatises are of the 7th century, 1,000 years after they had been in contact with the Greeks of Bactria, and at least 15 centuries after the first knowledge of the science in Greece itself. In astronomy, the Hindoos make large claims to antiquity, reckoning their tables from the commencement of the Call-yuga, or iron age of the Hindoo mythology, 3,102 years before Christ. Of such an antiquity, however, there are great doubts; and the more general opinion seems now to be, that the astronomy of the Hindoos was either derived from the Bactrian Greeks, or intermediately from the Arabs of the middle ages. The coincidence between it and the Greek astronomy, is at all events, both remarkable and suspicious. Thus, the days of the week are seven in number, and named after the seven planets; while they follow in the same order as they do in the Greek. The ecliptic is divided, as among the Greeks, into 12 signs, with the same names, emblems, and arrangement; and the signs are also divided into 30 degrees. As these matters are purely arbitrary, they cannot but have had the same source. Two things seem to be agreed upon by all parties; viz., that the Hindoo astronomy is empirical, and not founded on general principles; and that, among the Hindoos, astronomy has only been used as an auxiliary to astrology, and never applied to any useful practical purpose; with the exception, and this in a very rude manner, of reckoning time.

Arts.—The arts in which the Hindoos have made the greatest progress are, agriculture, weaving, dyeing, and architecture. The ox, buffalo, horse, ass, elephant, hog, dog, sheep, and goat have been domesticated, and used by the Hindoos from the earliest antiquity. The camel, probably, has been equally long known in Upper Hindostan. The common poultry is also of great antiquity among the Hindoos; and is supposed, and most likely with good reason, to have spread from them to the W. world. The buffalo and ox only are used for agricultural purposes; the horse generally for war or pleasure, now and then for burthen; the elephant for pleasure or burthen; the camel and ass, with few exceptions, for burthen only. With the exception of the horse, camel, sheep, and goat, every one of the animals above enumerated are still found in many parts of India in wild state. The agricultural implements used by the Hindoos are simple and rude, such as might naturally be expected among poor occupants, cultivating each a small patch of land upon an uncertain tenure; and the process is equally rude. It should however be observed, that neither the one nor the other are so much inferior to those of the S. part of Europe as a native of this country, accustomed to the more perfect implements and processes of English husbandry, would expect to find them. The greatest exercise of the skill and labour of the Hindoos in agriculture is displayed in works of irrigation; and the reader will not be surprised at this, when he understands that through means of irrigation the produce of the land is, according to circumstances, always multiplied never less than five fold, and often as much as ten. The works for this purpose consist of immense embankments, reservoirs or tanks, and wells. The delta of the Ganges, and the celebrated mound of the Cavery in S. India afford examples of the first description of works: reservoirs or tanks are sometimes of vast extent, and capable of converting 4,000 or 5,000 acres of what is often a dreary desert of sand into productive corn fields: these are most frequent in S. India. Wells, which are often sunk to the depth of between 300 and 300 ft., afford the principal means of irrigation in the upper portion of the valley of the Ganges. In a few cases there exist canals for irrigation resembling those of Lombardy, but these are of Mohammedan, not Hindoo, origin.

The articles cultivated by the Hindoos from very early times, are wheat, barley, rice, millet, several pulses, the sugar-cane, sesame, mustard, the cocoa, areca, and other palms; cardamoms, ginger, black pepper, cotton, the mulberry, indigo, madder, the mango, and the banana. From the Mohammedans they received the vine, the fig, the apple, peach, and pear; the pomegranate, limes and oranges; the carrot, onion, and melon, with the opium poppy. From Europeans they have received maize, oats, common potatoes, the batata, or sweet potato, the ground pulse, or arachis, the capsicum, guava, and pineapple, by way of the shade-tree, from Java; the tiliac, from China; and most of the common pot-herbs, direct from Europe. The sugar-cane is most probably a

native of Hindostan, and the art of manufacturing coarse sugar from it is traced by the etymology of the word *goss*, to Bengal. The art of granulating sugar, and separating it from the molasses, was most probably introduced into India from China, as the name of the commodity *China*, would seem to imply. The art of candying or crystallising sugar, the only mode of refining practised in the East, was taught the Hindoos by the Mohammedans, who themselves appear to have first practised the art in Egypt, as the name of the article *Mahri* (that is, Egyptian), would seem to import.

The Hindoos have made a far greater progress in the art of weaving, than in any other. It was confined to materials which their country either produced in great abundance, or of great excellence; or of which, in fact, in ancient times, they may be considered to have possessed nearly a monopoly, viz. cotton, silk, and the hair of the Tibetan goat. With the exception of silk, which they had in common with China, India may be considered as the native country both of the material and manufacture of the others. The cotton-plant is grown almost every where, from the S. extremity of India up to the valleys of the most N. range of the Himalaya, and it may be traced from India to every warm colony by its original Sanscrit name. The quality and nature of the fabric varies every where with the quality of the plant; and hence a vast variety of fabrics, known by the names of the districts producing the raw material: thus, the fine textures known in Europe as Dacca muslins, were produced only in that district, in which is cultivated, within narrow limits, a variety of the plant, with a staple remarkable for fineness and beauty, not found any where else.

Silk weaving, like that of cotton, is an art which has been practised from remote antiquity in India. In the Sanscrit language there is a peculiar name for the class of persons exclusively employed in the feeding of silk worms. The variety of the latter bred in India differs from that of China and Europe; and the species of mulberry grown for the food of the worm is a distinct one from that used either in Europe or China. But as the Hindoos are much inferior in skill and ingenuity to the Chinese, the silk fabrics of Hindostan have never equalled those of China; nor is the raw material, even now, equal to that of the Chinese, though under the superior care and skill of Europeans. The Cashmerians, the manufacturers of the well known shawls which bear their names, are descended from genuine Hindoos; and though the shawl goat be not a native of their country, they were the nearest civilised people to the rude nomadic tribes, to whom it belonged. They naturally, therefore, became the manufacturers; and the invention of the shawl manufacture may, therefore, be fairly ascribed to the Hindoos. From these statements, it will appear that the discoveries now described, and the progress in manufacturing industry which they imply, are rather owing to the accident of position than to any superiority of skill and ingenuity. This is at once apparent, by the little skill which the Hindoos evince in arts, where they possess no superiority in the raw material, as in woolen textures, iron fabrics, and earthenware, in respect to which there are few nations ruder and more unsuccessful. Orme, who is followed by Mill, ascribes the superiority of the Hindoos in the manufacture of cotton fabrics to the peculiar softness and delicacy of the Hindoo hand; but this is a fancy for which there seems to be no ground whatever. The Hindoos, comparing them with other nations in the same state of society, and to Europeans until comparatively recent periods, had attained considerable skill in the art of dyeing, producing colours that are both fast and brilliant. Here also, however, they had several advantages of the same nature as those already described, such as the possession of indigo, lac, and madder, three of the finest and most durable of all known colouring materials. Inferior dyes, such as the carthamus, morinda, turmeric and sapan, are also natives of the country. Their dying processes, however, have always been, and are, tedious, operose, and empirical.

Nearly the whole architecture of the Hindoos which deserves notice is dedicated to religion. The people have always lived in huts, and even their chiefs and princes were satisfied with very mean accommodation; and the only palaces have been those of the gods. But their temples are more distinguished for magnitude, the substantial nature of the materials, and the elaborate character of the ornaments, than for beauty, grandeur, or propriety. Many of the most remarkable consist of caves, or subterranean grottoes; and the rest have, for the most part, a pyramidal form. One class of religious monuments which makes so conspicuous a figure in the architecture of Christians and Mohammedans, is wholly wanting among the Hindoos,—those erected in honour of the dead; a circumstance no doubt arising from the universal practice of burning the corpse, and the belief in the doctrine of the metempsychosis.

Of a far higher order is the architecture introduced into India by the Mohammedans, particularly since the time of the Turkish dynasty, the descendants of

Timour. These consist of mosques and mausoleums, in the style of architecture introduced by the Arabs into Spain; and are so remarkable for beauty and chasteness of design, grace of proportion, and excellence of material and workmanship, as to be entitled to be compared with the finest remains of Grecian or Roman art. In these Mohammedan buildings, white and coloured marbles are largely employed, a material never seen in any Hindoo building, though very abundant in many parts of the country. The most remarkable of the Mohammedan monuments, well known to Europeans by the name of the Tajmahal, is situated near the city of Agra, on the right bank of the Jumna. It is a mausoleum occupying, with its gardens, a quadrangle of forty acres; the principal building, with its domes and minarets, being almost wholly of white marble. This was built by the Emperor Shah-Jehan, about two centuries ago. Even the palaces of the Mohammedan princes, and the houses of the omrahs were built in very superior style to those of the Hindoos of the same rank. In fact, the Mohammedan architecture exhibits unquestionable evidence of superior science, taste, and civilisation.

In useful architecture, such as the construction of roads, bridges, and public accommodation for travellers, the Hindoos have made very little progress, as may be seen by an examination of the more S. portion of India, which Mohammedan influence hardly reached. The ancient Hindoos were unacquainted with the arch, and hardly ever built a bridge of any sort. Down to the present day the principal rivers of the Deccan are crossed on wooden floats, or in baskets covered with leather. Now and then a few miles of good road lead to some celebrated place of pilgrimage, and on the ways leading to such places inns for the accommodation of travellers, called *choultrys*, are not infrequently met with. These consist of bare walls and a roof, without food, furniture, or attendance. Both these roads and inns have been constructed from religious motives only. In this department of architecture, also, the Mohammedans have made considerable improvements: the only bridges existing in India are of their construction; and the same thing may be said of public roads.

Effects of British Rule.—The great body of the Indian people had, for six centuries before the commencement of our government, been under the dominion of foreigners; and of foreigners more energetic than themselves, and a good deal more civilised. Upon a fair retrospect of what they have lost and gained by the Mohammedan dominion, they must, upon the whole, be considered as having been considerable gainers. The conquerors being Asiatics, and approaching to the native inhab. in complexion, manners, customs, and state of civilisation, assimilated with the latter, and, to a certain extent, adopted their language and customs. Even in matters of religion, where the difference was widest, a considerable share of toleration was established; and Hindoos, converts to Mohammedanism, and mixed races were in time admissible to the highest offices of the state, and not infrequently promoted to them. This condition of things was superseded by the British rule, which may now be considered as having been practically constituted for a period of about eighty years. The British government, as established in India, and as it is now in operation, may be considered an enlightened despotism, a good deal controlled by the public opinion of Englishmen on the spot, and to a smaller extent by parliament and public opinion in England, and possessing some advantages over, but also many disadvantages which did not belong to, the Mohammedan government, which it superseded. It may be divided into three periods, the first being that which intervened between the victory of Plassy in 1757, and the first effectual interference of parliament in 1784, but not practically enforced till 1793, an interval of 36 years. This was a period of pretty general anarchy, accompanied by constant, or at least frequent wars. The government was carried on upon the principles of the Mohammedan system, and did not pretend to be bottomed upon any other. The taxes were levied with more than Mohammedan rapacity; and the administration of justice followed the Mohammedan law with less than Mohammedan indulgence. But the modification in any of these particulars depended wholly on the moral and intellectual character of a few public functionaries. At the same time the industry of the country was subjected to a commercial monopoly, exercised by the government itself, and the aim of which, as of all similar institutions, was to obtain possession of as much as possible of the produce of the country at less than it cost, and to sell it for more than it was worth. It cannot be supposed that the British government during the period in question could possibly be productive of beneficial results to the native inhab. of the country; and it certainly produced none to the parent country, whose resources were wasted, and whose commerce was not augmented, by the possession of India.

The next period of our administration embraces the

twenty years from 1798 to 1813. During this time the land tax, the greatest burden of the Indian people, was established in perpetuity throughout the greater part of the Indian territory. Regular courts of justice were instituted, and the judicial and fiscal administrations were carefully and completely separated, after the example of European nations. The commercial monopoly continued as in the previous period, but it was exercised with greater leniency and forbearance, except in so far as concerned the settlement and resort of British subjects to India, the laws against which were more rigorously carried into effect than ever. Parliament never effectually interfered in the affairs of India during this period; every thing was presumed to be going on prosperously. The wars that were carried on in India in the meantime nearly doubled the extent of our territory, and raised the territorial debt to 30,000,000 sterling. But instead of reaping any direct advantage from these acquisitions, parliament was obliged, on the lapse of the charter, to exonerate the E. I. Company from a long arrear of a tribute of about half a million sterling a year, which it was wholly unable to pay. The entire advantage conferred upon the people of India, during the period now mentioned, resolves itself into the permanency of the land-tax, with some ameliorations in the administration of justice, and freedom from foreign aggression and invasion. The English nation derived no benefit whatever from India; our commerce with it, which was but of trifling importance, continued stationary; we paid a monopoly price for every Indian commodity we consumed, and were obliged to forego the whole of the paltry tribute we had bargained for.

The third and last period commences in 1814, and comes down to the present time. In 1814 the Indian trade was, in a great measure, thrown open; and in 1834 the last vestige of monopoly, and even the company's commercial character, was finally put an end to,—a measure which, with some drawbacks, has been productive of much advantage both to the people of India and of England, though in a greater degree to the latter. The exports of India to this country have more than doubled; and the people of India and of England respectively receive each other's productions for about one half to a third part of what they cost them under the monopoly. The influx of Europeans into India since 1814 has been followed by a great influx of British capital; and something like a public and independent opinion has sprung up at the principal seats of commerce, to control the despotism of a virtually absolute government. This public opinion finds a voice in a press formerly under a rigorous censorship, but now thrown open, and which employs itself greatly to the advantage both of the governors and the governed, in the exposure of public and private abuses. A system of effectual native education may be said to have begun in 1814; and the natives inhabiting the principal towns, who before considered all education to be comprised in the study of the Persian, a foreign language, or of the Sanscrit, a dead one, have betaken themselves with great ardour to the study of the language of the conquerors; and have, in many cases, made an extraordinary progress in the knowledge, not only of our language, but of our literature. What is wanted in India is not a system of education that shall make the people acquainted with the niceties of Sanscrit grammar, but a system that shall communicate to them the elements of useful knowledge, and that may pave the way for their emancipation from the gross prejudices and superstitious observances by which they have been so long enslaved. We doubt, however, whether this can be done by instructing them in English. It is true that English schools have been extraordinarily successful in Calcutta, and other large towns; and the proficiency of many of the natives in our language and literature is far greater than could have been rationally anticipated. But though so means should be left untried to extend instruction in English, still we have no idea that it can ever be diffused generally throughout the country, or be made to exert any powerful national influence. To bring about the regeneration of India, the better way, as it appears to us, would be to have primary school and other elementary books compiled in the languages of the different provinces, and to introduce them into the native schools and seminaries. This plan, though it would not introduce the language of England, would do what is of still more importance; it would introduce the rudiments of European science and literature, and would apparently be the most powerful means for promoting the improvement and civilisation of the natives that it is possible to bring into the field. (The latest and most authentic information with respect to education in India, may be found in Mr. Trevelyan's excellent work on that important subject.)

Since 1814 may also be dated the abandonment, on the part of many of the most wealthy and enlightened inhabitants of the towns, of the gross superstitions of the forefathers, and the adoption of rational opinions in matters of religion; and it may be remarked as extraordinary, that this species of conversion has been most frequent with the

Brahminical order, where we should least expect to find it. Commerce, in fact, the great engine by which civilisation, as well as improved morals, have been produced in Europe, has begun to do its work in Hindostan also. The value of knowledge and of character has begun to be felt, and already there may be counted among the merchants of Calcutta, Bombay, and other places where commerce is carried on upon a large scale, Hindoo, Mohammedan, and Parsee merchants, as faithful to their engagements, and of as strict probity, as any community can boast of.

The disadvantages of our position for carrying on the administration of India are sufficiently obvious. Ours, in the first place, is not a national government, nor is it as yet a government carried on by conquerors who have made the slightest progress towards naturalisation or amalgamation with the party governed. We are aliens in blood, in manners, in language, and in religion, carrying on the administration of 80 millions of people, and exercising a control over 50 millions more, at a distance of 12,000 m. The local government is purely vicarial, and the essential administration rests with men residing at a vast distance, who never saw the country, and who have no accurate knowledge of its manners and institutions. These men themselves are perpetually changing, and look upon Indian affairs as matters of very secondary importance to domestic and European politics. The local governments, instead of being responsible to the central administration, are themselves only very amenable for their acts to their political friends in Europe, while the affairs of India are too complex, too extensive, and too remote, to be understood by, or, for the most part, to excite any interest in, the people and parliament of England. In India, generally, the acts of the local government are secretly prepared without consulting or attempting to conciliate the parties for whom the laws are made.

One of the great disadvantages of the British government in India is the vast expense at which it is conducted, and the consequent weight of taxation to which the people are necessarily subjected. In India there are five local governments, and in England two departments whose administration the government, all of which are paid for out of the Indian revenue, on a scale of expense of which the rest of the world affords no example. Thus the salary of the governor-general is equal to five times that of the first lord of the treasury, while an Indian secretary is more highly paid than an English secretary of state. There are about 1,000 civil officers engaged in the judicial, magisterial, and fiscal administration of India, every one of whom costs the Indian people, including his pension on retirement, more than a puisne judge of the Court of King's Bench costs the people of England. As we maintain our dominion not through the affections and goodwill of the people, but partly through their docility, and partly by the sword, a vast army of 200,000 men becomes necessary. Thirty thousand of these must be carried over the Atlantic and Indian Ocean, and mortality included, are maintained at double the expense of the same force in Europe. The officers of the whole Indian army amount to about 5,000, and these, retiring pensions included, cost about three times what the same number would cost in Europe.

It is not, however, to be supposed, that the large salaries allowed to those engaged in the administration of the Indian government originate in extravagance merely. It may, in fact, be doubted whether it be possible, on any reasonable ground, to make any sensible diminution in their amount; and whether the excess that might be deducted from some departments should not go to balance a deficiency in others. The salaries of Europeans in India must be high; first, because of the expensive style of living in the country, and the immense number of servants and retainers that a person in any prominent situation must keep; and second, because of the many expenses attending the training and fitting out of a young man for the Indian service. Till one or both of these sources of expenditure be diminished, of which there is but little prospect, it is idle to talk of materially reducing the cost of European functionaries in India.

The greatest revenue which a colonial empire ever yielded, and, in fact, the largest public revenue in the world, that of Britain and France excepted, is unequal to meet so enormous an expenditure; and one of the worst forms in which bad government can present itself, oppressive and grinding taxation, is the necessary consequence. Nor is it, perhaps, in the power of the best disposed administration much to ameliorate this state of things, so long as government is conducted on the principles hitherto persevered in. The Indian revenue approaches to 20 millions, and considering the poverty of the people, as indicated by the low rate of wages, and the comparatively small amount of capital and industry in the country, this is said to be equivalent to an annual public revenue in England of about 100 millions; and it should be remarked that the Indian revenue never diminishes, but, on the contrary, may be considered a perpetual war taxation, from which there is no

relief or abatement. While India is subjected to this amount of taxation, there is reason to fear that her prosperity will not make any considerable advance, nor the people be attached, or even reconciled, to the dominion of strangers, especially while at the same moment they are carefully excluded (which never happened to them under any previous foreign dominion) from all respectable or responsible share in their own government.

But, without inquiring whether it be possible materially to diminish the amount of taxation imposed on India, it is certainly possible to do what is of equal importance, that is, to change the mode in which it is assessed. We have already given some account of the perpetual settlement adopted under Lord Cornwallis for the assessment of the land revenue in Bengal (see *asm.*, p. 357); and, whatever may have been the defects of that settlement, there can be no doubt that, by limiting the amount of the assessment, it has been productive of the greatest advantage. But in the Madras provinces, and in the greater part of India, exclusive of Bengal, under our dominion, the land-tax is not only oppressively heavy, but a system has been adopted in regard to the management of the land and the assessment of the tax that seems to be wholly subversive of the security of property, and to be calculated only to discourage, or rather extinguish, industry. (For proofs of this, see *India* (Barriss), and *Madras*.) But this is not of the essence of a land-tax: it is an abuse creditable to those by whom the system was originally recommended, and still more discreditable to those by whom it is maintained, after experience has fully demonstrated its pernicious influence. The first thing essential in India is to establish the security of private property; to make the occupiers of the land feel that they have an interest in its improvement; and that the produce obtained by superior industry and intelligence will not be wholly swallowed up by fiscal rapacity. Even if we cared nothing for the interests of the people of India, but took it for granted that Providence had consigned them to our keeping, mercy that we might extract from them the utmost possible amount of revenue, this would be our best course. The real, and, in the case of India, the only way to increase revenue, is to increase the wealth of the people; and this will be best done by giving them a permanent interest in the improvement of the soil, and by making the assessment fixed, if not for ever, at least for a lengthened period.

Notwithstanding the vast demand in this and other European countries for sugar, coffee, cotton, hemp, and other staple products of India, and her illimitable capacities for their production, they have hitherto been exported only to a comparatively trifling extent. This is ascribable principally to the poverty and ignorance of the cultivators in India, arising from the uncertainty of the land tenures and the oppressive amount of the land-tax, and partly to high discriminating duties laid on East India produce in Great Britain and those European states that have colonies in the West Indies. But it is abundantly certain that the adoption of a more liberal system with respect to taxation in India, and of an equal tariff at home, combined with a little judicious encouragement at the outset on the part of the Indian government, might provide for an indefinite increase in the culture of the great articles of Indian produce suited for the European markets. The wonderful extension of the Indigo culture above exclusively what may be expected from a liberal course of policy. But no considerable improvement need be looked for in the greater part of the country while the land-tax continues to be assessed as at present. This forms at once an insuperable obstacle to the investment of British capital in the cultivation of the land, and to the acquisition of wealth by the native cultivator, and is, in fact, destructive alike of the means and the hope of improvement.

One advantage the people of India certainly derive from British rule, which they never enjoyed, at least to the same extent, before—freedom from civil war, and from foreign aggression and invasion. But it must, at the same time, be acknowledged, that these benefits have been purchased at no inconsiderable price—the suppression of all competition and emulation between different parts of the country; and the entire sacrifice of national independence, accompanied with an utter hopelessness of those successful insurrections by which other Asiatic people rid themselves of tyranny, and procure, at least, a momentary melioration of their condition. What probability, it may be asked, is there of the stability and permanence of our dominion? This is a question more easily put than answered. No people under the same circumstances ever possessed such an empire before, or any thing resembling it; and we have, therefore, no precedent to guide us in attempting a reply. We shall, therefore, content ourselves with stating, that India appears to be unassailable, except by a nation that has the command of the sea. Her land frontier is fenced by impassable mountains, and by deserts and rivers that could not be traversed by an invading army without great

difficulty and loss. No doubt, however, if we voluntarily cross the natural barriers that protect India, and advance into Central Asia, we may meet Russian troops on ground congenial to them; and if so, the prestige that has been attached to our arms in the East will run a considerable risk of being dissipated. But so long as we confine ourselves within the proper limits of India, and preserve our superiority at sea, we have little to fear from foreign aggression. An attack by Asiatic powers is out of the question; and the danger of French and Russian invasion is far more chimerical than real. Our superior national resources, commercial enterprise, and naval power, gave us our Indian empire, and maintain our supremacy over it. Any nation that should deprive us of these might possess itself of India without any extraordinary difficulty; for in the hour of need the natives would not certainly render us any effectual support. But, in so far as can be surmised at present, we have nothing to apprehend from the superior power of foreign foes or rivals: and as to danger from internal insurrection, we have the best security against it in the singular docility of the people, their want of nationality or patriotism, their political ignorance, the innumerable divisions which exist amongst them, and their incapacity of combination for any great purpose. Our greatest danger arises from our advancing into Central Asia, from the vast expenditure of our government, the frequency of our wars, and the grievous taxation to which these lead, a taxation which cannot but engender a discontent and dissatisfaction, the results of which no one can at present foretell.

Body and intellectual endowments.—The Hindoos, as already stated, constitute six sevenths of the population of Hindostan; but the remaining inhabitants, though the stocks were in many cases originally different, are now so much assimilated with them through a mixture of blood, and the adoption of Indian manners and customs, that for our present purpose the whole population may be considered under one head. In point of race, the Hindoos have been regarded by naturalists as belonging to what they call the Caucasian, and even to the same family of that race as the white man of Europe! But this is a fantastical notion, for which there is hardly even so much as the shadow of a foundation. The only three points in which any analogy has been discovered between the Hindoo and European are the oval form of the face, the shape of the head, and traces of a certain community of language. In every other respect the points of contrast are incomparably more decisive than those of resemblance. The European is white, the Hindoo black. The European (and his is the only race that is so distinguished) has an infinite variety in the colour of the hair, from faxen to black, and great variety in the colour of the eye, from light blue or grey up to dark brown: with the Hindoo, the colour of the hair is ever black, and the colour of the eye ever dark brown. The European is taller than the Hindoo, more robust, and more persevering. Even in the rudest states of civilisation, the European has exhibited a firmness, perseverance, and enterprise, which strikingly contrast with the feeble, slow, and irresolute character of the Hindoo. In the performance of ordinary labour in those employments where there are means for drawing a just comparison, the labour of one Englishman is equal to that of three ordinary Indians. Three Indian seamen will hardly perform the work of one English seaman, and three battalions of sepoys would not, in any case, supply the place of a single battalion of Europeans. There is little doubt but that an equal inferiority would have been the result of a trial of strength with a Roman legion or a Greek phalanx. When the skill required in any particular employment rises in amount, and the European is enabled to avail himself of improved tools which the Hindoo either cannot or will not use, the disparity becomes still greater: thus, — A master shipwright, or a master carpenter, in India, finds it as cheap to employ a single European at 80 per month as eight Hindoos at the same amount of wages! In physical force and continuity of labour the Hindoo is unquestionably not only below the European, but below the Arab, the Persian, and, above all, the Chinese. When, therefore, we hear of the price of labour being low in India, we must confine it to the roughest and rudest kind, viz. rural labour; and even then it must be taken with much allowance. Looking at the quantity of labour performed, and the manner in which it is executed, the rate of Indian wages is high; and it is only the nominal rate, or that paid for labourers employed by time, that is low.

In one physical quality there is a striking distinction between the Hindoo and European. The European is born with an inflexible and comparatively rigid fibre; the Hindoo with a fibre more pliant and soft than that of our women. This distinction, however, is a mere affair of climate, for the quality supposed in this instance to be peculiar to the Hindoo frame is common to that of natives of every warm climate; even Creole Europeans, in the very first generation, are distinguished by it.

This flexibility in the animal fibre has been supposed, by some observers, to be accompanied with great sensibility and acuteness in the organs of sense, conferring upon the Hindoo a remarkable advantage in some of the nicest of the manual arts. But there is no truth in this hypothesis any more than there would be in imagining, contrary to all experience, that the nicer and more pliant fingers of a woman confer upon her an advantage in skilled labour over a man. In the nicer processes of mechanic art, habit soon gives to the rigid hand of the European artisan a nicety of touch and a dexterity of execution which no Hindoo has ever yet attained: In general, the Hindoos possess more agility than the Europeans, and their nimbleness is assisted by the lightness of their persons. They are, to a remarkable degree, the best runners, the best wrestlers, and the best climbers of Asia. In these respects the Persians, Arabs, and Chinese, are not to be compared with them. Hence it follows that, as ordinary seamen, they are far more dexterous and useful than any of these nations, yet a certain want of firmness and presence of mind incapacitate them for officers, or even for steersmen, and, in this latter capacity, the natives of the Philippine Islands are so preferable to them, that, whenever they can be obtained, they are always employed, to the total exclusion of the Hindoos. A Hindoo cannot be urged to any personal exertion for a great length of time without producing failure or exhaustion. Even in their own country and climate the sepoys have been beaten by European troops, in a long succession of forced marches.

Among the Hindoo nations, though the common features of their physical and intellectual character are generally well preserved, much variety exists;—more, probably, than among the nations of Europe. This variety has been ascribed to difference of latitude and climate, and to diversity of aliment: it has been affirmed, that the inhabs. of the south, whose chief aliment is rice, are smaller and feebler than those of the north, whose chief bread corn is wheat and millet. Experience shows that this opinion is without any foundation. The smallest and the feeblest family of Hindoos are the natives of Bengal, whose locality is between the 21st and 26th deg. N. lat.: those living a dozen degrees farther south, and upon the same vegetable aliment, are taller, more robust, energetic, and hardy. The natives of the table-land, whose vegetable aliment is neither rice nor wheat, are equal but not superior to the inhabitants of the Carnatic, or of the low damp coast of Malabar. The tallest and most robust, but not the most active or agile, are the inhabs. of the upper portion of the valley of the Ganges, where a few of those in easy circumstances live only on wheat; the majority of the people on barley or millet.

It is the quantity and not the quality of the vegetable aliment which has the most material influence in India; it may be said, that in Hindostan generally there is a wider distinction in physical development between the classes in easy circumstances and the poor, than in any other country. The Hindoos of the upper and more distinguished classes, are almost invariably larger, stouter, and handsomer than the poor and degraded classes. The most inattentive observer cannot fail to notice the superiority of the military, mercantile, and above all the sacerdotal classes over the common labouring pop. The sepoys of the army of Bengal, who are a selection from the numerous yeomanry of the northern and central provinces, though very inferior in strength and energy, are equal, if not superior, in stature and personal appearance to the common run of European troops; and even in the streets of Calcutta, a stranger cannot fail to be struck with the disparity in the appearance of the well-fed merchant, or broker, and the equally half-starved labourer or artisan. The mountaineers, and generally all the semi-barbarous tribes, are short, emaciated, and ill-looking, particularly those who gain their livelihood by the chase, or by collecting the natural products of the forests, such as honey wax, and drugs. Where slaves are few in number, and this is the case in all the populous parts of the country, they are in personal appearance nearly on a level with the rest of the peasantry, and not to be distinguished from them. Where, however, they are numerous, and whole tribes are in a servile state, they may be easily distinguished from the rest of the community by their ugliness, small stature, and feeble frame. As a general rule it may be laid down, whatever be the climate, and whatever the general aliment, that wherever the price of labour is low, and the people consequently compelled by necessity to live upon the lowest description of food, or upon the smallest possible quantity of a better description that will support life, the great mass of the inhabs. are the most degraded in body, as well as in mind.

It is a popular but erroneous notion that the Hindoos live almost entirely on a vegetable diet: such a fact would be inconsistent with the physical nature of man, who, in reality, is omnivorous. The most fasti-

dious of the Hindoos in point of diet are great eaters of milk and butter; fish is also extensively used near all the sea-coasts, and on the shores of the principal rivers; and none of the people of India hold this description of food as abominable, except the inhabs. of the remote interior, who have no means of procuring it. Even flesh, however capricious in the selection, is occasionally eaten by the greater portion of the Hindoo people; and it is the want of means, rather than religious scruples, that makes them refrain from it. In cases of urgent necessity, even religion authorises any kind of food, and in the event of famine, a brahmin may eat the limb of a dog.

Upon the intellectual and moral qualities of the Hindoos, a very few words will suffice: the more educated classes, and it is from a consideration of the character of these only that any fair conclusion can be drawn, may be pronounced without hesitation to be a shrewd, wary, and acute people. Subtlety, perhaps, more than strength, is the prominent character of their intellect. Good imitators, they have hitherto discovered no original powers of invention. They have little imagination, for the poor distempered dreams of their theology and literature are not entitled to this name. In practical good sense they are decidedly below the Chinese. If vigour and manliness of mind, they are below the Arabs, the Persians, and those Mohammedan nations of Tartary who sent forth the men that invaded and conquered them. We make no comparison with European nations, because the contrast is too great to admit of any parallel. The departments of industry, in which their intellectual faculties appear to most advantage, and for which they seem best fitted, are the administration of justice and finances, and such branches of trade as do not imply the possession of comprehensive knowledge and bold enterprise. Orme's account of their character in this respect is strictly just. "They are," he says, "the acutest buyers and sellers in the world, and preserve through all their bargains a degree of coolness which baffles all the arts that can be opposed to it."

The moral character of the Hindoos is the growth of probably many thousand years of anarchy and oppression. Such a condition of society produces no demand for candour, integrity, or ingenuousness; and among the Hindoos these qualities can hardly be said to exist. Rapacity, violence, fraud, and injustice characterised the native rulers; and the usual weapons of defence, viz. falsehood, artifice, chicanery, and deceit, have, consequently, sprung up in abundance among the people. In reality, for generations, integrity may be said to have been at a discount in India, and dissimulation at a high premium. Probity and candour are virtues which, in fact, could not be practised with any regard to personal freedom, life, or property; in such a state of things, such a simoleon as an honest man would have become the inevitable prey of a host of knaves, and would have been laughed at and despised. Generally it may be said that the Hindoos seldom speak the whole truth without some mental reservation. Judicial perjury is practised in Hindostan perhaps on a wider scale than in any other country in the world. Our courts of justice have been blamed for encouraging the crime, and probably, to a certain extent, they do so; but, upon the whole, they can only be looked upon simply as an arena for the exhibition of this vice upon a great scale. Falsehood and equivocation are inseparable from such a condition of society as that of Hindostan, and have characterised the manners of the Hindoos from the era when Europeans first acquired any authentic information respecting them. The description which Bernier, one of the most accurate of travellers, has given of the Hindoos under Aurungzeb, is strictly applicable to the present times. Sir William Jones, often their indiscriminate eulogist, declared from the bench his conviction, that affidavits of every imaginable fact might as easily be procured in the streets and markets of Calcutta as any other article of traffic; adding, on the subject of oaths, that even if a form the most binding on the consciences of men were established, there could be found few Hindoo consciences to be bound by it.

With singular exceptions in favour of the military classes, timidity, and even pusillanimity, characterise a very large portion of the Hindoo pop. This opposes the most serious obstacle to their good government. The great body of the people have neither the spirit nor courage to defend themselves or their property, or to resist oppression in a straightforward manner, and consequently they become easy victims to every possessor of power, by whatever means obtained. The Arab, the Persian, the Chinese, and the Malay knows how to defend himself from insult and robbery, by some means or other, however rude; but the Hindoo puts up with oppression without directly resenting it, and, like the weaker animals that are the natural prey of the stronger and more ferocious, trusts to artifice and cunning for his defence.

This view of the Hindoo character is not inconsistent with a wrangling and litigious disposition among themselves. They brawl and scold with infinite animation, but rarely come to blows. A very frequent mode of settling, or at least prosecuting family feuds, is an action or suit at law.

Among the better qualities of the Hindoos may be reckoned frugality, patience, docility, and even industry. But the first of these virtues makes, in many cases, too near an approach to avarice. This is a quality of the Hindoo character which it is not very easy to explain. The usual effect of bad government, by rendering property insecure, is to make the people prodigal, and if not indifferent to possession, at all events careless of accumulating. Undoubtedly opposite effects have been the result among the Hindoos. Mr. Orme, endeavouring to account for it, says, "Slavery has sharpened the natural fineness of all the spirits of Asia. From the difficulty of obtaining, and the greater difficulty of preserving, the Gentooes are indefatigable in business, and masters of the most exquisite dissimulation in all affairs of interest." This states the fact very correctly, but leaves the cause wholly unaccounted for; for undoubtedly slavery has produced no such effect on the Arabs, the Turks, the Persians, the Chinese, or even the Mohammedans of India. The docility, too, of the Hindoos is very much akin to passiveness; they are almost as easily trained to submit to oppression and rapacity, as to endeavour to improve and amend their condition. (For further details, see India (Burrish), and the arts. BENGAL, BOMBAY, MADRAS, &c.)

HIRSCHBERG, a town of Prussian Silesia, and a considerable emporium for the linen manufactures of that prov., cap. circ., on the Bober, near the Riesengebirge. 25 m. S.W. Liegnitz. Pop. (1838) 7,000. It is fortified and well built; has 4 suburbs, 5 churches, one of which is Protestant; a gymnasium, deaf and dumb and orphan asylums; and is the seat of the council, and superior courts for the circle. Fine lawn is woven in the neighbourhood, in which there are also many sugar refineries, bleaching establishments, and paper-mills. Its manufactures are, however, said to have fallen off very much since the middle of last century. Warmbrunn, the most celebrated watering-place of Silesia, is at no great distance from this town. (*Uerghaus; Murray's Handb.*)

HIRSCHFELD, or **HERSFELD**, a town of Hesse-Cassel, prov. Fulda, cap. distr. and principally of the same name, on the Fulda, which is here crossed by a stone bridge, 32 m. S.E. Cassel. Pop. 6,450. It is walled, and has 2 churches, an hospital, an orphan asylum, numerous other charities, and the best-conducted Calvinist college in the electorate. It has also some woollen cloth factories, tanneries, &c.

HITCHIN, a market town and par. of England, co. Hertford, hund. Hitchin and Pirton, 31 m. N. by W. London, and 13½ m. N.W. Hertford. Area of par., 6,150 acres; pop. of do., in 1831, 5,211. The town stands at the foot of a steep hill belonging to the Chiltern range, and consists of several streets, irregularly laid out, and lined with old but well-built houses. The church, in the ornamental Gothic style, has a low embattled tower, surmounted by a spire and a S. porch, a fine specimen of Tudor architecture: the interior, which is richly ornamented, contains a curious font, and many splendid monuments. There are 3 places of worship for dissenters, 2 endowed schools, with 70, 2 Lancasterian schools, with 300, children, an infant school, and some almshouses. The trade of Hitchin, which in the 14th, 15th, and 16th centuries, was a large wool-staple, is now chiefly confined to mealing and malling, its markets being well attended and abundantly supplied with grain. Straw-plaiting employs many hands; and there is a silk-mill. The town is divided into 3 wards, each governed by 2 constables and 2 headboroughs, appointed by the lord of the manor. Petty sessions are held by the county magistrates on Tuesdays and market days. Fairs, Easter and Whit Tuesday, for sheep and pedlary.

HOANG-HO, or **YELLOW RIVER**. See **CHINA**.
HOCHSTADT, a small town of Bavaria, circ. of the Upper Danube, on the N. side of the Danube, 23 m. N.W. Augsburg, and 2 m. W. Blenheim. The great victory gained here on the 13th Aug. 1704, by the English and Imperialists under the Duke of Marlborough and

Prince Eugene, over the French and Bavarians, is called by the French and Germans the battle of Hochstätt: we call it the battle of Blenheim. See **BLINHEIM**.

HOFF, a town of Bavaria, circ. Upper Franconia, cap. of a distr. on the Saale 27 m. N.E. Bamberg. Pop. 6,800. It is walled, and has 2 suburbs, a gymnasium, with an extensive library, and several charitable institutions. Its manufactures consist of muslins and other cotton fabrics, on an extensive scale; and of cotton yarn, woollen stuffs, leather, paper, colours, &c. It has 2 annual fairs. Iron mines and marble quarries are wrought in its vicinity.

HOGUE, or **HAGUE** (**CAP DE LA**), a bold prominent headland of France, on the English Channel, at the N.W. extremity of the d'p. is Manche, 16 m. W. by N. Cherbourg, lat. 49° 43' 33" N., long. 1° 45' 18" W. This cape is famous in naval history, from the great battle fought in the adjacent seas on the 19th, 20th, and 22d of May, 1692, between the combined English and Dutch fleets under Admiral Russell, and the French under Tourville. The allies, who were superior in force, gained a decisive victory; about 20 of the French ships, including that of the admiral, were taken or destroyed. This engagement may be considered as the era of the naval preponderance of England over France.

HOHENLINDEN, a village of Bavaria, circ. Isar, 19 m. E. Munich. Near this village took place, on the 3d of December, 1800, one of the greatest conflicts of the revolutionary war, between a French and Bavarian army, under Moreau, and the Austrians, under the archduke John. The former gained a complete victory. Besides killed and wounded, the Austrians lost 10,000 prisoners and 100 pieces of cannon. Campbell's noble ode, entitled *Hohenlinden*, has rendered the name at least of this battle familiar to most Englishmen.

HOLBEACH, a market town and par. of England, co. Lincoln, wap. Elope, parts of Holland, 37 m. S.S.E. Lincoln, and 89 m. N. London. Area of par., 20,240 aces; pop., in 1831, 3,990. The town, situated on the Bedford Level, between the Glen and the Nen, and about 6 m. from the sea, is old and badly built. The church is large and handsome, having a tower surmounted by a light octagonal spire, which is visible from a great distance across the fens. A chapel for Wesleyan Methodists, a well-endowed free school, and an hospital for 14 poor old men, are the only other public buildings. Holbeach is one of the polling places for the S. division of the co. Markets on Thursday: horse-fairs, well attended, May 17., Sept. 11., and Oct. 11.

HOLLAND, or **THE NETHERLANDS**, comprising the territories formerly included within the **SEVEN UNITED PROVINCES**, now a secondary European kingdom, but which, in the 17th and 18th centuries, was an independent republic, raised by the industry, economy, and enterprise of its inhabitants to the first rank as a commercial and maritime power. The kingdom of Holland (exclusive of Dutch Limburg and Luxemburg) lies in N.W. Europe, between lat. 51° 12' and 53° 30' N., and long. 3° 22' and 7° 12' E.; having E. Hanover and Rhenish Prussia, S. Belgium, and W. and N. the North Sea. Length, N.E. to S.W., about 200 m.; average breadth about 65 m. The W. half of Limburg, which belongs to Holland, joins the above territory on the S.E., and is enclosed by Belgium W. and S., and Rhenish Prussia E. That part of the grand duchy of Luxemburg which belongs to Holland is situated between lat. 49° 28' and 50° 13' N., and long. 5° 45' and 6° 30' E.: it is detached from the rest of the Dutch dominions, and surrounded by those of Prussia, Belgium, and France. The area, pop., subdivisions, chief towns, &c., of these territories are as follows:—

Provinces.	Area in sq. m.	Pop. (Jan. 1838.)	Pop. to sq. m.	Chief Towns, and Population.
HOLLAND:—				
North Brabant	1,576	365,160	185	Rotterdam, 13,500. Breda, 15,000.
Guelderland	1,968	436,401	221	Amberg, 11,700.
North Holland	558	423,873	412	AMSTERDAM, 207,000. Leyden, 56,000.
South Holland	1,173	509,661	434	Rotterdam, 74,000. The Hague, 56,000.
Zeeland	671	145,548	817	Middelburg, 14,000. Sluys.
Utrecht	825	140,974	268	Utrecht, 36,000.
Friesland	1,264	227,415	179	Leeuwarden, 17,000.
Over-Yssel	1,240	191,062	148	Zwoll, 14,000. Deventer.
Groningen	1,000	175,437	173	Groningen, 30,000.
Drenthe	1,028	70,471	68	Assen, 1,800.
		January, 1837.		
Dutch Limburg	763	178,000	233	Maastricht, 22,000.
Dutch Luxemburg	975	154,000	158	Luxemburg, 11,000.
Total	15,598	3,910,396	214	

Physical Geography.—With the exception of some insignificant hill-ranges in Guelderland and Utrecht, and a few scattered heights in Over-Yssel, the whole k. of Holland is a continuous flat, partly formed by the deposits brought down by the rivers intersecting it, and partly conquered by human labour from the sea, which is above the level of a considerable portion of the country. Holland is consequently at all times liable to dangerous inundations. The W. coast, however, from the Helder to the Hook of Holland, is partially protected by a natural barrier composed of a continuous range of sand-banks, or *dunes*, thrown up by the sea, of great breadth, and frequently 40 or 80 ft. in height. As the sand, which is very fine, is easily blown about by the winds, the dunes are carefully planted with the *Arundo donaria*, or bent, which binds them firmly together, obviating the injury that would otherwise be caused by their spreading over the country, and rendering them an effectual barrier against the encroachments of the sea. But, in other parts of the country, particularly in the provs. of Zealand, Friesland, and Guelderland, the sea is shut out by enormous artificial mounds or dykes, any failure in which would expose extensive districts to the risk of being submerged. In nothing, indeed, is the industry and perseverance of this extraordinary people so conspicuous as in the construction and maintenance of these dykes. It being necessary to shut out not only the sea, but the rivers, the channels of which are in parts elevated considerably above the level of the land, the extent of dykes is immense, and the expense and labour required to keep them in repair is very great. They are constructed principally of earth and clay, sloping very gradually from the sea or the river, and usually protected in the more exposed parts by a facing of wicker-work formed of interlaced willows: sometimes their bases are faced with masonry; and they are in parts defended by a breastwork of piles, intended to break the force of the waves. The most stupendous of these dykes are those of W. Capelle, in the island of Walcheren, and that of the Helder; but there are many others of hardly inferior dimensions.

The rivers of Holland have mostly a W. or N. direction. The principal is the Rhine, which, for the most part, separates N. Brabant from Guelderland and S. Holland, and after receiving the Meuse, divides into two principal arms, called the Maese and Hollands-Diep. Before reaching Nimeguen, it has given off a branch to the N., which, though of less size, preserves the name of the Rhine instead of the main stream, and itself gives off the Yssel: these two branches discharge themselves into the Zuyder Zee. The main stream from the above point, near Nimeguen, takes the name of the Waal, and after its junction with the Meuse is called the Merwe. A branch called the Lech unites the lesser Rhine with the Merwe E. of Rotterdam. (See *HANTS*.) The Meuse traverses the S. E. part of Holland: the Scheldt, its S. W. extremity. The Maese, true Rhine, and Scheldt discharge themselves into the North Sea. The estuary of the Ems forms the N. W. boundary of Holland. Lakes are extremely numerous, especially in the N. provs.; and there are some extensive marshes, as the *Bouring* on the N. E. frontier, the *Peel* in N. Brabant and Limburg, &c. The islands may be classed in two groups: the S. group, composing a great part of the prov. Zealand and a portion of S. Holland, is formed at the mouths of the principal rivers, and comprises Cadzand, N. and S. Beveland, Walcheren, Schouwen, Tholen, Over-Flakkee, Vlieland, Beyerland, Yssermond, &c.; the N. group follows the line of coast stretching from the Helder to near the mouth of the Ems, and includes the Texel, Vlieland, Ter Schelling, Ameland, &c. There are several small islands in the Zuyder Zee. (*Rabbi, Abrégé*, pp. 357, 363.; *Dict. Géog.*; *De Cloet, Descr. Géog.*, &c. *des Pays Bas*.)

Climate.—Holland is colder than any part of England in the same lat., and all passage for ships on the great canal between Amsterdam and the Helder is annually stopped by ice for three months. The mean temperature of the year throughout the country is stated in the *Journal de Travaux* of the French Statistical Society to be 47° Fahr. According to official tables published in 1829, the range of temperature from 1815 to 1824 inclusive was from 23° below zero to + 109° Fahr. The climate generally is variable, and the atmosphere much loaded with moisture, especially in the W. provs., where intermittent fevers, dropsies, pleuritis, rheumatism, and scurvy are frequent diseases. Guelderland is the healthiest prov., but all the E. parts of the country are warmer and more salubrious than the others. Holland is continually subject to strong winds, without which, indeed, to remove the exhalations from the stagnant marshes, canals, &c., the country would be very unhealthy. This circumstance is also taken advantage of for turning innumerable windmills, by the help which the drainage of the land is thereby effected. (*See post*.) In winter the winds sometimes rise to violent tempests, and in spring are often very high. They are particularly liable to cause

inundations, by raising the tides on the coast higher than usual, when they blow strongly from the W. or N. W. In winter N. or S. E. winds are the most common; snow falls abundantly, and even the Zuyder Zee is sometimes frozen over. In summer cold nights often succeed to days of intense heat. (*De Cloet*, p. 25.; *Lettres sur la Hollande*, l. 8^e, &c.)

Natural Products.—The soil being almost every where alluvial clay and sand, Holland possesses little, if any, mineral wealth. It has no mines of any description. Some bog-iron is met with, but no other metal. No coal deposits are found, but, extensive beds of marine peat, of a most excellent quality, abound, especially in Friesland and Holland. Potters' clay, fullers' earth, and some calcareous products, are met with, but scarcely any stone is found from one end of the kingdom to the other. Holland, however, is abundantly supplied with granite and limestone, conveyed from Limburg by the Meuse; but the greater part of the lime used in the marit. provs. is obtained by burning sea shells. The country contains very little wood. There is some timber in the E. provs., and at the Hague, Utrecht, and Haarlem, there are woods of oak, elm, beech, &c., but, speaking generally, most of the trees have been planted. The principal canals, especially in and near the towns, are lined with rows of willows and poplars; and in various places along the sandy shore firs are produced. In other respects the vegetation is very similar to that of England. The fringing willow (*Mentha sylvestris*), however, which is rare in the latter country, here floats in the greatest profusion on the surface of the canals, and the more rare *Senecio paludosus* is not unfrequently met with. The zoology, also, is in most respects like that of our own country. The larger kinds of wild animals are not met with. Hares and rabbits are pretty plentiful, but not winged game. The preservation of game is an object of great interest to most proprietors; and notices to that effect are fixed up, and great vigilance exercised to prevent the trespassing of sportsmen and others. In dry seasons, in some districts, field mice multiply to such an immoderate degree as to prove serious loss to the farmers, by destroying the roots of the grass in the meadows, where they burrow by millions. The pools and marshy grounds abound with frogs and other reptiles, which are a favourite food of storks. These birds are particularly numerous in Holland, where they remain from the middle of February to the middle of August. They are great favourites, and severe penalties are enforced upon their wilful destroyers. In the towns they build their nests on the houses; and in those parts of the country that are destitute of trees, buildings, or other points d'appui, an old cart-wheel is very often raised upon a high pole, to afford them facilities for the same purpose. Water-fowl are very abundant. The principal fish that frequent the Dutch coasts are cod, turbot, soles, and other flat fish. The herring fishery, an important source of wealth, will be afterwards noticed. (*Dict. Géog.*; *Chambers's Holland*, pp. 23—36. &c.; *Barrow's Tour in S. Holland*, p. 69.; *De Cloet*, pp. 36—39.; *Jacob*, pp. 8, 17.)

Public Works, Dykes, Canals, &c.—There is perhaps no country for which nature has done so little, and man so much, as this. The first and greatest of the works of art are the stupendous dykes before alluded to. The construction and repair of these prodigious bulwarks is placed under the control of a particular department of the government (*Waterstaat*), and of a corps of engineers especially appointed for this important service. The expenditure of this department amounts to a large sum annually. The cost of each dyke is defrayed by a tax laid on the surrounding lands, assessed according to long-established usage, and levied by commissioners appointed for the purpose. The expenditure in labour, though great, is generally much exceeded by that in willows and timber. The former are raised in extensive plantations near the places where they are wanted.

If there be any danger of an inundation, the inhab., on a signal being given, repair *en masse* to the spot. There is never any backwardness on these occasions, every one being fully aware not only that the public interest is at stake, but that his own existence perhaps, and that of his family and friends, would be involved in extreme hazard should the waters break through the dykes. Hence, the most strenuous efforts are made to ward off the impending danger, and every possible device is adopted by which the dykes may be strengthened, and the threatened inroad prevented, or its violence mitigated. In despite, however, of these precautions and efforts, Holland has on numerous occasions sustained extreme injury from inundations. That extensive arm of the sea called the Zuyder Zee, between the provs. of Holland, Guelderland, and Friesland, occupying an area of about 1,900 sq. m., was formed by successive inundations in the course of the 13th century. The Haarlem Meer or Lake owes its origin to an inundation in the 16th century, which proved fatal to great numbers of the

inhab.; and very many inundations have taken place within a comparatively recent period. Owing, however, to the improved construction of the dykes, and the greater skill in engineering, these calamities are now neither so frequent nor so destructive as formerly. But they still occasionally occur.

Some of the interior parts of the country traversed by the great rivers are probably even more exposed to the dangers of inundation than those contiguous to the shore; and when the *débrûle*, or breaking up of the ice, takes place in the upper part of the river, before it has begun nearer the sea, as is sometimes the case, the risk of inundation is extreme. On such occasions every effort is made, not excepting even the employment of artillery, to break the ice and facilitate the exit of the water, but sometimes without the desired effect. The following is an instance of this sort of calamity. "One of the richest tracts of country, in the vicinity of Arnhem, has been often exposed to tremendous inundations. These are frequently felt at the breaking up of a long frost; but in no instance so calamitously as in the winter 1808-9. A violent tempest from the N.W. had raised the waters of the Zuyder Zee some feet above the highest mark of the spring tides, and the waves beat with unusual violence against the dykes constructed to break their fury. The thaw on the Upper Rhine had increased the quantity, and the force of its waters, which brought down masses of ice 14 ft. in height, and more than half a mile in length; to which the embankments, softened by the thaw, and somewhat injured, presented an insufficient barrier. A breach made in one part soon extended itself, and the torrent quickly covered the country, bearing before it by its force the villages, the inhab., and the cattle. The height of the Zuyder Zee prevented the water from finding an outlet; and it consequently remained on the ground for a long period, in spite of the exertions of the surviving inhab. By this event, more than 70 houses were totally destroyed, a far greater number irretrievably damaged; and of 900 families, more than 400 were rendered utterly destitute: more than 400 dead bodies were left on the borders of the current; and at the city of Arnhem 500 persons, mostly women and children, with many hundred head of cattle, were rescued from a watery grave, by the hazardous heroism of the inhab., who ventured in boats to their rescue." (*Jacob's View of the Agric. of Holland*, &c., pp. 57, 58.)

The general aspect of Holland is different from that of any other country in Europe. Its surface presents one immense network of canals, which are there as numerous as roads in England, the purposes of which, indeed, they too for the most part answer. The greater number are appropriated to the drainage of the land; many, however, are navigable by large vessels. The principal is the Grand Ship Canal of N. Holland, between Amsterdam and Nieuwediep, near the Helder. This noble work, the greatest of its kind in Europe, is about 604 m. long, 125 ft. broad at its surface, and 36 at bottom, with a depth of 20 ft. 9 in.; it extends from Amsterdam to the Helder, and was completed between 1819 and 1825, at an expense of 950,000*l*. It has a towing path on each side, and admits of two frigates or merchant vessels of the largest size passing each other. The lock-gates at its entrance exceed in dimensions the largest in the docks of Liverpool. By means of this canal, ships avoid the delay and danger they were formerly subject to in navigating the Zuyder Zee, and reach the Texel from Amsterdam in 18 hours. As a commercial speculation, it has been but indifferently successful; but it is of incalculable benefit to Amsterdam, to which it has given all the advantages of a deep-water harbour on the most accessible part of the Dutch coast. The other chief canals are—the *Zederik*, in S. Holland, from Vianen to Gorcum; that from Bois-le-Duc to Maastricht, available for vessels of 800 tons; and that between the Fms and Harlingen, in Friesland. As they run through an entirely level country, locks are generally unnecessary, except at their mouths. One of the finest monuments of scientific skill to be seen in Holland, is a succession of locks or sluices of enormous size and strength, constructed in 1809, at the mouth of that branch of the Rhine on which Leyden is situated. This mouth was for a long period choked up with sand, but it is now kept quite clear, the locks being closed with the flow and thrown open by the ebb of the tide. The larger canals are commonly about 60 ft. broad, by six deep; and though often below the level of the sea, not only their surface, but their bottom, is frequently higher than the adjoining country. The smaller canals, by which the country is drained, traverse and surround sections of land protected from inundations by means of dykes.

Such sections are termed *polders*. A tract of land on being rescued from the sea or a river is in the state of a morass or marsh; and the next process is to dry it, so as to render it suitable for tillage or pasture. To effect this, the marsh is intersected by water-courses, and windmills are employed, as in the Fens in England, to lift up the water. These mills are erected on the dyke

or rampart, excluding the sea or river, and raise the water to a ditch or canal on the other side. Pumps are seldom employed for this purpose, wheels being by far the most generally used. Sometimes the marsh is too extensive to be drained simultaneously, in which case it is divided into compartments by subordinate ramparts and water-courses; and mills being erected on them, each portion is separately divested of water. In many cases, however, the depth of the marsh below the level of the sea or river is too great to allow of the drainage being effected by one series of ramparts and ditches; and in these cases, two or more series of ramparts, ditches, and mills are constructed at different elevations, the water being lifted up successively from one to another, till it is finally brought to the desired level and conveyed away. We may form some idea of the labour and patience required in an undertaking of this kind, when we learn that the surface of some of these polders is as much as 24 ft. below high water mark, and 30 ft. below the level of the highest tides! The soil of the polders is of very various sorts. Where it is clayey, and the drainage perfect, they are extremely fertile, and are not unfrequently cultivated; but where the soil is mossy, or the drainage incomplete, they are employed as meadows.

In sailing along the arms of the sea, the rivers or canals of this singular country at a considerable elevation above the surrounding fields, one is forcibly reminded of Goldsmith's verses:—

"To men of other minds, fancy flies,
Embosom'd in the deep where Helios lies:
Methinks her patient sons before me stand;
Where the broad ocean leans against the land,
And, sedulous to stop the coming tide,
Lift the tall rampart's artificial pride.
Onward, methinks, and diligently slow,
The firm compacted bulwark seems to grow;
Spreads its long arms around the watery roar,
Scorpe out an empire, and usurps the shore.
While the pent ocean rages o'er the pile
Rises an amphibious world beneath his smile!
The slow canal, thy yellow stream, thy vale,
The willow-tufted bank, the gliding sail,
The crowded mart, the cultivated plain,
A new creation rescued from his reign."

The facility with which the country may be laid under water, contributes materially to its strength in a military point of view. This, indeed, is not a resource to be resorted to, except on extreme occasions; but it was repeatedly made use of in the war of liberation, and also in 1672, when Louis XIV. invaded Holland. It is said that in 1820-32 every thing was prepared for an inundation, had the threatened inroad of the French taken place.

The roads and private estates are commonly fenced by canals or ditches alone; hedges are rare. The highways in the central provs. are among the best in Europe. They run for miles in a straight line along the summits of the dykes, and are thus at once dry and elevated, so as to command extensive views. Between the large cities they are broad, and usually paved with a kind of small hard bricks called *clinkers*, mostly made of sand mixed with the clay mud obtained in cleaning the canals. They are fitted so exactly to each other, when laid down, that scarcely a crevice is to be seen, and being well covered with sea sand, they sustain little injury from carriages. Elsewhere, the roads are made of sea-shells and the common soil, well compounded together; which mixture, though soft, is not much cut by the wheels; where water conveyance is so abundant, it may be easily supposed that few carriages will travel on roads burdened with tolls so high as to amount to nearly as much expense as the post-horses. In fact, all the transport of farm-produce and other bulky goods is carried on by means of water; and persons travelling, unless they belong to the opulent classes, commonly make use of the canal barges, or *treckschuts*, towed by horses. The same case in the N. and central provs. is not the case, the roads are so bad as to be scarcely passable in wet weather. A railroad, intended to connect Amsterdam with the other chief commercial cities, is said to be now in progress. (*Jacob's View of the Agric.*, &c., pp. 15-17; *Chambers*, pp. 8, 10-24; *De Cloet, Descr. des Pays Bas*.)

Distribution of Land. Farms.—Of about 7,600,000 acres, which the total surface of Holland (ex. IJmburg and Luxemburg) comprises, there were estimated to be, in 1833, 5,310,000 acres of cultivated land; 2,000,000 ditto uncultivated; 220,000 ditto occupied by canals, ponds, &c.; and the residue by roads, buildings, and public walks. The richest lands are in the S. and central provs.; the poorest, for the most part, in the N.E.; in Over-Yssel and Drenthe, especially, heath and waste lands prevail to a great extent. A good deal of waste land, originally of a very unpromising quality, has, of late years, been brought into cultivation by the pauper population settled upon it. According to Mr. Jacob, the highest price that meadow land bears in any part of the central provs. is about 54*l*. sterling the acre; such land, when let, produces a yearly rent of about 2*l*. 10*s*. an acre, the landlord

paying a land-tax of 25 per cent. The minimum value of pasture land in the same districts is estimated at from 45*l.* to 50*l.* the morgen (about $\frac{1}{2}$ acre); it lets from about 1*l.* 12*s.* to 2*l.* the morgen, and is subject to a like deduction for land-tax. Money vested in land in Holland, can scarcely be made to pay more than 2*l.* to 3 per cent. interest. The farms in the island of Cadzand, and the adjacent parts of Zeeland, &c., vary from 100 to 200 arpents (166 to 300 acres) each. In one of the medium size of 150 arpents, about 30 arpents are generally in fallow, 30 are sown with barley or rapeseed, 40 with wheat, 30 with beans, and 10 with clover, carrots, or potatoes; 30 are in meadow, and trenches, &c. occupy the remaining 10. The Cadzand farms surpass those of Flanders in fertility, the soil being so rich that manure is seldom used. They are commonly let on leases of 7 years: the land-tax varies, according to the quality of the soil, from 10 to 14 florins the arpent. It is estimated, that on a medium-sized farm the farmer must expend about 750*l.* before he begins to derive a return by the sale of his crops. (*Radtke's Agriculture of Flanders, &c.*, pp. 182-206.)

In S. Holland the proportion of pasture to arable land is about 2 to 1. The average size of farms is from 40 to 50 bunders (the same as the French *hectare*, nearly $\frac{1}{2}$ acre each); large farms run from 70 to 100 bunders. The principal proprietors usually let their land on lease to the peasantry; the proprietor paying the property-tax, and the dues on dykes, polders, and water-mills; and the farmer a personal tax and the tax on servants. In some instances the landlords furnish or pay for seed and manure, and go halves in the crops with the tenants on the *me-tayer* principle; but even when this is not the case, the rent is always paid in kind. The leases are commonly for 5 years. In N. Holland, farms average no more than 20 bunders, or 50 acres, each; on which from 16 to 18 cows, 4 calves, a horse, and 15 or 20 sheep, besides a few hogs, may be kept if the soil be good. The rent of pasture-land varies from about 18 to 50 florins, of arable land from 35 to 50 florins the bunder: garden grounds near the towns let somewhat higher. In Friesland, the quantity of pasture is more than 8 times greater than that of arable land. The common size of a farm is from 75 to 100 acres; but some are nearly twice as large. They are generally let on leases of 5 or 7 years, the proprietor paying the land-tax, and the cultivator the other assessments; though in some parts the proprietor contributes his quota to the maintenance of dykes and dams. Few proprietors cultivate their own land. The best day pasture in that province fetches a rent of from 3*l.* to 4*l.* the bunder; but a considerable proportion of the soil is sandy and inferior, and lets for only from 30*s.* to 50*s.* the bunder: there are also about 300 bunders marshy and unproductive, some yielding a rent of no more than 10*l.* a bunder. (*Parl. Reports on Agriculture, 1837.*) In Guelderland there is some good land, but a great deal more is very indifferent; and in the S.W. vast tracks have been planted with Scotch firs and Weymouth pines; many hundred acres have also been sown with acorns, without any hope of the oaks ever reaching the size of timber, but merely for the sake of the underwood of this kind of land has been sold for about 15*l.* the acre; but after having been improved by the proprietor, does not pay more than 2*l.* per cent. interest for the capital invested. In some parts of the prov., however, as for instance Drenburg, there are rich meadows worth from 55*l.* to 70*l.* the acre, and adequate to fatten an ox to the weight of from 2,500 to 3,000 lbs. (*Jacob's View of the Agric., &c. of Holland*, pp. 48-52, 61.)

Crops, Mode of Agriculture.—The principal grains cultivated are rye and barley, next to these come oats and barley: about 1,000,000 last of wheat are produced yearly, 10 per cent. of which is estimated to be consumed in breweries, distilleries, and starch and other manufactories. (*De Cloet*, p. 44.) Wheat is a good deal grown round Utrecht, the country there being more elevated and suitable for it, than most other parts of Holland; the wheat of Friesland, however, is extremely good, as is the prov. of Zeeland yields more than is required for its own consumption. In both the last-named provs. pulse and garden vegetables are abundantly grown, besides wood and madder (about 30,000 quintals yearly. *De Cloet*) in the former, and millet and horse-radish in the latter. Flax is used in large quantities in the S., and especially round Dort, which is the centre of a considerable trade in that article. There is an abundance of fruit in Guelderland and Holland; but in the N. provs only apples and pears come to any perfection. The vine is cultivated only in Luxemburg. Utrecht and Guelderland are noted for their tobacco; 30,000 quintals yearly were formerly sent into the market, from those provs. (*De Cloet*, p. 43.) Potatoes, rapeseed, hemp, clover, mustard, hops, beet-root, and some medicinal plants, are the other principal articles of produce. The ancient passion of the Dutch for tulips and other bulbous plants still exists, though it is now confined within comparatively reasonable limits;

there are some large flower-gardens, in the neighbourhood of Haarlem especially, from which great numbers of bulbs are annually exported.

In S. Holland wheat is the grain most cultivated, the quantity of it raised being double that of barley, which comes next to it in importance. Wheat is said to produce from 12 to 15 fold, and other grains in proportion; but such statements are seldom worthy of much confidence. The rotation in this prov. is usually as follows:—Rapeseed, winter barley, or rye, succeeded by rapeseed, barley, or wheat; flax, beans, or oats, succeeded by summer grains, and these by potatoes; rye, oats, beans, and clover; and the last year the remainder of the clover—after which the ground is fallowed. In N. Holland, rape and mustard seeds, barley, oats, peas, and horse and pigeon beans, are generally grown in the rotation, though no fixed rule is observed. There are no fallows in this prov. In Friesland the better sorts of land are appropriated to wheat, barley, rye, and rapeseed, and the inferior to summer grains, as buckwheat and oats. Rapeseed, after fallows, is succeeded next year by wheat or barley; on wheat lands the alternate crops are barley or beans, flax or potatoes; on rye lands, buckwheat and oats. (*Parl. Reports.*) Near the W. border of Guelderland, the lands when cleared is mowed and sown with buckwheat; after that, a second dressing of dung is administered, and after a single ploughing rye is sown. The rye is usually harvested in July, when turnips are sown after a single ploughing. There are thus regularly 3 crops in every 2 years. The average produce of buckwheat is from 20 to 22 bushels per acre, and rye 2 bushels more. Probably 7 or 8 cart-loads of manure are applied to an acre of land before buckwheat or rye. Further E. the land improves considerably. Near Drenburg, the usual rotation is, first beans; then wheat, in which clover is sown; and after the clover, oats. Some of these lands are of a stiff texture, and on these it is usual to make a year's clean fallow; after which the same rotation is pursued.

When Mr. Jacob travelled in Holland, the turnip and potato culture were ill understood. Madder is very extensively grown in S. Holland, and usually produces 4,000 lbs. to the acre, but it tends to exhaust the most fertile soils. It is frequently followed by colewort, sometimes by turnips; to these succeed wheat or oats; after which the land is laid down to grass, the growth of which in a short period becomes very luxuriant. The land destined to the culture of tobacco in Guelderland is laid out in very small patches of not more than a quarter of an rood each, slightly fenced by a few dry sticks, around which scarlet runners are trained, to protect the plants against the wind. When gathered, the tobacco is hung on sticks in the houses and barns, and where the cultivation is extensive, large buildings, with sliding weather-boards, are erected, for the purpose of drying it. During the war, the project of supplying continental Europe with tobacco from its own soil, gave a temporary stimulus to its culture in Holland. Dutch tobacco soon rose to a high price, and large sums of money were laid out on its cultivation; but the article being very inferior to that of America, and more expensive, its price fell, after the peace, as rapidly as it had risen, and the capitalists who had embarked in the speculation suffered a heavy loss.

Pasture-farms, Cattle, and Dairy-husbandry.—The rearing of live stock and dairy-husbandry is a much more important source of national wealth than tillage. Between the capital and Utrecht, the land is almost wholly rich pasture, on which numerous cows are kept. The farms there seldom comprise more than from 50 to 100 acres. Their price, including buildings, averages 60*l.* an acre, though the rent they yield is scarcely more than 2*l.* per cent. interest on the capital. On these farms numerous cows are kept. The lean cattle, brought from Denmark and Germany, fatten with great rapidity in the Dutch polders, and an important branch of the trade of Friesland is the supply of the capital with fatted cattle. Artificial grasses are but little cultivated, and cattle are seldom stall-fed: indeed, it is too common to suffer the cows to remain in the open damp fields, both day and night, except in winter. The horned cattle of Holland are remarkable for their beauty; in S. Holland they resemble the Devonshire breed, but are rather larger, not, however, equalling the size of the Lincolnshire or Sussex cattle. The Dutch horses are good, and well adapted for draught; the best are those of Friesland; but many are reared in Groningen to be sent to Amsterdam. The breeds of sheep are bad or indifferent: they are mostly long-woolled, with white faces, polled, and long heads and legs. They yield a great deal of coarse wool.

In the neighbourhood of large towns it is found to be most profitable to retail the milk produced on the farms; but at a distance from such markets, it is nearly all appropriated to the making of butter and cheese. In some of the dairy farms near the Hague, the average stock is about 60 cows; and a good cow may be esti-

mated to produce 80 lbs. of butter, and 180 lbs. of cheese, during the six summer months. Throughout the greater part of Holland, butter is made of the cream only, and cheese of the skimmed milk; but in some districts the whole produce of the cow is devoted to making cheese. A good deal of butter is sent to England. The yearly export of cheese is estimated at 350,000 cwts. The dairy, the cows, and the cow-keeper's family occupy the same building, and in many instances the same apartment; but the cleanliness of the Dutch dispates any feeling of repugnance that the idea of such an arrangement might produce in a stranger.

A farm of 52 bunders in S. Holland requires, at an average, 5 servants, the family of the farmer assisting. The wages of servants vary from 60 to 150 florins a year; those of a maid-servant understanding the making of butter and cheese average 100 florins. The rate of day wages is, in summer, 18 to 20, and in winter, 14 to 16 stivers. The women are employed in the dairy business, in weeding, hay-making, and binding sheaves in harvest-time. The severer labour required in the making of cummin-seed cheese is generally performed by men, to whom also milking is often left. All regular servants board and lodge with the farmer, and eat at the same table with the family. Their food chiefly consists of wheat and rye bread, potatoes, turnips, French beans, bacon, fish and salt beef, and pancakes of buckwheat flour and bacon. Fewer servants are generally required on the farms in N. Holland. On one on which 30 cows are milked, a man and a woman, exclusive of the farmer and his wife, are sufficient. The wages of regular servants in N. Holland vary from 80 to 100 florins a year; they board and lodge with the farmer, but their food appears to be hardly so substantial as in the last-named prov. The wages of a day-labourer are about 20d., without food. The clothing of the labouring classes generally is much the same as in England—fustians, velveteens, and stout woollens for the men, and cottons and linsey woolsey stuffs for the women. Wooden shoes are, however, in pretty general use. *Jacob, Radcliffe, Chambers, &c., passim; Parl. Reports, 1837.*

Fisheries.—The herring fishery formerly carried on by the Dutch, though the most absurd notions were entertained by foreigners of its vast importance, was undoubtedly a considerable source of wealth and employment. It is now, however, confined within comparatively narrow limits, not employing more than about 80 *busses* of 50 or 60 tons burden, manned by 12 or 14 men each. The herrings cured by the Dutch are decidedly superior to those of the English or any other people. "The whole process is conducted on shipboard. Immediately on being caught, the herrings are bled, gutted, cleaned, salted, and barrelled. The bleeding is effected by cutting them across the back of the neck, and then hanging them up for a few seconds by the tail. By being thus relieved of the blood, the fish retains a certain sweetness of flavour and delicacy of flesh which unbled herrings cannot possibly possess. The rapidity of the process of curing must likewise aid in preserving the native delicacy of the animal; for the herring is salted and in the barrel in a very few minutes after it has been swimming in the water. The first herrings caught and cured, to the extent of two or three barrels, are instantly despatched, by a fast-sailing vessel, for Holland, where their arrival is anxiously expected. On their landing at Maas-sluis, one barrel, decorated with flowers, and with flags flying, is despatched to the Hague, as an offering to his majesty, who on this occasion presents the fortunate fishers with 1,000 guilders. The other barrels are sold by public auction, and generally fetch from 900 to 1,100 guilders. These precious barrels are then subdivided among the dealers, who retail them at a high price. A single herring of this first importation brings 1½ to 2 guilders,—that is, 2s. 6d. to 3s. 4d. each. So highly are they esteemed, that a single herring is considered a handsome present; and it is a custom to make such gifts to friends and acquaintances on this auspicious occasion. Livery servants may be seen passing through the streets with a plate, on which lie one or two herrings, covered with a fine white cloth and a neat card of presentation." (*Chambers, p. 48.*)

Manufactures.—The government of Holland is anxious to encourage manufactures, and coal, on which a heavy duty is ordinarily levied (in order to promote the use of peat, and the collateral formation of *pottery*), may be imported duty free, if for their use. The principal manufactures are those of woollen cloths, in Leyden and Utrecht; silks and velvets, in Utrecht, Haarlem, and Amsterdam; linens, cotton goods, in Haarlem; paper, leather, cordage, hats, ribbons, needles, white lead (the best made in any country), borax, glue, vermillion, saltpetre, tobacco, liquors, &c. There are numerous distilleries, and the town of Schiedam in S. Holland is particularly celebrated for its Geneva or Holland brandy. Amsterdam, and other places, have many sugar refineries. Haarlem has extensive bleaching factories, for which its water is supposed to be especially adapted. At Utrecht and Leyden, large quanti-

ties of tiles and bricks are made. Amsterdam is famed for its lapidaries and diamond cutters. Steam engines are employed to turn the machinery in the new and extensive cotton factory established at Haarlem; but in general windmills are used to perform offices to which steam engines are applied in Great Britain. Though most of the windmills are for the purpose of draining the land, a great many saw timber, crush rapeseed, grind snuff, &c. They are of larger dimensions than in England; the length of their sails varying from 80 to 120 ft.; they are always in sight in a Dutch landscape, and in the suburbs of the larger cities vast numbers of them are always congregated. They have all moveable roofs, so as to present their front to the wind at every change. The Dutch have attained to the highest excellence as millwrights, and some of their draining mills are of sufficient power to raise 700 tons of water to the height of 4 ft. in a minute! At an average, they discharge 250 tons a minute. The ships constructed by the Dutch are built mostly at Rotterdam and Amsterdam. They are stout without being clumsy or heavy; and round sterns, and the other modern improvements in naval architecture followed in our own dock-yards, are also practised in those of Holland. The Dutch E. Indiamen are handsome ships, well rigged, manned, and armed; and are not surpassed either in speed or durability by any similar class of merchantmen in Europe. (*Chambers, p. 7; Barrow, p. 101; De Cloet, pp. 43—64, 71—94.*)

Commerce.—The commerce of Holland was formerly the most extensive carried on by any European state; and the wealth which it brought into the country furnished her with the means of supporting the vast expence of her lengthened struggle with Spain, and of her subsequent contests with France and England. The circumstances under which the Hollanders have been placed, the natural poverty of their country, and the necessity of unremitting vigilance to prevent its being submerged, made industry and economy a condition of their existence. Holland being destitute of iron, coal, timber, and many other indispensable articles, the prosecution of commerce is there not a matter of choice but of necessity; and hence it is that, in the earliest periods, we find the Batavians distinguished for their fisheries, their shipping, and their commercial enterprise. For a lengthened period they engrossed nearly the whole sea-fishery of Europe; and they were long the carriers and factors of the principal European states. In 1694, the Dutch appeared, for the first time, in India, and, in the course of a few years, they wrested Ambeyna and the Moluccas from the Portuguese; and having obtained with them the monopoly of the spice trade, laid the foundations of an empire in the East, second only in magnitude and importance to that established at a later period by the English. Holland had long, also, a preponderating influence in the trade with the Baltic, from which she has, at all times, drawn a large supply of some of the principal necessities. But, without entering into particulars, it is sufficient to state, as illustrative of the former extent of her commerce, that in 1656, when it had attained to maximum, Sir William Pelly estimated the whole shipping of Europe at 2,600,000 tons, of which he supposed the Dutch to possess 900,000 tons; and it is believed, that this estimate was rather within than beyond the mark.

The decline of commerce in Holland was occasioned partly and principally by the natural growth of trade and navigation in other countries, and partly by the increase of taxation occasioned by the numerous contests in which the republic was engaged. During the occupation of Holland by the French, first as a dependent state, and subsequently as an independent republic, the French empire, her foreign trade was almost entirely destroyed. Her colonies were successively conquered by England; and, in addition to the loss of her trade, she was burdened with fresh taxes. But such was the vast accumulated wealth of the Dutch, their prudence and energy, that the influence of these adverse circumstances was far less injurious than could have been imagined; and, notwithstanding all the losses she had sustained, and the long interruption of her commercial pursuits, Holland was still, at her emancipation from the yoke of the French, in 1814, the richest country in Europe. Java, the Moluccas, and most of her other colonies, were then restored, and she is now in the enjoyment of a large foreign trade. This is in part owing to her extensive command of capital, and the possession of so fine a colony as Java, and in part to the advantageous situation of the country at the mouth of some of the principal continental rivers. This circumstance renders her an entrepôt for a considerable portion of the Continent; and gives her advantages that will necessarily continue to increase with the progress of the countries supplied through her intervention.

The connection of Holland with Belgium was an unfortunate one for both countries. The union was not agreeable to either party, and was injurious to the

former. Belgium was an agricultural and manufacturing country; and was inclined, in imitation of the French, to lay restrictions on the importation of most sorts of raw and manufactured produce. A policy of this sort was directly opposed to the interests and the ancient practice of the Dutch. But though their deputies prevented the restrictive system from being carried to the extent proposed by the Belgians, they were unable to prevent it from being carried to an extent that materially affected the trade of Holland. Whatever, therefore, may be the consequences as to Belgium, there can be little doubt that the separation between the two divisions of the kingdom of the Netherlands will eventually redound to the advantage of Holland. It must ever be for the interest of England, America, and all trading nations, to maintain the independence of a state by whose means their productions find a ready access to the great continental markets. It is to be hoped that the Dutch, profiting by past experience, may adopt such a liberal and conciliatory system towards the natives of Java, as may enable them to avail themselves to the full of the various resources of that noble and rapidly improving island. And if this, and freely open their ports, with as few restrictions as possible, to the ships and commodities of all countries, Holland may still be the centre of a very extensive commerce, and may continue to preserve a respectable place among mercantile nations. Even at this moment, after all the vicissitudes they have undergone, the Dutch are, beyond all question, the most opulent and industrious of European nations. And their present, no less than their former state, shows that a free system of government, security, and the absence of restrictions on industry, can overcome almost every obstacle; "can convert the standing pool and lake into fat meadows, clover the barren rock with verdure, and make the desert smile with flowers."

The merchants of Holland have never been charged with any want of enterprise. On the contrary, they have been, at all times, ready to engage in any adventure, however remote or hazardous, that held out a reasonable prospect of even a moderate profit. But, notwithstanding, Holland is, and always has been, a country of short credit. A discount is usually given for prompt payment, at the rate of 1 per cent. for six weeks, and of 2 per cent. for two months; but the terms of credit, on most articles, and the discount allowed for ready money, have been fixed by usage, and are regarded as essential conditions in all bargains:—"Rien, en effet, de plus facile que de s'établir à Amsterdam; mais rien de plus difficile que de s'y soutenir sans de grandes ressources." Dans cette ville, où l'argent abonde, où on le prête contre des sûretés à si bon marché, il est pourtant impossible de s'en procurer à crédit; et sans argent, il n'y a pas plus de possibilité d'y travailler, que de trouver quelqu'un qui veuille se charger d'un papier nouveau qui ne serait pas appuyé d'un crédit que l'opinion, la perspective, ou des effets réels feraient valoir à la bourse. Les Hollandais suivent à-dessus des maximes très-sûres même à l'égard des maisons d'une certaine considération. Il est extrêmement difficile de trouver sur la bourse des personnes qui prennent du papier d'un négociant pour des plus fortes sommes que celles qu'il peut comporter les affaires qu'on lui connoît." (*Ricard, Traité Général du Commerce*, l. 212. ed. 1781.)

This extraordinary caution is not, however, a disadvantage, but the reverse. It hinders commerce from degenerating, as it has done in other places, into gambling adventures, and places it on a comparatively solid foundation. As a proof of the excellence of this system, it is enough to state, that bankruptcies are rarer in Holland than in any other country. Notwithstanding the loss and interruption to all sorts of businesses, occasioned by the occupation of the country by the French in 1795, the failures in that and the subsequent season were not, comparatively, so numerous as in England in ordinary years. And during the convulsions that grew out of the separation of Belgium from Holland, no suspicion was ever entertained of the solvency of any considerable Dutch house.

The imports principally consist of sugar, coffee, spices, tobacco, cotton, tea, opichineal, indigo, wine and brandy, wool, grain of all sorts, timber, pitch and tar, hemp and flax, iron, hides, linen, cotton and woollen stuffs, hardware, rock salt, tin plates, coal, dried fish, &c. The exports consist partly of the produce of Holland, partly of the produce of her possessions in the East and West Indies, and other tropical countries, and partly of commodities brought to her ports, as to convenient *entrepôts*, from different parts of Europe. Of the first class, are cheese and butter (very important articles), madder, clover, rape, hemp, and linseed, rape and linseed oil, Dutch linen, &c. Geneva is principally exported from Schiedam and Rotterdam; oak bark principally from the latter. Of the second class are spices, Mocha and Java coffee; sugar of Java, Brasil, and Cuba; cochineal, indigo, cotton, tea, tobacco, and all sorts of Eastern and colonial produce. And of the third class, all kinds of grain, linsens from Germany, timber, and all sorts of

Baltic produce; Spanish, German, and English wools; French, Rhineish, and Hungarian wines, brandy, &c. The trade of Holland may, indeed, be said to comprise every article that enters into the commerce of Europe. Her merchants were formerly the most extensive dealers in bills of exchange. And though London be now, in this respect, far superior to Amsterdam, the latter still enjoys a respectable share of this business. We subjoin an account of the quantities of the principal articles of produce imported from Holland into the United Kingdom in the year 1838.

Articles.	Quantities.	Articles.	Quantities.
Bark for tanning and dyeing	186,786 cwts.	Flax and tow	191,802 cwts.
Butter	164,514	Madder	49,866
Cheese	225,694	Nutmegs	110,487
Cloves	121,965 lbs.	Mace	3,613
Wheat	82,010 qrs.	Clover	14,876
Oats	25,681	Flax Seed, &c.	45,650 bush.
		Geneva	483,084 galls.

The subjoined account shows that the trade of this country with Holland is rapidly increasing. **ACCOUNT of the declared Value of British and Irish Produce and Manufactures exported from the United Kingdom to Holland, from 1833 to 1838, inclusive.**

Year.	Value.	Year.	Value.
1833	£ 2,181,895	1836	£ 2,509,622
1834	2,470,367	1837	3,040,029
1835	2,644,402	1838	3,519,439

There belonged to Holland, in 1837, exclusive of small craft, 1,394 ships, of the burden of 111,824 lasts. During the same year, there entered the different ports 2,565 ships under the national flag, 964 do. under the British flag, and 1,858 under other foreign flags. (For further details as to the trade of Holland, see *AMSTERDAM, ROTTERDAM, &c.*)

Money—Weights and Measures.—The most common coin, and that by which accounts are generally reckoned, is the guilder, or Dutch florin, equivalent to 1*s.* 8*d.*, and divided into 20 silvers (*1*d.**) and 100 cents (*cent = 1/5th of a penny*). The dollar is worth 2*s.* 6*d.*, and the rix-dollar 4*s.* 4*d.* Eng. The William, a gold coin, is valued at 17*s.* The Dutch schilling is 3 quintals, the quintal 100 lbs., and the liepspond 16 lbs.: 100 lbs. Dutch are equivalent to 108 lbs. English. The Dutch quart is equal to 6*s.* 10ths gal. Eng. The Dutch foot = 11.7 in. Eng.; the ell = 27.1 in. Eng. The Dutch mile, or league, = 2*1/2* Eng. m. nearly.

Government.—Previously to its occupation by the French in 1795, and its subsequent erection into a kingdom by Napoleon, Holland was a republic, governed by the states-general, with the executive power lodged in the hands of a stadholder. And there can be no question that the great commerce of the Dutch in the 16th, 17th, and 18th centuries, their wealth and industry, were materially promoted by their free institutions and the nature of their government. At a time when England, France, and most other European states, were a prey to civil wars, caused by religious and political differences, the Dutch had the wisdom to establish and maintain a system of universal toleration, and to make their country an asylum for all persecuted and oppressed strangers. Though complex and not very popular, in practice the constitution gave free scope to all deserving individuals to attain to the highest dignities, at the same time that it effectually secured them against violence and oppression. The utmost latitude was given to every one to dispose of property by will as he thought best; justice was speedily and impartially administered; and though taxation was heavy, the revenue was faithfully and economically expended. Hence the political conspiracy with the physical circumstances under which the Hollanders were placed to call forth their talents and enterprise, and to render them industrious and economical. That the difficulties incident to their situation, the *avari* *wreng* *in rebus equestis*, have done much to make them what they have been and what they are, cannot be disputed; but it is easy to see that they are, at the same time, largely indebted to the freedom of their civil and religious institutions. Holland is now a constitutional monarchy, hereditary in the family of the Princes of Orange, the founders of the independence of the country, and in whom the office of stadholder was latterly made hereditary. The king is also grand duke of Luxemburg, in which capacity he belongs to the German confederation. His person is inviolable, his ministers alone being responsible; he nominates to all civil and military offices, proposes and promulgates the laws, declares war or makes peace, and holds, in his own hands, the entire government of the colonies. The states-general consist of 2 chambers: the first is composed of from 40 to 50 members, nominated for life by the king, who must be already 40 years of age, and who receive each about 250*l.*

a year for travelling expenses. The second chamber consists of 56 deputies of the nobility, towns, and rural districts of the several provinces; Holland sending 22, N. Brabant 7, Guelderland 6, Friesland 6, Over-Yssel and Groningen 4 each, Zealand and Utrecht 3 each, and Drenthe 1. Luxembourg has its own separate diet. The states-general are convoked annually, and one third part of the second chamber is annually re-elected. The system of election is indirect, and very far from popular. In towns, for example, the plan is, for the higher order of ratepayers to elect a certain number of persons called *kiesers*, or choosers, who elect the *raad*, or town-council, which is chosen for life; the town-councils send deputies to the different provincial governments, and the latter elect the members of the states-general, or commons. It is plain, that in this plan a preponderating influence is vested, in so far as the city representation is concerned, in the *raads*, or town-councils; and these being elected for life, and consequently exempted, in a great degree, from popular control, it is clear that their representatives in the provincial councils and states-general, cannot be expected to have much sympathy with the public. The system tends, in fact, to establish a government by an oligarchy; and is, in many respects, most objectionable. The states-general impose all taxes and imposts; but the financial budget, instead of being debated, as in England, every year, is voted for 10 years; so that, during the intermediate period, the chamber is, as it were, deprived of its most important function; but this regulation is much complained of, and will, most probably, be speedily changed. All persons are eligible to public offices, without distinction of religion, and all are equal under the law.

The different provs. have each its own states, composed of deputies of the 3 orders of the pop. above mentioned. The deputies for the rural districts, like the members of the different town-councils, are elected at second hand by bodies of *kiesers*, chosen in the different districts; and the qualification required in voters for the *kiesers* being such as greatly to restrict their numbers, the country representation is but little more popular than that of the towns.

Justice.—The different provs. have their own local magistracy and laws established by their own states; the judges are nominated by the king for life, on the recommendation of the provincial states, or the states-general. The provs. are divided into arrondissements, cantons, and communes, similar to those of the French depts., and superintended in like manner. The local courts are also similar to those of France; in each canton there is a court of justices of the peace, and in each arrond. one of original jurisdiction: there are tribunals of commerce in the principal commercial districts. The supreme judicial court, and high board of taxation (*cour des finances*), sit at the Hague, which is also the usual residence of the court. Trial by jury is not in operation; in other respects, the mode of administering justice is much the same as in France. The police is under the control of a central director, a sub-director in each prov., and commissaries in the arrondissements. Perhaps no country has so little crime; of 3,165 individuals were in confinement throughout 1836. The systems of prison discipline and correctional police are admirable. No mendicants or disorderly persons are suffered to offend the public eye, and education is carefully administered to juvenile offenders. There is no imprisonment for debt, except in the case of dishonoured bills. (*De Cloet*, pp. 121—124; *Chambers*; *Parl. Report*, 1837.)

Religion.—By the last census, the pop. was divided into 1,541,798 Protestants, 836,920 R. Catholics, and 48,493 Jews, besides a few thousands belonging to other sects. The Calvinist or Reformed Church of Holland is professed by the reigning family as well as the greater number of the inhabitants, and is very similar, in most respects, to the Presbyterian church of Scotland. In 1838, the number of persons belonging to this establishment was 1,518,700. It may therefore be called the religion of the state; but since Holland threw off the yoke of Spain, it has always been distinguished by its religious freedom and toleration, and at this moment, the clergy of all religious persuasions receive salaries from the public purse. The ministers of the Dutch reformed church are allotted to certain districts in proportion to the pop.; there being 1 pastor generally to about every 2,000 or 3,000 people. Their *maximum* salary is 200*l.*; their *minimum* 50*l.* The sum expended in ecclesiastical stipends, in 1840, was 1,737,000 guilders.

The *Military Force* amounts, at present, to about 42,000 men; but in time of war it may be readily raised to 70,000. It is maintained by voluntary enrolment, or by engagements for a limited time, and augmented by the recall of those who have served, and by calling out the militia, which latter body is composed of all the youth between the ages of 19 and 32. The principal fortresses, next to Luxembourg, are Maestricht, Breda, Bergen-op-Zoom, Bole-le-Duc, Flushing, and the Heider. Luxembourg is at present garrisoned by Prussian troops.

The *Navy* consists at present (1839) of 6 ships of the line, the largest carrying 84 guns; 21 frigates; 15 corvettes; 21 brigs; and 96 gun-boats. There are 473 officers, and the crews in active service amount to about 5,000 men.

The *Public Revenue* is derived from a heavy land-tax, or *contribution foncière*, from numerous and heavy personal and assessed taxes, excise duties, which, among other articles, are imposed on turf, coal, &c., and from taxes on stamps, registrations, tolls, harbour dues, customs, the post-office, lotteries, &c.; but still the revenue is usually less than the expenditure. The estimate of the latter, for 1840, as given in the budget, was as follows:—

	Florins.
1. The King's household	1,425,000
2. The Secretary of State and Superior Boards	834,100
3. Foreign affairs	831,600
4. Justice	1,458,000
5. The Interior	3,222,000
6. The Reformed Church	1,291,200
7. The Rom. Cath. Church	400,000
8. The marine	5,250,000
9. Finances:—A. National debt	21,456,205
B. Departmental expenses, pensions, &c.	6,111,795
10. War	14,191,500
11. The colonies	94,000
Total	66,378,800

Besides 5,600,000 florins for paying the interest of the 5 per cents., and 500,000 florins for extraordinary expenses.

The ways and means during the same year were estimated at 56,346,298 *fl.*; but in this sum is included the large item of 11,220,000 *fl.*, which, it is taken for granted, will be furnished from the revenue of the colonies! But it is very problematical whether this last item will be realised; the more especially as it depends on the negotiation of a loan for the colonies!

The truth is, that taxation in Holland is very oppressive, and that the state of the finances is very far from satisfactory. This unfavourable state of things has arisen partly, and principally, from the great public debt of the kingdom (amounting probably to about 165 millions sterling), and the necessity of providing for the interest thereon; and partly, from the disproportionately heavy expenses the kingdom has latterly had to sustain from the uncertain state of her relations with Belgium and the disputes as to Luxembourg and Limburg. Now that this uncertainty is well nigh put an end to, and that the disputes in question have been adjusted, it is to be hoped that some material deductions may be made from the annual expenditure. Since 1830, it has almost uniformly exceeded the income; and there has, in consequence, been a constant increase of the public debt. The Dutch are too sagacious a people not to see in what this state of things, if not obviated, must necessarily terminate; and hence the growing dissatisfaction with the budgets. A nation may advantageously contract debt during war; but a nation unable during peace to provide for her expenditure must either retrench or prepare for bankruptcy, or, perhaps, revolution!

Provision for the Poor, and Charitable Institutions.—Though pauperism be discouraged, and mendicancy punished, the Dutch are very charitable and liberal in their support of the poor. The institutions for the relief of the indigent consist of *hospices* for the aged and infirm, orphan-houses, workhouses for towns and districts, the poor colonies, and private charitable institutions. The funds for their support are mostly derived from endowments and voluntary contributions, the direct tax not being more than about 1,800,000 *fl.*, or 160,000*l.* per annum. Boxes, inviting the donations of by-passers for their relief, are stationed in many public ways: the establishment of any new public work excites a fresh call on behalf of the poor; and a tax of about a penny in a shilling, to the same end, is levied on tickets to all places of public amusement. The hospitals, asylums, and other charitable foundations, are very numerous in the towns: in Amsterdam only there are 23. (*Chambers*.)

An institution worthy of particular mention is the "Society for the Promotion of the Public Good," an association which originated in 1784 with a few benevolent individuals, but which has now 220 branches throughout Holland, and is supported by 14,000 members, each of whom pays a small sum—about 10*s.*—yearly. Under the direction of this society, savings' banks, libraries, schools of various kinds, including those for the higher branches of knowledge, &c., are established; prizes and rewards are given for superior essays, works of art, or acts of humanity; and in the winter season, public lectures on literary, scientific, or moral subjects are delivered. The establishments of this society formerly extended into Belgium; but since the revolution of 1830, they have mostly ceased to exist in that country. (*Chambers*, pp. 14—18 34, 35; *Nicholls's Reports*.)

Among the classes able to labour, a state of even

temporary dependence is considered disgraceful, and great exertions are made by the labouring population to avoid it. No sense of degradation attaches to orphan establishments. There are 3 great workhouses for the whole of Holland,—one at Amsterdam, another at Middelburg, and the third at Nieuwe-Pekel-A, in Groningen. In these the inmates work at looms, &c.; the sexes are kept strictly separated; the food is very inferior and somewhat scanty, the clothing coarse; and the inmates are not suffered to go abroad. All beggars are apprehended by the police; if aged or infirm, they are sent to the workhouses,—if able to work, to the penal colonies. In the latter establishments, the paupers labour with the spade, in brick-making, or in manufactures. Guards on horseback, who patrol the boundaries of the colony; rewards given to those who bring back any colonist that has attempted to escape; and a uniform dress, are the means adopted to prevent desertion from these settlements.

Public Education — Public Press. — Holland has been much and deservedly celebrated for its system of public education. In England, in 1833, only 1 in 11 of the pop. was receiving primary instruction; in the Dutch provs. of Drenthe and Over-Yssel, in 1835, the proportion was about 1 in 6 (*Duportiaux, L'Instruction en Belgique*, &c. p. 103.); and throughout Holland generally it is 1 in 8. There is scarcely a child 10 years old, of sound intellect, who cannot both read and write; almost every one receives instruction at some period, the expense of which is for the most part, and in some instances entirely, defrayed by the state, without the fluctuation of any particular religious creed, the interference of the government being exerted only to exclude improper and incompetent teachers, and to regulate the mode of instruction by a system of inspection.

The department of education is under the superintendence of the minister of the interior, assisted by the inspector-general of instruction, from whom all changes and new regulations emanate. The inspection of schools is devolved chiefly upon local inspectors, of whom there are 70, or one for each school district into which the kingdom is divided. These inspectors are assisted by local boards; and each inspection is responsible to the provincial board for the efficiency of the schools within his district; the provincial board being itself responsible for its proceedings to the minister of the interior and the inspector-general. In Holland, no person can open a public school, or even receive private pupils, without first having received a certificate of his ability to teach, granted after inquiry and examination by a board of examiners consisting of district surveyors, who meet for this important purpose. This board grants four sorts of certificates, but only one is granted at a time; and to obtain the highest certificate, four successive examinations must be undergone at different intervals. Having obtained his certificate, the candidate must next apply for leave to open a school to the school committee of the town or district in which he proposes to establish it, who do not grant his request unless when they think such additional school is really required. Very grave doubts have been and may be entertained as to the policy of this last regulation, but there can be none as to the policy of subjecting all persons intending to open schools to the necessity of undergoing an examination as to their fitness. The utility and importance of this regulation are alike obvious and undoubted; and we have no hesitation in saying, that its adoption in this country would do ten times more to improve education than all the measures that have been adopted with respect to it during the last century. The district inspectors assemble three times a year in the chief town of their respective provs., where they hold a conference, each inspector making a report, in the presence of the provincial governor, on the state of education in his district. Sometimes the governor assembles a council at the Hague, consisting of deputies from each provincial board of education, when every thing pertaining to the system is discussed and reviewed in presence of the minister of the interior and the inspector-general. (*Cosm. on Education in Holland; Eng. Trans. Westminster Review*, No. lvi., &c.)

In 1835, there were, in Holland, 2,839 primary schools (2,190 public, and 642 private), attended by 304,489 pupils, whose instruction cost the state 381,480 francs, or 1 fr. 25 cent. each. In the same year there were 63 Latin schools, attended by 1,265 students, and costing the state 79,880 fr., or 6 fr. 63 cent. each individual. There are 3 universities — those of Leyden, Utrecht, and Groningen, — which, with the atheneum of Franeker in Friesland, had, in the above year, 1,571 students, the expense to the state of whose education was 613,140 fr., or 300 fr. 25 cent. each. By the royal ordinance of 1815, an atheneum was to be established in 6 of the 9 provs.; but, excepting that of Franeker, already named, only one, at Harderwyk in Guelderland, is supported by the state. There are two normal schools for the education of teachers in Holland; one at Groningen for the N. provs., and the other at Haarlem for the centre and S. of Holland.

The primary schools are divided into *Armen*, or poor, and *Tweeschou*, or intermediate, schools. In both pretty much the same kind of instruction is afforded, including reading, writing, arithmetic, geography, the history of Holland, and vocal music; but the latter are attended by the children of parents above the condition of the poor, and the fee, though still very trifling, is somewhat higher. In the poor-schools, as in all the rest, a small sum is generally paid, and in many instances daily, by the parents of the children educated. This circumstance does not retard the progress of education amongst the poor, but has perhaps rather a contrary effect, inasmuch as it removes that sense of degradation which frequently associates itself with the notion of receiving eleemosynary instruction. No law, as in Prussia, exists in Holland directly compelling parents to send their children to school; but the poor are not allowed relief from the public funds unless they comply with this regulation. There is, however, little need of such a proviso, since a just sense of the great value of education is found to exist amongst all classes. (*Nichols's Report*.) In the superior private schools German, French, English, and other modern languages are taught, in addition to the ordinary elementary branches of knowledge. In the Latin schools, which are analogous to the *gymnasias* of Germany and the colleges of France, pupils are instructed in Latin and Greek, the modern languages, mathematics, physics, geography, history, and the other higher branches of education, for the most part as preparatory to their studies at the atheneums or universities.

In these seminaries, pupils of all religious persuasions are received indiscriminately, and at stated times attend their respective clergymen for religious instruction. The monitorial system of teaching is scarcely at all introduced. The public schools, like the public charities, make little or no outward display, and are conducted on the most rigid system of economy. The efficiency of the elementary instruction supplied by the schools in Holland is universally admitted; but, with all its excellence, the course of education comprises only the more elementary divisions of mental culture; the study of philosophy, of the principles of politics and political economy, of the higher branches of literature — of all those pursuits, in short, that tend to expand and elevate the mind, is comparatively neglected. Still, however, it is abundantly certain, that the low state of the higher branches of literature in Holland is not owing to any defects in the system of education, but to the vexatious restraints laid on the freedom of the press. Neither political nor moral science can flourish where the press is restricted; and in Holland, no book, newspaper, or even so much as a handbill can be printed without a license, specially granted on application. There are in Holland 14 literary journals, but only 2 or 3 rise above insignificance. There are, also, some religious journals, a few almanacs, and 25 newspapers, but none of the latter deserves to be cited, and some of them are mere trading circulars. Certainly, however, the Hollanders of the present day are nowise inferior to their ancestors in the days of Erasmus and Grotius. The different circumstances under which they are placed accounts for the wide difference between them. Remove the shackles from the freedom of the press, popularise the government, and give free scope to genius and invention, and we venture to say, that the literature of Holland will again rank with the first in Europe.

The Dutch school of painting has attained to great celebrity. Its masters excel chiefly in delineations of common life, and animated objects: in accuracy and excellence of colouring, and the management of light and shade, they are surpassed by none. But the subjects of their pictures are not, unfrequently, so very coarse, vulgar, and low, as to be, in many respects, the disgrace of those of the Italian school. The Dutch school can boast of Rembrandt, Teniers, Jan Steen, Ostade, Gerard Dow, Mieris, &c.: besides whom, Wouvermans, Paul Potter, Berghem, and Ruysdael excel in landscapes and cattle; Vanderveelde and Backhuysen in sea-views; and Weenix, Hondekoeter, Vandenheyden, Heemskirk, Breghef, &c. in other departments. Many of the best works belonging to this school are to be found in Holland, and especially in the galleries of the Hague, Amsterdam, and other chief towns. The Dutch are fond of music, but they do not excel in it. (*De Cloot*, pp. 99—102; *Chambers's Murray's Handbook*.)

People, their Customs, &c. — Of about 2,600,000 inhab. in Holland (exclusive of Luxembourg) in 1831, 1,908,000 were Dutch, 280,000 Walloons or Flemings, 252,000 of German descent, 180,000 Frisians, and 50,000 Jews. (*Journal de Travaux*, &c.) In stature, the Dutch are much the same as the English: the women are comparatively taller than the men; they are decidedly handsome, and, when young, have naturally good complexions, which they might preserve to a later period, did they take more exercise in the open air, and abandon some injurious customs, such as the incessant use of the *chauffepied*, a

box of burning peat, which accompanies them every where. "Nothing," says Mr. Nicholls, "can exceed the cleanliness, the personal propriety, and the apparent comfort of the people of Holland. I did not see a house or fence out of repair, or a garden that was not carefully cultivated. We met no ragged or dirty persons, nor any drunken man; neither did I see any indication that drunkenness is the vice of any portion of the people. I was assured that bastardy was almost unknown; and although we were, during all hours of the day, much in the public thoroughfares, we saw only two beggars, and they in manners and appearance scarcely came within the designation. The Dutch people appear to be strongly attached to their government, and few countries possess a population in which the domestic and social duties are discharged with such constancy. A scrupulous economy, and cautious foresight, seem to be the characteristic virtues of every class. To spend their full annual income is accounted a species of crime. The same systematic prudence pervades every part of the community, agricultural and commercial; and thus the Dutch people are enabled to bear up against the most formidable physical difficulties, and to secure a larger amount of individual comfort than probably exists in any other country." (*Report on the Poor of Holland, in 1838.*)

The women are very domestic in their habits, and carry cleanliness in their houses to the greatest possible extent; though personal cleanliness does not always receive the same attention. The ancient national costume, the wide breeches, full petticoats, and broad hat, are now mostly confined to the fishers and peasantry; in the towns, the people dress like the French and English. The most remarkable element of costume in use is the head-dress of the Friesland women. The latter, who are the descendants of the ancient *Frisii*, so often referred to by Tacitus, and whose blue eyes, faxen hair, and fresh ruddy complexions declare them to be of the Gothic race is perhaps its greatest purity, wear on both sides of the head large plates of gold or silver, connected together by a band of the same metal passing behind, and ornamented with two singular appendages, of a ram's-horn shape, to which are attached pendants of various kinds. The whole is covered by a rich cap of lace: it not unfrequently costs 16*l.* or 20*l.*, and often composes the whole dowry of a Friesland girl. The Dutch, though in general frugal, live well and substantially. Coffee, tea, beer, and native gin, but especially the first, are the favourite drinks: the tobacco-pipe is in universal use amongst all classes. The houses in the towns do not aim at any external grandeur, and are in general plainly furnished; but those who can afford it are extremely fond of collecting china, and other kinds of curiosities. The *lusts*, or pleasure-houses forming the residences of retired merchants, are mostly built on the same plan. "These edifices are usually of brick, plastered and painted to look as trim and tidy as if just taken out of a box; and, with their close-shaven bit of lawn in front, their complex wet ditch separating the domain from the public thoroughfare, their little bridge, dashing wooden gateway, clusters of dahlias, fresh painted summer-house," &c. form the *beau-ideal* of a Dutchman's wishes. On the gateway there is invariably some motto, indicative of the taste or temper of the owner.

The Dutch are very regular in their habits; precision, decorum, and a fixed routine govern every thing. Intoxication is, generally speaking, very rare; but in September an annual festival takes place, which lasts for 10 days, during which great excesses are said to be committed. So soon, however, as this festival terminates, the people return at once to their former habits of sobriety till the next yearly occasion. Their amusements are not very intellectual, nor do they include many sports out of doors. They are mostly similar to the entertainments afforded by the tea-gardens and secondary theatrical establishments in England. (*Chambers; Lettres sur la Hollande.*)

History.—In the time of the Romans, Holland was inhabited chiefly by the *Batavi* and *Frisii*, the former of whom, after the conquest of Belgium by Julius Cæsar, concluded an alliance with the Romans. This was afterwards silently changed into subjection to Rome, and it is said that Claudius Drusus, a Roman governor, about the beginning of the Christian era, erected the first dyke to ward off the encroachments of the sea. In the reign of Vitellius, the Batavians endeavoured unsuccessfully to throw off the Roman yoke; in the 3d century, their country was overrun by the Saxons; in the 8th it was conquered by Charles Martel; and it subsequently formed a part of the dominions of Charlemagne. From the 10th to the 14th century, the Netherlands were divided into many petty sovereignties, under the dukes of Brabant, the counts of Holland and Flanders, &c. In 1383, however, by marriages and otherwise, the whole passed into the hands of the dukes of Burgundy; thence to the house of Austria; and lastly, in 1548, under the rule of the Emp. Charles V. The union with Spain was a most unfortunate event for Holland. The Dutch had

long been in the enjoyment of many political rights and privileges; they had extensive fisheries and trade, and they had for the most part embraced the doctrines of the early reformers. Philip II., who regarded the privileges enjoyed by the Dutch as usurpations on his own prerogative, and who detested the reformed faith, resolved to recover the former, and to suppress or extirpate the latter. To accomplish this purpose, he sent, in 1567, Ferdinand de Toledo, Duke of Alva, with a powerful army into the Low Countries. But the proscriptions and massacres with which this sanguinary though able soldier filled the country, failed of their object. The Dutch, instead of being subdued, were at length driven into open rebellion. The malecontents captured the Briel in 1572; and after a struggle unequalled for duration, for the sacrifices it imposed on the weaker party, and for the importance of its results, the independence of the republic was acknowledged by Spain in 1609. Except that it was occasionally darkened by internal feuds, the half century that succeeded this event is the brightest in the Dutch annals. The commerce of Holland attained to an unrivalled magnitude; and while she extended her colonies and conquests over some of the most valuable provinces in the E. and W. Indies, she successfully resisted the attacks of Louis XIV., contended with England for the empire of the sea, and was justly regarded as one of the bulwarks of the Protestant faith.

From the death of Louis XIV. down to the French revolution, the influence of Holland gradually declined, not so much from any decay of her own resources, as from the growth of commerce and manufactures in other states, especially in England. The policy of Holland had long been peaceful; but that could not protect her from being overrun by revolutionary France. In 1806 she was erected into a kingdom for Louis, a brother of Napoleon; and, on the downfall of the latter, she was united with Belgium, and formed into a kingdom, under the family of Orange, the founders of her liberties. But this union was never cordial. The Dutch and Belgians are, in fact, totally dissimilar in their religion, character, and pursuits; and the connection between them was dissolved by the revolt of the Belgians soon after the French revolution of 1830. Holland, therefore, has now pretty nearly the same limits as before her occupation by the French in 1795. The King, William I., abdicated the throne in favour of his eldest son William, now William II., in 1840 (*Dict. Cyclop. Géogr. Historique, &c.* pp. 9–19; *Dec. Géogr.; Chambers, &c.*)

HOLSTEIN. HOLSTEIN, a duchy at the N.W. extremity of Germany, belonging to Denmark, bounded W. by the North Sea, S. by the Elbe, E. by the Baltic, and N. by Sleswick. It is of a compact form, comprising an area of about 3,330 sq. m.; and had in 1834 a pop. of 435,528. Surface and soil considerably diversified; the E. part is somewhat hilly, and, besides fertile plains, has woods, lakes, and picturesque scenery; the middle part is comparatively barren, and is in many parts covered with sand; the W. district along the Elbe and the German Ocean, consists principally of flat, low-lying, rich marsh land, secured by dykes and sluices against the overflows of the sea. Principal rivers Elbe and Stör; the only lake worth notice is that of Flen. The canal of Kiel separates the duchy from Sleswick, and is of great importance, as well for inland as for foreign navigation. (See KIEL.) The lat. of Holstein being the same as that of the N. of England, its productions are also similar, consisting of wheat, barley, and oats; potatoes, hemp and flax, with hops and fruit, &c., but it is chiefly celebrated for its excellent cattle and horses, raised in large numbers in the luxuriant pastures of the marshland, and which are an important article of export. The half-dried beef, so abundant in Hamburg, and which is decidedly superior to any thing of the sort met with in this country, is principally derived from Holstein. Agriculture has been much improved; and the country being in many parts enclosed and well cultivated, is little inferior, in appearance, to the best districts of England. Minerals are very important. Lime is, however, met with; and there is a brine spring at Odersloe. Fishing is prosecuted to some extent along the coasts. The only important sea-port is Altona, near Hamburg. Gluckstadt, a much smaller sea-port, situated lower down the Elbe, is the cap. of the duchy; but the states (see DENMARK) meet at Itzehoe, a town of 5,600 inhab. The other principal towns are Rendsburg and Kiel. Exclusive of cattle and horses, wheat, oats, barley, &c., with butter and cheese, are exported. Manufactures, excepting those carried on at Altona, unimportant.

HOLYHEAD (in Welsh *Caeer-Gybi*, "the castle of Gybi"), a sea-port, parli. bor., market town, and par. of N. Wales, on a peninsula at the W. extremity of the Isle and co. Anglesey, 22 m. W. Bangor, 67 m. W. Liverpool, and 224 m. N.W. London; lat. 53° 17' N., long. 4° 35' W. Pop. of par., in 1831, 4,292. The peninsula, on the N. side of which the town stands, and which is insulated at high water, ends, towards the sea, in an immense

precipice of serpentine rock, hollowed out here and there into most magnificent caves, the haunts of almost innumerable sea-fowl. The town is clean and well paved, comprising two main, and several cross streets; it has a fine open market-place, public baths, government establishments, &c., and contains many superior residences. The church, formerly collegiate, and now in the patronage of Jesus College, Oxford, is an embattled cruciform structure, in the decorated English style, with a square tower and low steeple; and the churchyard is enclosed by a low wall, said to have formed part of a Roman fortification. There are also four places of worship for dissenters, a free school, established in 1745, and several other day and Sunday schools, furnishing instruction to a great many children. Holyhead has no particular branch of commerce or manufacture: its importance principally depends upon its being, next to Liverpool and Bristol, the chief resort of passengers to and from Ireland. The erection of the Menai Bridge, the improvement of the Holyhead road, and the establishment of steam-packets to Dublin, caused a great increase of the intercourse by Holyhead. But the removal of the London and Dublin mail packets to Liverpool, in 1838, greatly diminished the number of passengers by this route. (*Bownd. Rep.*) One mail packet, however, still continues to run; and there is considerable business in shipbuilding and in the coasting trade. The harbour, which forms a basin in the shape of a horse-shoe, used to dry at low water; but great efforts have been made of late years to improve it; and a pier has been projected about 200 fathoms into the sea, having 13 ft. water at its head at low springs. This pier, formed on the rocky island of St. Gylb, is joined to the town by a swivel bridge, and at its other extremity is a lighthouse. The peninsula of Holyhead is terminated by a high rocky promontory called the S. Stack, surmounted by a lighthouse, with a revolving light, 211 ft. above low-water mark. The Skerries, a small island 7 m. N. of Holyhead, is also marked by a lighthouse. The town of Holyhead, and its surrounding suburb, is a parl. bor. contributory to Beaumaris, which returns 1 mem. to the H. of C. Markets on Saturday. (*Nicholson's Camb. Guide: Bownd. Rep., &c.*)

HOLY ISLAND (an. *Lindisfarne*), a peninsula, wholly insulated at high water, on the N.E. coast of England, co. Durham, ward Islandsire, 11 m. S.E. Berwick-on-Tweed. Area, 3,390 acres: pop., in 1831, 836. Its form is that of an irregular four-sided figure, more than half of it towards the N. being covered with sand, and abounding with rabbit-burrows: the remainder, however, has been very productive since its enclosure in 1796. The prospect from the island is extremely beautiful, commanding glews, northward, of Berwick, and of Bamburgh Castle, at nearly the same distance, southward. At the S.W. angle of the island is a small fishing village, formerly more extensive, near which are a small harbour and an old castle, situated on a high conical rock, of primitive formation. The inhabs. are chiefly engaged during winter in catching lobsters for the London market, and at other times in getting coal, ling, and barlock. Limestone, coal, and iron ore are abundant; but the influx of the tide makes the working of them exceedingly laborious. The great glory of the island, highly esteemed by Anglo-Saxon scholars, is the abbey (with its connected church), formerly the residence of many literary monks. It was founded by St. Aidan in 635, under the patronage of Oswald, king of Northumbria, who erected Lindisfarne into a bishopric. The monastery was all but demolished by the Danes, in 967, and was then renewed (with the bishop's see) to Durham, a few monks only remaining at the establishment after the partial rebuilding of the church and abbey. The ruins of the abbey, which had been constructed of red freestone, and aptly termed by Sir W. Scott "a solemn, large, and dark red pile," show that it was built at different periods. It cannot be better described than in the words of the great minstrel in the 3d canto of Marmion:—

In Saxon strength that abbey frown'd,
With massive arches broad and round,
The roof salt-peter, red and rose,
On ponderous pillars short and low.
Bulls are the art was known,
By polished stone and shafted stalk,
The arcades of the alley's walk
To emulate in stone. * * *

Not that that portions of the pile,
Rebuilt in a later style,
Show'd where the spoiler's hand had been.

Various fragments of the monastery are extant, and traces of walls are scattered over a space of nearly 4 acres. The main walls on the N. and S. sides of the church still remain, the measurement of the building being 138 ft. in length, and 36 ft. in breadth. S. of Holy Island are 17 small islands, called the *Fine Islands*, on the largest of which is a lighthouse. (*Hutchinson's & Surtees's Durham: Views of Coast and Harbours of England.*)

HOLYWELL, a market town, parl. bor. and par. of N. Wales, co. Flint, hund. Mold, on the great road from Chester to Holyhead, 144 m. W. by N. Chester, 56 m. N.N.W. Shrewsbury, and 178 m. N.W. London. Area of par., 1,790 acres; pop., in 1831, 8,969. The town is pleasantly situated on the slope of a mountain extending towards the estuary of the Dee, and is large, well paved, and lighted with gas. The streets are irregular; but there are many good and substantial houses. The church, a plain structure, with a strong embattled tower, stands quite at the bottom of the hill: there are also 3 Roman Catholic chapels, and several places of worship for dissenters. A beautiful Gothic chapel, dedicated to the legendary saint, Winifred, who lived in the 7th century, and now used as a school house, is erected over a well, from which water issues so copiously as to turn a large portion of the mill-machinery in the town. The lower part of the building is open, and the sanitary virtues of its holy water are even at the present day not wholly discredited by the inhab. The town, which was inconsiderable till the commencement of the present century, is now the largest in the co., and remarkable for its activity in mining and manufactures. Lead, zinc, copper, and coal are extensively worked in several very productive mines close to the town. These mines, and the smelting-houses, foundries, &c., in the vicinity of the town, employ from 600 to 700 hands at work varying from 10s. to 15s. per week. The chief metallic products are copper wire and copper bolts, nails, and sheathing, which are sent to Liverpool, and shipped in large quantities for the W. Indies and S. America. There are four cotton mills, established by the Holywell Cotton and Twist Company, and which employ 714 hands. A small trade is also carried on in the manufacture of galoons and doubloons: the present factory contains 60 looms, worked chiefly by women, who earn from 5s. to 13s. per week, according to the quality of the fabric on which they are engaged. Work is plentiful, and the weavers are not worse off than their fellow-labourers. A short distance from the town is the Mark, a kind of quay, on the Dee, unapproachable by ships at low water, and at all times inconvenient. Holywell was made by the Reform Act a parl. bor., contributory to Flint, which sends 1 mem. to the H. of C., and its boundaries comprise parts of the townships of Holywell and Greenfield.

HONDURAS a state of Central America. See *GUATEMALA*.

HONDURAS (BRITISH), a settlement belonging to Great Britain, on the E. coast of Central America, chiefly between lat. 16° and 18° N., and long. 86° and 90° W., having N. Yucatan, W. and S. Guatemala, and E. the Bay of Honduras. It is very extensive, but the pop. is said not to exceed 4,000, of whom only about 300 are whites. The coast is flat, and surrounded with an abundance of reefs and low verdant islands, called *keys*. The approach to the shore is very dangerous, especially during N. winds, and the different *keys* resemble each other so much as to make the navigation of the channel and anchorages extremely difficult, except to experienced pilots. Proceeding inland, the surface rises gradually from the coast into an elevated region, covered with primeval forests, interspersed with marshes. Rivers numerous, and some of them large; the principal, the Balise, is navigable for 200 m. The climate is moist, but is reported to be more healthy than that of the W. India islands, especially in the wet season. The heat during most part of the year is moderated by sea breezes; the average annual temp. is about 80° F. The rains are so heavy that the Sibun river sometimes rises 50 ft. in a few hours: they are frequently accompanied with violent thunderstorms. Volcanic products, and marble or other limestone formations, are found in various parts; the shores, banks of the rivers, &c. are covered with a deep and rich alluvial soil, capable of growing most European as well as tropical products. The forests abound with some of the finest timber trees, including mahogany, logwood, and many other valuable trees. The two now specified are the staple product of the settlement, and their cutting forms the chief occupation of the settlers. The mahogany (*Swietenia mahogany*) is one of the most majestic of trees, and is probably 200 years in arriving at maturity. It is seldom found in clusters or groups, but single, and often much dispersed; so that what is termed a *mahogany* work extends over several sq. m. There are two seasons in which the trees are cut down; one beginning shortly after Christmas, or at the end of the wet season, and the other about the middle of the year. At such periods, all is activity, the pop. being mostly employed in felling and removing the trees. The average of negroes employed in the work consist of from 10 to 20 each, at the head of whom is the *huntsman*, whose chief occupation is to search the woods, and find labour for the whole. An expert negro of this description was formerly often valued at 800*l*.

"About the beginning of August the *huntsman* is despatched on his errand. He cuts his way through the

thickest of the woods to the highest spots, and climbs the highest tree he finds, from which he minutely surveys the surrounding country. At this season, the leaves of the mahogany tree are invariably of a yellow-reddish hue; and an eye accustomed to this kind of exercise can discover, at a great distance, the places where the wood is most abundant. He now descends, and to such places his steps are now directed; and without compass or other guide than what observation has imprinted on his recollection, he never fails to reach the exact point to which he aims." The mahogany tree is commonly cut about 12 ft. from the ground. The body of the tree, from the dimensions of the wood it furnishes, is deemed the most valuable; but for purposes of an ornamental kind, the branches or limbs are generally preferred, the grain of these being much closer, and the veins more rich and variegated. Part of the wood is rough-squared on the spot; but this work is generally postponed till the logs are rafted to the entrance of the different rivers. The rafts often consist of more than 200 logs, and are floated as many miles. "When the floods are unusually rapid, it sometimes happens that the labour of a season, or perhaps of many, is at once destroyed by the breaking asunder of a raft, the whole of the mahogany being hurried precipitately to the sea." (*Honfleur*.) Mahogany at Honduras produces from 164 to 304 (Jamaica currency) per 1,000 ft.; but when of very fine quality it is worth much more. Not less, in fact, than 2,000, has been paid in London for 3 logs of mahogany, the produce of a single tree! (*Comm. Dict.*) The profits of the trade are, however, much diminished, and very precarious. Logwood cutting is much less expensive; but the price of logwood fluctuates even more than that of mahogany; varying from 71. to 144. a ton. The trees are cut in logs of about 3 ft. in length, and sent to Europe in that form. (*See Casarrea*, p. 514.) The logwood and mahogany do not grow adjacent to each other: the former inhabits a swampy soil, while the latter flourishes most in high and exposed situations. Every settlement at Honduras has its plantain walk, and many of these comprise an extent of at least 100 acres. Casava, yams, arrow root, maize, &c. are grown, but only for home consumption; the sugar-cane, coffee, and cotton succeed well, but are little cultivated; cocoa, and an inferior kind of indigo, are indigenous. European cattle, and other domestic animals, thrive greatly. The American tiger, the tapir, armadillo, racoon, grey fox, deer of various kinds, and a vast number of monkeys, inhabit the settlement. Birds and fish are in great variety, and *testacea* particularly plentiful. Many turtles are taken by the inhab. living upon the keys, or islands of the coast, a few of which find their way to London.

The following were the quantities of the principal articles exported from British Honduras in 1836:—

Mahogany - super. ft. 9,768,293	Hides - - -	No. 8,269
Logwood - - - - - 151,029	Cocoa-nuts - - -	151,029
Cochineal - - - - - serons 3,585	Cedar - - -	ft. 37,000

In the same year, 132 ships, burden 28,813 tons, chiefly from Great Britain and the U. States, entered, and 134, of 29,493 tons, left the ports of the colony.

Honduras is governed by a superintendent, nominated by the crown, and seven magistrates, elected annually by the inhab., who form a council, the members being subject to the approval of the superintendent. The latter officer has a salary of 1,500*l.*; the services of the other members of the legislature are gratuitous. Trial by jury is in force. From decisions of the central court, an appeal lies to the sovereign in council. Total public rev. (1836), 20,071*l.*; expenditure, 15,204*l.* Amount of compensation received by the proprietors of slaves at their emancipation, 101,599*l.* The average value of a slave, from 1822 to 1830, was 120*l.* 4*s.* 7*d.*, being a larger sum than in any other colony.

The only town in the settlement is Balize, at the mouth of the river of the same name, in lat. about 17° 29' N., and long. 88° 2' W. It consists of about 500 houses, chiefly of wood; the streets are regular, and the whole town is shaded by groves of cocoa-nut and tamarind trees. Its chief edifices are the government house, a church, and several chapels: it has a public school, which had 126 pupils in 1836, and several private schools.

This coast was discovered by Columbus, in 1502; the date of its first settlement by Europeans is uncertain. It was transferred from Spain to England by treaty, in 1670, but its occupation was contested at different times by the Spaniards, down to 1798, since which it has remained quietly in our possession. (*Henderson's Account of Honduras*; *Parl. Papers*, &c.)

HOÏFLEUR, a sea-port town of France, d^{ép.} Calvados, cap. cant.; on the estuary of the Seine, nearly opposite Havre, from which it is 6 m. S.E. and 30 m. N.E. Caen. Pop. (1836) 8,490. It is ill built, and *triste*; its streets being mostly narrow, crooked, dirty, and ill ventilated, and its public edifices more remarkable for

antiquity and oddity than elegance. Its port, enclosed between two jetties, is difficult of entrance, and encumbered with mud, so as to be inaccessible, except at high water, and then only for ships of small burden. It has two basins connected with it, which serve as harbours for numerous fishing boats and coasting vessels. Many of the inhab. are engaged in the herring, mackerel, and whiting fisheries, and numerous vessels sail annually from Honfleur for the cod, whale, and seal fisheries. It is more a commercial than a manufacturing town; it has, however, some building docks, rope walks, and manufactures of coppers, nails, ship biscuit, lace, &c. Its export and import trade is considerable; butter, fruit, and eggs, in large quantities are sent to England from Honfleur. A good deal of corn, and melons of very fine quality, are grown in its vicinity. Honfleur was taken from the English by Charles VII. in 1440. (*Hugo*.)

HONITON, a parl. bor., market town, and par. of England, co. Devon, hund. Axminster, near the Otter, 142 m. W. by S. London, and 16 m. E.N.E. Exeter. Area of par. and parl. bor., which are co-extensive, 2,880 acres. Pop. (1831) 3,409. The town, which stands in an extensive vale celebrated for fertility and beauty, consists chiefly of a single well paved and lighted street, nearly a mile long, lined with neat and respectable houses, built in the middle of the last century, after a destructive fire which laid nearly the whole place in ruins. The inhab. are supplied with water from a brook that runs along the whole length of the street. The church, a quarter of a mile distant, is a small but neat structure, enlarged in 1492, and remarkable for a curiously carved screen separating the nave and chancel. All-hallows chapel, built of flint in 1765, is a compact building with a square embattled tower. There are 3 chapels for dissenters, a free grammar-school, scantily endowed, a boys' national school, and a girls' working school, and an hospital.

The industry of Honiton consists of serge-weaving and lace-making; but both branches are on the decline. Some years ago, more serge was woven here than in any other town of Devon, and at the beginning of the present century the lace manufacture had arrived at that perfection, was so tasteful in the design, and so delicate and beautiful in the workmanship, as not to be excelled even by the best specimens of Brussels lace. (*Commercial Dictionary*, p. 743. *Parl. Papers*.) During the late war, veils of Honiton lace were sold in London at from 20 to 100 guineas, whereas they may now be obtained for 8 or 10 guineas. The competition of the bobbin-lace machinery, which became active in 1820, has of late years greatly impaired the trade of Honiton, though not to the extent that it has impaired the lace trade of Bedfordshire and Buckinghamshire. Shoemaking and coarse pottery employ several hands, and there is a large trade in butter, the chief portion of which is sent to the London market. Markets on Tuesday, Thursday, and Saturday; the largest on the latter day; an annual fair, the first Wednesday after July 19th, for cattle, &c.

Honiton was granted by Henry I. to Richard de Rivers, from whom it descended to the Courtenays, earls of Devon, who for many years have been the patrons and lords of the manor. It is a bor. by prescription. A portreeve and bailiff are annually elected at the manor court; the civil jurisdiction, however, is vested in the county magistrates. This bor. first sent mems. to the H. of C. in the 28th of Edward I.; but it was only twice represented prior to the reign of Charles I., since which time it has continued to send 2 mems. Previously to the passing of the Reform Act, the franchise was vested in the inhabitant householder. The Boundary Act extended the limits of the parl. bor., so as to make it include the whole par. of Honiton. Registered electors in 1838-39, 455. (*Poole's Devon*; *Comm. Dict.*; *Parl. Papers*.)

HOOGHLY, a town of the Deccan, Hindostan, prov. Bejapoor, presid. Bombay, 13 m. S. Darwar; lat. 15° 30' N., long. 75° 18' E. Pop. estimated in 1820 at 18,000. It has long been a place of great trade, its merchants and bankers frequently transacting business at Bunge, Hyderabad, Seringapatam, &c. It has no forts, but neither is very strong, and there are no public buildings worthy of notice. It was taken by Sevajee in 1673, and by a son of Aurungzebe in 1685.

HOOGHLY, a distr. of Hindostan, presid. and rov. Bengal, between lat. 22° 15' and 23° 10' N., and long. 87° 30' and 88° 45' E.; having N. the districts Burdwar and the Jungle Mehals, E. Nuddea, Calcutta, and the 24 Pergunnahs, W. Midnapore, and S. the Bay of Bengal. Area, 2,260 sq. m. Pop. (1822), 1,399,160. It is a low, level tract of great fertility, but much of it is waste, and the sea-coast, which is very unhealthy, is densely covered with jungle. Besides the Hooghly river, a great many other branches and tributaries of the Ganges intersect it; it has therefore an extensive inland navigation. On the banks of the rivers, near the sea, a good deal of salt of excellent quality is made. Land revenue in 1829-30, 1,102,874 rup. About 3-4ths

of the pop. are Hindoos, and 1-4th Mohammedans. Education is more extended in this than in most districts in Bengal; but suttees and gang robberies have notwithstanding been in general more prevalent than in most other parts of India.

HOOGHLY, a considerable town of Hindostan, presid. and prov. Bengal, cap. of above distr., on the river of the same name, 23 m. N. by W. Calcutta. "It occupies an elevated and commanding site, and is picturesque in its broken and irregular disposition; the buildings being in one place clustered together in thick groups, in other places wide and straggling, and divided by trees and patches of bamboo. A handsome Christian church rises with bold and imposing effect, conspicuous above the temples of the Hindoos and the ghats upon the bank, to the style and architecture of which it forms a striking contrast." (*Bacon*, i. 241.) The town was once of much greater importance, having been, under the Moguls, the station for collecting the custom and river duties; it is still large, prosperous, well inhabited, and a government civil station. It has a *madressa* or college, in which English, Persian, and Arabic, are taught, which, in 1854, was in a very flourishing state, having 83 students, and a revenue of nearly 16,000 rupees a year. The Dutch established a factory here in 1625, and the English founded another in 1640; the Portuguese and Danes also had settlements at Hooghly. It was at Hooghly that the first serious quarrel occurred between the Moguls and Europeans, in 1632, when a large Portuguese fleet was destroyed by the Mohammedans; it was here also that the first engagement took place between the British and the Moguls, in 1696; on which occasion the English fleet cannonaded the town, and burned 600 houses.

HOOGHLY RIVER. (See Ganges.)

HOORN, a sea-port town of N. Holland, cap. distr., on the Zuider-Zee, 20 m. N. E. of Amsterdam. Pop. about 10,000. It is surrounded with old ramparts, is tolerably well built, and has 10 churches, and various other public buildings. Its port is the best along the coast on which it is situated, and large quantities of butter and cheese, cattle, herrings, and other kinds of provisions are exported from it. Hoorn has manufactures of woollen cloths and carpets, and ship building is carried on in it to a considerable extent. It was the birthplace both of the navigator Schouten, who in 1616 discovered Cape Horn, and of Tasman, the discoverer of Van Diemen's Land and New Zealand. (*De Cloet*; *Diet. Géog.*; *Murray's Handbook*.)

HORNCASTLE, a market town and par. of England, co. Lincoln, s.oke same name, parts of Lindsey, on the navigable river Bain, 18 m. E. Lincoln, and 116 m. N. London. Area of par., 2,510 acres; pop., in 1831, 3,988. The town, which stands in a valley, and is almost surrounded by streams connected with the Witham navigation, comprises a well-built principal street, crossed by others of inferior character, and has a church, three places of worship for dissenters, a grammar-school, founded in 1571, a charity school, a large dispensary, and a union workhouse. Tanning is extensively carried on, and the Horncastle navigation gives rise to a considerable traffic with the surrounding districts. Petty sessions are held here, and it is one of the polling places for the N. division of the co. Horncastle is the chief town of a poor-law union comprising 68 parishes; and the maintenance of the poor within this par. cost 1,350*l.* in 1839. Markets on Saturday: large horse-fairs, June 22, Aug. 21, and Oct. 20.

HORNSEY, a par. and village of England, co. Middlesex, hund. Osallstone, 5 m. N. London. The par., which comprises the hamlets of Muswell-hill, Crutchfield, and the chief part of Highgate, and a part of Finchley, had, in 1831, a pop. of 4,866. This retired village is long and straggling, containing many handsome and picturesque residences, inhabited by wealthy bankers and merchants; and the New River, which meanders through it, adds greatly to the beauty of the scenery. The church, a building of the 16th century, and recently restored, comprises a nave, spire, and chancel, with a handsome "ivy-mantled" tower at the W. end. The living is a rectory, in the gift of the bishop of London, and several bequests have been made at different times for the relief of the church poor. A good charity school is attached to the church. Dissenters have 3 places of worship within the village. At a short distance is a copice called Horsey Wood, at the S. end of which is a good house of entertainment.

HORSHAM, a town, parl. bor., and par. of England, co. Sussex, rape Bramber, hund. E. Eaarwith, on the Adur, a tributary of the Arun, in the centre of a fertile and richly-wooded tract, 19½ m. N.W. Brighton, and 31½ m. S.W. London. Area of par., 8,600 acres. Pop. of do., in 1831, 5,105, since which period it has greatly increased. "The town consists of two streets, crossing each other at right angles, with an open space on the S., in which stands the court-house, and a green on the S. The mixture of trees among the houses gives it a more

syllan aspect than most other country towns have. The houses are generally timber-built, but new faced with brick; and in the street leading to the church rows of trees afford to the dwellings an agreeable shade. The town is well paved with stone, obtained from the excellent quarries in the neighbourhood, and is as well supplied with water." (*Horfield's Hist.*, &c.) Considerable improvements have taken place in Horsham within the last few years, many excellent private houses have been built, and the town is now well lighted with gas, and watched. There are numerous good inns and hotels. Several handsome public edifices are in progress of erection, including a chapel of ease, in the Gothic style, a vicarage, school-house, &c. The par. church, at the S. extremity of the town, is a spacious and venerable structure, of early English architecture, with a tower surmounted by a lofty spire: it contains some interesting monuments. The town-hall and court-house, a castellated building, with a stone front, was enlarged and improved by the Duke of Norfolk, in 1806, but since that period has been greatly neglected. The county gaol, near the S. extremity of the town, is a handsome structure, built partly with brick and partly with stone from the neighbourhood, comprising 66 wards, besides day-rooms, &c., and has accommodation for about 180 prisoners. It is under the jurisdiction of the high sheriff of the co., who appoints the governor: at present it is almost solely appropriated to debtors. During the year ending Sept. 1839, the commitments to it were 64, the expenditure for the year being 619*l.* (*Gaul Returns*, 1839.) Adjacent to the gaol were formerly some barracks, and a magazine, but these have been long removed. Horsham has chapels belonging to the General and Particular Baptists, Independents, Wesleyans, Friends, and Rom. Catholics; and many charitable endowments for the poor, the chief of which is Collier's school, founded in 1532, for 60 scholars, with a master, at a salary of 10*l.* a year. This establishment is now in a very flourishing state: the present rental of the endowment is upwards of 400*l.* per annum, the master's salary being 120*l.*, and the usher's 80*l.* The rudiments of education, and English and Latin grammar, are taught. There are also a Lancastrian and some other free schools, an infant school, and several superior private seminaries. Horsham was, till lately, the seat of the spring assizes for the co., and the midsummer quarter sessions for the W. div. of Sussex are still held in it. Until the passing of the Mun. Corp. Act the town was governed by a steward and two bailiffs, chosen annually at the court-leet of the lord of the manor. Horsham is a bor. by prescription, and sent 2 mems. to the H. of C. from the time of Edward I. till the passing of the Reform Act, which deprived it of one mem. Previously to that act the right of voting was vested in the holders of burgage tenures, but it was, in fact, a mere nomination bor. at the disposal of the Duke of Norfolk. The limits of the parl. bor. are now made identical with those of the par. Registered electors, in 1839-39, 368. Horsham is a polling-place for the W. div. of the co. The town has neither manufactures nor wholesale trade of any consequence, the inhab. deriving their chief support from the retail of goods to the surrounding district. There are two tolerably large weekly markets; one on Saturday for corn, and on Monday for poultry, a good many of which are reared for the London market. The living is a vicarage; patron, the archbishop of Canterbury. (*Horfield's Hist.*, *Antiq.*, and *Topog. of Sussex*, 835, vol. ii.; *Parl. Reports*; *Private Inform.*)

HOUSLOW, a market town of England, situated partly in Heston and partly in Isleworth par., co. Middlesex, hund. Isleworth, 11 m. W. S.W. London. The pop. is included in the returns for the above parishes. The town stands on the W. edge of an extensive heath, bearing the same name, but now to a great extent enclosed; it consists of a single street, in which are numerous inns and posting-houses, once busy and prosperous, but comparatively deserted since the opening of the Great Western Railway. The chapel of ease is a modern erection at the W. end of the town, built on the site of an old priory; and connected with it is a charity school attended by 200 children of both sexes. There are 3 places of worship for dissenters. On the S. side of the co. a low brick barracks, erected in 1758, for the accommodation of 600 men; and in another part of the heath are two extensive powder-mills. Market-day, Thursday.

HOWDEN, a market-town and par. of England, a dependency of the co. of Durham, but situated in the E. rid. co. York, wap. and lib. same name, 17 m. S.S.E. York, 165 m. N. London. The entire par., which contains 14 townships, has an area of 14,510 acres, and had a pop. of 4,331, in 1831: the township of Howden contains 2,593 acres, and had, in 1831, 2,130 inhab. The township of the co. a low but richly cultivated plain, about 3 miles N. of the Ouse, where there is a small harbour for boats, and a ferry. Streets narrow, badly paved, and only partially lighted: houses mean, and the supply

of water insufficient. The church, formerly collegiate, is a spacious cruciform structure, in the decorated English style, with an elegant square embattled tower, 235 ft. high, rising from the centre upon pointed arches, supported by clustered pillars. The chapter-house, built in the middle of the 14th century, is of octagonal shape, resembling the chapter-house at York, but of much less extent. The delicacy, richness, and symmetry of its architecture are equalled by few specimens of the kind in the country, except Melrose Abbey, in Scotland. (*Hutchinson's Hist. of Durham*, iii. 466.) On the S. side of the church are the remains of an ancient palace, formerly used as a summer residence by the bishops of Durham, especially the celebrated Hugh de Pudsey, who died here in 1195. The ruins consist of a centre, front, and W. wing, with some detached parts, used as granaries. The site of this palace is held on lease from the see of Durham, and the venerable ruins, patched up with modern building, are now converted into a farm-house. Besides the church there are three places of worship for dissenters.

A grammar-school has for many years been kept in a building contiguous to the church by the successive curates of Howden; but it has never been endowed, and furnishes no gratuitous education, except to 12 children, whose instruction in English is provided for by an income of 24l. yearly, arising from a bequest made in 1603. (*Charity Comm. Rep.* part ii. 763.) The national school is supported by subscription, and gives instruction to 300 children of both sexes. Numerous other charities and benefactions exist for the relief of the poor of the par. and township. Market on Saturday. A great horse fair, the largest in the E. riding, is held here on Sept. 25. and six following days: besides this, there are fairs on every alternate Tuesday for horses and cattle. Howden is one of the polling-places appointed in the Reform Act for the election of members for the E. riding.

HUDDERSFIELD, an important manufacturing town, parl. bor., and par. of England, W. Riding co. York, wap. Agbrigg, on the Colne, a tributary of the Calder, 162 m. N. by W. London, and 15 m. S.W. Leeds. The par., which lies chiefly in this river valley, extends nearly 12 m. N. of the town, and includes 7 townships, with an area of 15,080 acres, and a pop., in 1831, of 31,041, being an increase of 109 per cent. since the census of 1801, when the pop. was 14,848. At present (1840) the pop. of the par. is supposed to be about 40,000. The township of Huddersfield, which is co-extensive with the par. bor., extends over 3,350 acres; and had, in 1831, a pop. of 19,085, which, when compared with that of 1801 (7,368), exhibits an increase of 163 per cent. in thirty years. The present town has little appearance of antiquity, and appears to be wholly the result of manufacturing industry. It is situated on the slope and summit of an eminence rising from the Colne, and is surrounded by other hills of greater height: the streets are regular, well paved, and lighted with gas; and the best houses, which are numerous, built of a light-coloured stone. The market-place is spacious, and surrounded by handsome buildings. The town is well supplied with water from reservoirs about 4 m. W. in the township of Golear. The chief ornaments of Huddersfield are its churches, cloth-hall, and other public buildings. The par. church, built in the reign of Henry VIII., was taken down in 1834, and rebuilt by public subscription, at the cost of 8,852l., including 500l. expended on a very handsome painted east window: this is at once an elegant and a commodious structure, and does credit alike to the taste and liberality of the town's people. The vicarage is in the gift of the Ramsden family; the average income about 400l. a year. There are 7 churches in the par., of which the vicar has the patronage. Trinity Church, built and endowed at private expense, and opened in 1819, is in the pointed Gothic style, and has an embattled tower at the W. end; it holds conveniently 1,600. Its situation, on an eminence N.W. of the town, renders it a striking object from any point overlooking Huddersfield. St. Paul's Church, erected in 1831, and fitted to accommodate 1,280 persons, is a good modern imitation of the early English style: it may be distinguished by its tower surmounted by a light spire. This, and another church at the Paddock, have been built by funds provided by the parl. commissioners. There are 7 places of worship for dissenters, the most ornamental of which belongs to the Rom. Cath. The most capacious, however, is one of two belonging to the Wesleyan Methodists: it is the largest ever built by that sect, and will hold 2,400 persons. Sunday-schools are attached to all the churches and chapels. Among the secular buildings the chief is the cloth-hall, erected in 1786 by Sir John Ramsden, and enlarged by his son in 1780. It is a circular edifice two stories high, bisected, as respects its lower story, by an arcade, on one side of which are separate compartments or warehouses, let out to the larger manufacturers; on the other, an open space

filled up by stalls held by the country weavers, and subdivided by passages between the rows of stalls. The attendance on a market-day (Tuesday) averages 600 traders,

and the rules of the market make all the business be completed half an hour after noon. The removal of goods is allowed after 3 p. m. The light of the building is wholly admitted from within, a contrivance intended to secure it the better both from fire and depredation. Among the other public buildings may be mentioned the Philosophical Hall, a Grecian structure very lately erected by a thriving mechanics' institute founded in 1825: it is well adapted for lectures, and other useful purposes to which it is devoted. The Huddersfield and Agbrigg infirmary is an elegant stone edifice with wings, having a portico supported by four fluted Doric columns. A dispensary assists the infirmary in giving medical relief to the poor of the town. About ½ m. from the town, on the Sheffield road, is a sulphureous spa, over which have been built spacious and beautiful rooms fitted up with every convenience for bathers. The educational and religious institutions of Huddersfield are as follow:—a church-collegiate school, intended to supply the want of a regular grammar-school; a college furnishing a good general education, open to all sects; a national and infant school, instructing together about 800 children; and a British and foreign school: but it is the general opinion that the medical education is still deficient. The Bible Society and Missionary Associations hold the highest stations amongst the purely religious establishments of the town.

Huddersfield is one of the principal seats of the woollen manufacture. It owes its importance in this respect partly to nature and partly to art. It stands in the midst of a rich coal-field, and there is an ample supply of water or mills from the neighbouring rivers. The means of cheap and convenient transit for its products, and the raw materials of its industry, have also been provided.

Sir J. Ramsden, on whose estate the town is built, obtained, in 1774, an act for making a canal to connect this town with the Calder. It commences at King's mill, close to Huddersfield, and running N. E. for 3½ m., joins the Calder navigator at Cooper's bridge, from which point there is a communication with the Humber estuary. The connection with the town and ports of Lancashire is effected by means of the Huddersfield canal, completed in 1806: it takes a S.W. direction past Slaithwaite to Marsden, where, at a summit level of 656 ft. above the sea, is the highest canal level in England; it enters a tunnel 5,450 yards long, cut through Standedge hills, and thence runs down the vale of Diggle in Saddleworth, and past Stayley bridge to its junction with the Ashton and Oldham canal. Its entire length is 194 m., and it cost 300,000l. (*Priestley's Canals*, pp. 371. 667.)

This facility of intercourse will be vastly increased, when, by the completion of the Leeds and Manchester railway, a rapid communication shall have been established between the ports of Hull, Liverpool, and the intermediate towns. "Huddersfield carries on a very flourishing trade both in cotton and woollen goods, particularly the latter: every factory seems to have full employment, and every thing about the town bears the appearance of opulence." (*Bound. Rep.*) The following table gives an account of the number of mills and people employed in them in 1839: (*Factory Returns*, p. 378.)

Description.	No.	Water Wheels.	Steam Engines.	Power.	Hands employed.
Woollen mills	100	20	31	Horse, 846	2,881
Cotton	5	2	1	41	263
Silk	5	3	2	96	294
Total	106	25	34	985	3,438

Besides the factory work people there are many others employed in hand-loom weaving, warping, winding, &c. and in making mill machinery. The entire working pop. is estimated at above 7,000. The goods manufactured in this par. are narrow and broad cloths of superfine and inferior qualities, kerseymeres, flushings, and corded cloths of all descriptions. Cloths of wool and cotton mixed, especially fancy articles, are an increasing object of manufacture, and large quantities are now sent to the foreign markets. Valuable articles, as satins, coats, of stuff and silk, are also much made, and highly prized for superior texture and elegance of pattern. In the last few years shawl-making and merino-weaving from British wool have been introduced with advantage.

The Reform Act conferred on Huddersfield, for the first time, the privilege of sending 1 mem. to the H. of C. Registered voters, in 1839-40, 626. Petty sessions are held here every week; and there are two courts, for the recovery of debts under 10l., one for the honor of Pontefract, and the other by a recent local act for the parish, along with certain adjoining parishes. The cloth-market is held on Tuesday, which is always a day of intense bustle. Fairs for cattle, &c., March 31. May 4. Oct. 1.

Huddersfield is said by Dr. Whitaker (*Hist. of Leeds*, p. 347.), to be identical with the Oderfeld of Domesday Book, and to have been at that time "a mere waste."

The parish, according to the same authority, was, like Halifax, "separated from Dewsbury, and erected into an independent parish, by the influence of one of the earlier Lacys, to whose piety and munificence this neighbourhood has been greatly indebted, as the founders of its parish churches." The manor of Huddersfield, which originally belonged to the earl of Halifax, came into the possession of the Burton family, who sold it in the 18th of Eliza. to Sir Gilbert Gerard. How soon the Ramsden family, its present possessors, acquired it, is uncertain; but one of them applied, as lord of the manor, during the reign of Charles II. for the privilege of holding a market in the small town of Huddersfield: from this time forward it has been a market-town. It is indeed indebted to the Ramsden family for many privileges, which have greatly contributed to raise it to its present importance. (*Parl. Papers; Baines's Gaz. of Yorkshire; Whitaker's Hist. of Leeds. Private Information.*)

HUDSON, a town or city and port of entry of the U. States, New York, co. Columbia, of which it is the cap., built chiefly on a rocky promontory on the Hudson River, 90 m. N. by E. New York. Pop. (1835), 5,531. It is regularly laid out; the streets are spacious, and cross each other at right angles: Warren Street, the principal, is upwards of a mile in length. Opposite the river is a handsome promenade, and on either side the promontory forming the site of the town is a spacious bay, with depth enough for vessels of any burden, and on which some quays, docks, &c. have been constructed. Here is a new and handsome court-house, comprising also a school and other offices. Hudson has several places for public worship, a Lancastrian and several superior private schools, a private lunatic asylum, a bank with a capital of 150,000 dollars, many good hotels, several printing establishments, and stores of various kinds. It is a place of considerable trade, but is a port of delivery only, dependent upon the port of New York. Twelve ships, of the aggregate burden of 4,000 tons, were owned in Hudson in 1836, 11 of which were engaged in the whale fishery. There are manufactures of cotton and woollen fabrics, with establishments for calico printing and bleaching. It was founded in 1784, and incorporated under a mayor, recorder, and aldermen, in the succeeding year. (*New York Gazetteer; American Almanack.*)

HUDSON'S BAY, a large bay or inland sea of N. America, extending between 51° and 64° N. lat., and 78° and 95° W. long., and surrounded on all sides by the partially explored British territories N. of Canada. Its length, N. to S., is about 800 m.; greatest breadth, estimated at 600 m.; area, probably near 300,000 sq. m. Its S. extremity is called James's Bay. It communicates with the Atlantic by Hudson's Straits, a sea about 500 m. in length, and generally upwards of 100 m. in breadth. Hudson's Bay is navigable for only a few months in the year, being at other times frozen over or obstructed by drift ice. It is full of sand-banks, reefs, and islands, and inhabited by few fish. Its shores are rocky and barren. On its W. coast are several settlements of the Hudson's Bay Company, which monopolises nearly all the fur trade of British N. America. This company was incorporated by a charter from Charles II., in 1669. In 1837, the numbers, the principal furs, &c. imported and exposed for sale by the company, were—beaver skins, 82,927; marten do., 156,168; fox do., about 25,000; musquash do., 838,650; lynx do., 31,887; mink do., 27,570; quantities generally much above those of the years immediately preceding. The company in the same year imported 1,269,000 goose and swan quills, 461 lbs. sea-horse teeth, besides castor, isinglass, and other articles.

HUDSON RIVER, the principal river of the state of New York, U. States, through the E. part of which it flows, generally in a direction, but near its mouth, 44° N. to its mouth in the Atlantic, below New York city, about lat. 40° 40' N. Throughout the greater part of its course (that is, from where it passes over a ledge of primitive rock, and forms what are called Glenn's Falls, in lat. about 43° 18') it runs through a very remarkable depression or valley. This valley extends from the Atlantic to the St. Lawrence, having in its N. part the Lake Champlain with its outlet the Richelieu river, and, though enclosed by lofty mountain ranges on either side, the highest level of its surface is only 147 ft. above the level of the tide in the Hudson. The total length of Hudson River is about 280 m., 150 of which, or up to 5 m. beyond the town of Hudson, are navigable for the largest ships. Sloops pass as far up as Troy, 180 m. from the sea, to which distance the influence of the tide is felt, and thence through a lock to Waterford, a few miles further. Near the head of the tide the mean breadth of the Hudson does not reach a mile; but in the lower part of its course it is much wider, and below New York it expands into a spacious basin 4 m. broad, which forms the harbour of that city. Its only tributary worthy of notice is the Mohawk, which joins it from the W. Owing to its small rate of descent, the current of the Hudson below tide is slow; and, except in the season of floods, it appears rather like an inland bay. At Albany, about the

middle of its course, during the 19 years from 1818 to 1836 inclusive, its navigation was at an average closed by frost for about 90 days annually.

The banks of this river are almost everywhere abrupt and lofty. The chief towns on it are New York, Albany, Newbury, Hudson, and Catskill. It is connected with the basin of the St. Lawrence by the Champlain and the Erie canals. (*Gordon's New York Gazetteer*, pp. 24—26; *Darby's View of the U. States*, pp. 134—141; *American Almanack*, 1838.)

HUE*, or HUÉ-FO, the cap. city of the empire of Anam, on the river of same name, about 10 m. from the Chinese Sea: lat. 16° 19' N., long. 107° 12' E. Pop. uncertain. This remarkable city, which has probably no parallel in the East, was fortified early in the present century, in the European style, and it is said, upon the model of Strasbourg. The work was undertaken by the king of Cochinchina, and was carried on under the instructions of some French officers previously in his service. "The new city is completely insulated, having the river on two sides of it, and a spacious canal of from 30 to 40 yards broad on the other two. The circumference of the walls is upwards of 5 m. The form of the fortification is nearly an equilateral quadrangle, each face measuring 1,180 toises. The fortress has a regular and beautiful glacis, extending from the river or canal to the ditch, a covert way all round, and a ditch which is 30 yards broad, with from 4 to 5 feet water in it all through. The rampart is built of hard earth, cased on the outside with bricks. Each angle is flanked by 4 bastions, intended to mount 36 guns apiece. To each face there are also 4 arched gateways of solid masonry, to which the approach across the ditch is by handsome arched stone bridges. The area inside is laid out into regular and spacious streets, at right angles to each other. A handsome and broad canal forms a communication between the river and the fortress, and within is distributed by various branches, so as to communicate with the palace, arsenal, granaries, and other public edifices. By this channel the taxes and tributes are brought from the provinces, and conducted at once to the very doors of the palace or magazines. In the whole of this extensive fortification, there is scarcely any thing slovenly, barbarous, or incomplete in design. The banks of the river and canal, forming the base of the glacis, are not only regularly sloped down every where, but wherever the work is completed, they are cased from the foundation with a face of solid masonry. The canal within the walls is executed in the same perfect manner; and the bridges which are thrown over it have not only neat stone balustrades, but are paved all over with marble brought from Siquin." (*Crawford's Embassy to Siam*, &c., pp. 384—386.) The palace is situated within a strong inner citadel, consisting of two distinct walls or ramparts. The barracks surround the whole of the outer part of the citadel, and in 1821 would have done no discredit to the best military estab. in Europe. From 12,000 to 13,000 troops were then constantly stationed in the cap. The arsenal contains a vast number of cannon, shot, shells, &c., all manufactured in the country. The public granaries are also of enormous extent, and kept full of corn. The fortress of Hué, from its immense size, which is its greatest fault, would require at least 50,000 troops to garrison it, in case of an attack from Europeans: against Asiatic enemies it is impregnable. There are some building-docks on the river, and a large fleet of galleys is usually stationed at Hué. The river is not above 400 yards wide at its entrance, but within is little inferior in breadth to the rivers of Saigon, or Bangkok: owing to a bar at its mouth, however, it is fitted only for ships of small draught. Its entrance is completely commanded by a stone quadrangular fort, built in the European style. Its banks are very raised, and in some places rise with picturesque. The neighbourhood of the cap. is every where in a high state of cultivation, with rice, mulberry trees, cotton, fruit, &c., and thickly interspersed with villages. Mr. Crawford remarks, that Hué is probably the only city in India, in the vicinity of which there are good roads, bridges, and canals. About 10 leagues N. is the royal mausoleum, surrounded by magnificent grounds, laid out by a late king of Cochinchina. (*Crawford's Embassy*, l. 368—400; *White's Voyage*, &c.; *Finlayson; Ritter, Asia Ertrunken*, iii. 1006—1012.)

HUESCA (an. Oaca), a town of Spain, prov. Aragon, cap. partido same name, and a bishop's see, 35 m. N.E. Saragossa, and 125 m. W. by N. Barcelona. Pop., according to Mifano, 9,200. It stands on a slope close to the Isuela, a tributary of the Cinca, is surrounded by walls now falling into decay, and contains many respectable houses. The chief public buildings are a cathedral, 4 par. churches, 16 convents, a founding hospital, cavalry barracks, 3 schools, and a university; the latter, entitled *Scotica*, comprising 4 colleges, was founded, in 1354, by Peter IV. of Aragon, and further enlarged by subsequent monarchs; but the endowments as in most Spanish universities, is wretchedly small, and the education is of a very inferior description. The industry of

the town is confined to tanning and the weaving of coarse lins; but the neighbourhood abounds in grain, wine, and other fruits, and large flocks of sheep graze on the surrounding hills. An annual fair is held here, and much frequented. The town was originally founded by Quintus Sertorius, anno 77 B.C., and was known in the time of Augustus as *urbs victricis Osea*. It subsequently fell into the hands of the Moors, from whom it was taken by Peter I. of Aragon, after the battle of Alcoraz, in 1095. (*Memoirs of Don Gago*.)

HULL (KINGSTON ON), a large and important commercial town, river-port, mun. and parl. bor. of England, and co. of itself, locally situated in co. York. E. riding, Harthill wap., on the N. bank of the Humber estuary, 22 m. from the Spurn-head, 34 m. S.E. York, and 155 m. N. London. Lat. 53° 45' N., long. 0° 20' W. Pop. of parl. bor., (which includes, besides the town pars., those of Sculcoates and Drypool, and a portion of the par. of Sutton,) 49,727 in 1831. The co. includes also the par. of Ella, Hessel and N. Ferryby, with a pop. of 2,959 persons, chiefly engaged in agricultural pursuits. The town, which stands close to the confluence of the navigable river Hull with the Humber, has been greatly enlarged and improved during the last half century. It is well paved and lighted with gas: the principal streets extend nearly 2 m. along the Humber, and about the same distance along the W. bank of the Hull; and from these others branch off, crossing each other in different directions, and covering an extensive area. Almost the whole town is built with brick: the older streets are inconveniently narrow; but many recently laid out are wide and regular, containing handsome residences. The public buildings are numerous, but, generally speaking, not remarkable for beauty: the principal, besides the churches, are the Mansion-house (in which is the court-house and court of requests), the guildhall, exchange, corn-exchange, custom and excise offices, the Trinity-house, the gaol (built at an expense of 22,000*l.*), the theatre, and the citadel, a regularly garrisoned fort on the E. side of the river Hull, which is here crossed by a stone drawbridge of 3 arches. A good market-house was built some years ago, and in the market-place is an equestrian statue of William III. The town has also a handsome Doric column, surmounted by a colossal statue of Wilberforce, the great advocate for the abolition of slavery. Within the parl. bor. are 8 churches, among which that of the Holy Trinity, in the market-place, begun in the 14th century, is remarkable as one of the best specimens in England of the Gothic style, at different periods. It is a cruciform, cathedral-like building, from the centre of which rises a highly ornamented embattled tower with pinnacles, 140 ft. in height. The interior is 280 ft. long, and 72 ft. broad. St. Mary's, in Lowgate, was originally built at nearly the same time as that last mentioned; but having been partly destroyed by Henry VIII., it was afterwards restored at different periods, and with little taste in the architecture. There are also 30 places of worship for Dissenters, a Jews' synagogue, and a floating chapel for the use of Dissenters; to all of these large Sunday schools are attached, which furnish instruction to upwards of 7,000 children. The principal schools are, the Grammar School, founded by Bishop Alcock, in 1486, and chartered by Queen Elizabeth, in which the instruction is general as well as classical, the Vicar's School, established in 1734 for 60 boys; Cogan's charity school, endowed with 400*l.* a year for the maintenance and instruction of 40 girls; the nautical school for 36 boys, attached to the Trinity House; 3 national schools, attended in 1834 by about 1,100 children; and 2 Lancastrian schools, with 750 children. The means of procuring a sound education have been greatly increased of late years, by the establishment of 2 colleges which furnish instruction in classics, history, natural science, &c., on a plan similar to that which is pursued at the University and King's Colleges, London. Among the numerous endowed charities of the town, the oldest is the Trinity House, founded in 1369, for the support of decayed seamen and their widows, and chartered by Henry VIII. The present building, erected in 1753, consists of 4 sides enclosing a square; the E. front is an elevation of the Tuscan order, and the interior comprises 2 large and well-proportioned council-chambers, besides offices and apartments for 32 pensioners. A school within the building gives a useful nautical education to the sons of seamen intended for the merchant-service. The Charterhouse Hospital (originally endowed in 1380 for poor monks) was re-established in 1640, and devoted to the maintenance of poor pensioners. The revenues are stated by the Charity Commissioners (*Analyst. Digest*) to average 1,500*l.* a year; and there is accommodation for 60 persons, besides a chaplain. Six other endowed hospitals or almshouses give relief to about 70 persons. The Charity-hall is a kind of poor-house, established by an act obtained in 9 and 10 William III.; it was built by subscription, and is now maintained by the poor-rates raised within the bor. The Infirmary, a brick building

ornamented with stone, was erected in 1782; it accommodates 70 in-patients, and furnishes advice and medicine to an unlimited number of out-patients: the annual expenses are defrayed by voluntary subscription. A dispensary, opened in 1814, has also been extensively useful in giving medical relief to the poor in this increasing town.

The port of Hull, which ranks fourth amongst those of the British empire, has extensive accommodations for shipping, which has been greatly enlarged during the present century. The old dock formed in 1775 occupies the place of the old wall and ramparts: it is 1,700 ft. long, 250 ft. broad, and 4 ft. deep. Its wharfs, quays, &c., occupy an area of 13 acres, and the entrance is on the E. side from the Hull about 300 yards above its mouth. In 1807, the accommodation was further increased by the construction of a dock opening directly into the Humber: its dimensions are 920 ft. in length, 350 ft. in breadth, and 30 ft. in depth, the wharfs, &c., covering an area of 9 acres. A third dock, connecting those above mentioned, was completed in 1829, at an expense of 180,000*l.*; its water-surface exceeds 6 acres, and affords accommodation for about 70 square-rigged vessels. In 1836, 563 ships, of 63,524 tons, belonged to this port, chiefly employed in trading with Germany and the Baltic, in the coasting trade, and in the whale fishery.

• The commerce of Hull, which is very large, depends principally on her advantageous situation. She is the principal emporium of the extensive and fertile countries situated on the Humber estuary, and those traversed by the numerous and important rivers that have their embouchure in it, including the Trent, Don, Ouse, &c. The natural facilities for internal communication thus enjoyed by Hull, have been greatly extended by artificial means. She is now united, partly by rivers and partly by canals, with Sheffield, Leeds, Manchester, Liverpool, &c.; so that she has become not merely the principal port for the N. Riding of Yorkshire, but also for a considerable portion of the trade carried on between Lancashire and the N. parts of the Continent. The great articles of export are cotton stuffs and twist, woollen goods, hardware and earthenware, &c. Of imports, the principal articles are wool, bones, timber, hemp and flax, corn and seeds, madder, bar, turpentine, skins, &c. The rise of Guile (which see) has somewhat injured the trade of Hull; and it may probably, also, sustain some injury from the privilege of bonding being lately granted to Gainsborough; but its superior facilities for trade and navigation will always ensure for it a decided superiority over the other ports on the Humber and its affluents. Hull used to be very largely engaged in the N. whale fishery; but that branch of business, though still carried on to a considerable extent, has materially declined. A regular intercourse is kept up between Hull and London, and Hull and different ports of the Continent, by steam vessels.

Subjoined is an account of the quantities of the principal articles of foreign produce, imported into Hull during each of the three years ending with 1839:—

Articles.	Imported in

[For an Account of the Cotton Twist exported, see top of next column.]

The gross customs' duties at the port of Hull amounted in 1838 to 758,432*l.*, and in 1839 to 894,444*l.*

The manufactures of Hull are not very important. A flax and cotton mill employed, in 1838, 389 hands; there is also a woolen mill, with extensive oil mills and sugar houses. In 1839, 4,566,485 lbs. of hard soap were made in Hull; sail-cloth and cordage are also extensively produced; and there are white lead works, ship-builders' yards, and the other works necessary to a considerable port. The Hull Joint Stock Banking Co., established in 1833, has its principal office here; and here also is a branch of the Bank of England. A savings' bank, established in 1818, has been very extensively useful. There are four newspapers. The mun. cor., which received its first charter in the 27th of Edward I., was enlarged by the Municipal Reform Act, so as to be co-extensive with the parishes, and was divided into seven wards; the government being vested in 14 aldermen (one of whom is

mayor), and 42 councillors. Quarter and petty sessions are held under a recorder, and there is a court for the recovery of debts under 40*l.* Hull has sent 2 mems. to the H. of C. since the 33d of Edward I., and the franchise, previously to the passing of the Reform Act, was vested in freemen, by birth, 'certitude, purchase, or gift (about 1,000 previous to 1832). The limits of the present par. bor. include (besides the old bor.) the entire par. of Sculcoates and Drypool, a small portion of the par. of Sutton, and the extra-parochial district called Garrison-side. Reg. electors, in 1838-39, 4,222. Markets on Tuesdays and Saturdays: fairs for horses, July 10., Oct. 10., and Dec. 10. The name of Kingston-on-Hull was given to it by Edward I., who, seeing its eligibility for becoming an important station, erected a fortress, and constituted it a chartered town and port. When Edward III. invaded France, in 1359, Hull contributed 16 ships and 470 mariners. The fortifications, commenced early in the 14th century, were completed by Sir Michael de la Pole, a great benefactor to this town during the reign of Richard II. The plague made great ravages here during the 15th, 16th, and 17th centuries.

mayor), and 42 councillors. Quarter and petty sessions are held under a recorder, and there is a court for the recovery of debts under 40*l.* Hull has sent 2 mems. to the H. of C. since the 33d of Edward I., and the franchise, previously to the passing of the Reform Act, was vested in freemen, by birth, 'certitude, purchase, or gift (about 1,000 previous to 1832). The limits of the present par. bor. include (besides the old bor.) the entire par. of Sculcoates and Drypool, a small portion of the par. of Sutton, and the extra-parochial district called Garrison-side. Reg. electors, in 1838-39, 4,222. Markets on Tuesdays and Saturdays: fairs for horses, July 10., Oct. 10., and Dec. 10. The name of Kingston-on-Hull was given to it by Edward I., who, seeing its eligibility for becoming an important station, erected a fortress, and constituted it a chartered town and port. When Edward III. invaded France, in 1359, Hull contributed 16 ships and 470 mariners. The fortifications, commenced early in the 14th century, were completed by Sir Michael de la Pole, a great benefactor to this town during the reign of Richard II. The plague made great ravages here during the 15th, 16th, and 17th centuries.

In the reign of Charles I., Hull was the first to close its gates against the king, who shortly after besieged it, and would have taken it by stratagem, if the treachery of Sir John Hotham, its governor, had not been discovered in time to prevent its surrender to the royalists. The town was afterwards besieged by the Marquis of Newcastle, and successfully defended by Lord Fairfax. The fortifications were greatly improved by Charles II., and the citadel was occupied by a large body of troops in order to keep in awe the inhabs. who were considered to be disaffected to the Stuart dynasty. At the close of the reign of James II., the town, fort, and garrison being in the hands of the Jacobite party, the place was surprised, and the Prince of Orange proclaimed king; the anniversary of which event is still kept as a holiday. (Forster's Sketches on Hull; Offic. Doc.; Priv. Inform.)

HUMBER, a great river, or rather estuary, on the E. side of England, between Yorkshire and Lincolnshire. It extends from Goole E. to Hull; and thence S.E. to its embouchure between the Spurn Point on the N., and the opposite coast of Lincoln on the S. This estuary receives the waters of some of the most important of the English rivers. At its W. extremity it is joined by the Ouse (after the latter has been augmented by the Derwent, the Aire, &c.), and by the Don; and a little lower down it is joined by the Trent, and still lower down by the Hull river. Hull is the principal port of the Humbers, and next to it are Goole and Great Grimsby. A Hull spring tide rises about 25, and neaps about 12 ft.; and as there is at all times a considerable depth of water in the fair-way of the channel, Hull is accessible by very large vessels. Goole, which is about 23 m. more inland, may be reached by vessels drawing 15 and 17 ft. water, provided they take advantage of the tide. The basin of the Humber, or the country drained by the Ouse, Trent, and other rivers falling into this great estuary, embraces an extent of about 10,000 sq. in., comprising some of the most populous and fertile districts in the kingdom.

CATALOGUE.

ADAIR (SIR ROBERT).—AN HISTORICAL MEMOIR OF A MISSION TO THE COURT OF VIENNA in 1806. By the Right Honourable Sir ROBERT ADAIR, G.C.B. With a Selection from his Despatches, published by permission of the proper Authorities. 8vo. 18s. cloth.

"Sir Robert Adair's valuable Memoir needs no commendation. Its obvious utility, the nature of its contents, and the name of the author, will command the notice and appreciation of statesmen and historians."—*ATHENÆUM*.

"The vindication of Mr. Fox from the observations of Mr. Gentz and others is complete, and the Memoir is altogether a work which must be deferred to by future historians as the authority on the important affairs of which it treats."—*FAIR'S MAGAZINE*.

ADDISON.—THE KNIGHTS TEMPLARS.

By C. G. ADDISON, Esq., of the Inner Temple. 2d Edition, enlarged, square crown 8vo. with Illustrations, 18s. cloth.

ADDISON.—THE TEMPLE CHURCH IN LONDON:

Its History and Antiquities. By C. G. ADDISON, Esq., of the Inner Temple; Author of "The History of the Knights Templars." Square crown 8vo. with Six Plates, 5s. cloth.

Also,

A FULL AND COMPLETE GUIDE, HISTORICAL AND DESCRIPTIVE, TO THE TEMPLE CHURCH. (From Mr. Addison's "History of the Temple Church.") Square cr. 8vo. 1s. sewed.

AIKIN.—THE LIFE OF JOSEPH ADDISON.

Illustrated by many of his Letters and Private Papers never before published. By LUCY AIKIN. 2 vols. post 8vo. with Portrait from Sir Godfrey Kneller's Picture, 18s. cloth.

"In the execution of her labour, Miss Aikin has exercised praiseworthy diligence; she has ransacked among those fine and inexhaustible sources of personal and national interest—family papers, and has succeeded in rescuing from the obscurity of worm-eaten chests, and from the bondage of red tape, many documents which throw light on the most doubtful parts of Addison's history, and relieve his character from the reproaches attempted to be cast on it. She has produced, both in style and matter, a very interesting work, creditable to her feelings and talents, and honourable to her industry."—*BRITANNIA*.

ALLAN.—A PICTORIAL TOUR IN THE MEDITERRANEAN;

Comprising Malta, Dalmatia, Turkey, Asia Minor, Grecian Archipelago, Egypt, Nubia, Greece, Ionian Islands, Sicily, Italy, and Spain. By J. H. ALLAN, Member of the Athenian Archaeological Society, and of the Egyptian Society of Cairo. Imperial 4to. with upwards of Forty Lithographed Drawings, and 70 Wood Engravings, £3. 3s. cloth.

"A most artist-like and interesting work, full of beautiful views, and interspersed with many charming woodcuts of scenery and antiquities."—*LITERARY GAZETTE*.

AMY HERBERT.

By a LADY. Edited by the Rev. WILLIAM SEWELL, B.D. of Exeter College, Oxford. 2 vols. fcp. 8vo. 9s. cloth.

"Amy Herbert paints nature to the life. It is by 'a Lady,' for whose soundness Mr. Sewell is sponsor. It is admirably adapted for the young of the higher classes, and we sincerely hope it may not be the fair author's last production."—*CHRISTIAN REMEMBRANCE*.

BAILEY.—ESSAYS ON THE PURSUIT OF TRUTH,

And on the Progress of Knowledge. By SAMUEL BAILEY, Author of "Essays on the Formation and Publication of Opinions," "Berkeley's Theory of Vision," &c. 2d Edition, revised and enlarged, 8vo. 9s. 6d. cloth.

"Mr. Bailey is an admirable writer, both as to the general tone of thought and sentiment, and as to his style, which is clear, forcible, and elegant. On the class of subjects to which he has chiefly directed his attention, no man writes what is more worthy of being read, or what is acceptable to a larger class of readers. The peculiar quality of his powerful essays is the practical and useful conviction they produce of truths as obvious as they are important, but which are strangely neglected by the majority of mankind. We do not often meet with a book which we can more strongly recommend."—*INQUIRER*.

BAILLIE'S (JOANNA) NEW DRAMAS.

3 vols. 8vo. £1. 16s. boards.

BAILLIE'S (JOANNA) PLAYS ON THE PASSIONS.

3 vols. 8vo. £1. 11s. 6d. boards.

BAKEWELL.—AN INTRODUCTION TO GEOLOGY.

Intended to convey Practical Knowledge of the Science, and comprising the most important recent discoveries; with explanations of the facts and phenomena which serve to confirm or invalidate various Geological Theories. By ROBERT BAKEWELL. Fifth Edition, considerably enlarged, 8vo. with numerous Plates and Woodcuts, 21s. cloth.

BALMAIN.—LESSONS ON CHEMISTRY,

For the use of Pupils in Schools, Junior Students in Universities, and Readers who wish to learn the fundamental Principles and leading Facts: with Questions for Examination, Glossaries of Chemical Terms and Chemical Symbols, and an Index. By WILLIAM H. BALMAIN. With numerous Woodcuts, illustrative of the Decompositions, fcp. 8vo. 6s. cloth.

BAYLDON.—ART OF VALUING RENTS AND TILLAGES,

And the Tenant's Right of Entering and Quitting Farms, explained by several Specimens of Valuations; and Remarks on the Cultivation pursued on Soils in different Situations. Adapted to the Use of Landlords, Land-Agents, Appraisers, Farmers, and Tenants. By J. S. BAYLDON. 6th Edition, corrected and revised. By JOHN DONALDSON, Land-Steward, Author of "A Treatise on Manures and Grasses." 8vo. 10s. 6d. cloth.

BAYLDON.—TREATISE ON THE VALUATION OF PROPERTY

FOR THE POOR'S RATE; shewing the Method of Rating Lands, Buildings, Tithes, Mines, Woods, Navigable Rivers and Canals, and Personal Property: with an Abstract of the Poor Laws relating to Rates and Appeals. By J. S. BAYLDON, Author of "Rents and Tillages." 1 vol. 8vo. 7s. 6d. boards.

BEALE (ANNE).—THE VALE OF THE TOWEY;

Or, Sketches in South Wales. By ANNE BEALE. Post 8vo. 10s. 6d. cloth.

"Miss Beale has been sojourning in the Vale of the Towy; and has thrown her enjoyment of its scenery, and her observations on the manners of its rustic population, into the form of a series of sketches. These, either by original design, or by the mode in which she happened to cast them, become connected together, as the book proceeds, by means of the characters, incidents, and fortunes involved in a rural love-match, which, like all other love, does not run quite smooth to its ending. The great merit of her book is its truth; which leaves a strong impression on the reader's mind."—SPECTATOR.

BEDFORD CORRESPONDENCE. — CORRESPONDENCE OF

JOHN, FOURTH DUKE OF BEDFORD, selected from the Originals at Woburn Abbey: with Introductions by LEYD JOHN RUSSELL.

8vo. Vol. 1 (1749-48), 18s. cloth; Vol. 2 (1749-60), 15s. cloth.

"The second volume of this publication includes a correspondence having relation to the period from the Peace of Aix-la-Chapelle to the death of George II. Its most remarkable portion bears upon an important question on which there exist some differences of opinion at the present time, viz. the intrigues which led to the junction of the Duke of Newcastle and Pitt, in 1767. The letters respecting the state of Ireland under the Viceroyalty of the Duke of Bedford, also here, are not a little interesting."—MORNING HERALD.

* Vol. 3, to complete the work, is nearly ready.

BELL.—LIVES OF THE MOST EMINENT ENGLISH POETS.

By ROBERT BELL, Esq. 2 vols. fcp. 8vo. with Vignette Titles, 12s. cloth.

BELL.—THE HISTORY OF RUSSIA,

From the Earliest Period to the Treaty of Tilsit. By ROBERT BELL, Esq. 3 vols. fcp. 8vo. with Vignette Titles, 18s. cloth.

BIOGRAPHICAL DICTIONARY

Of the Society for the Diffusion of Useful Knowledge. Half-volumes 1 to 7, (AA to AZ-ZUBBYDI, comprising the letter A), 8vo. 12s. each, cloth.

* Published Quarterly.—The work will probably not exceed Thirty Volumes.

"We have carefully examined the articles under letter A, now completed, and have no reason to complain of any want of uniformity. There seems to have been, on the whole, a judicious apportioning of space, according to the importance of the individual. In order to secure this necessary uniformity, a society, which had no pecuniary profit as its end, was more likely to succeed than a private publisher, or body of publishers. In style, execution, and completeness, the lives are far superior to those of any biographical dictionary with which we are acquainted. The only one, indeed, with which, for completeness, it can be compared, is the French 'Biographie Universelle,' but in this respect it has very greatly the advantage." [The reviewer institutes a comparison in favour of the English work, too long to be quoted, and ends his paragraph as follows:—] So that the Society's Dictionary must be regarded as a labour not only for Great Britain, but for Europe.—In all the articles there are two points in which they are fuller and more accurate than any previous work of the kind; and these are, the titles, dates, and places of publication of books, and their editions, and the sources from whence the materials have been derived for the biography."—ATHENÆUM.

BLACK.—A PRACTICAL TREATISE ON BREWING,

Based on Chemical and Economical Principles: with Formule for Public Brewers, and Instructions for Private Families. By WILLIAM BLACK. Third Edition, revised and corrected, with considerable Additions. The Additions revised by Professor Graham, of the London University. 8vo. 10s. 6d. cloth.

"This comprehensive and informing essay will be found invaluable to the practical brewer and private families; to the former we recommend it as a work ably treating of their art; to the latter, as one which will find an efficient and correct guide. This edition fully bears out the statement on the title-page—that it has been 'much enlarged and improved.'"—CERISE.

BLAINE.—AN ENCYCLOPÆDIA OF RURAL SPORTS;

Or, a complete Account, Historical, Practical, and Descriptive, of Hunting, Shooting, Fishing, Racing, and other Field Sports and Athletic Amusements of the present day. By DELABERE P. BLAINE, Esq. Author of "Outlines of the Veterinary Art," "Canine Pathology," &c. &c. Illustrated by nearly 600 Engravings on Wood, by R. Branstons, from Drawings by Alken, T. Landseer, Dicks, &c. 1 thick vol. 8vo. £2. 10s. cloth.

BLAIR'S CHRONOLOGICAL AND HISTORICAL TABLES,

From the Creation to the present time: with Additions and Corrections from the most authentic Writers; including the Computation of St. Paul, as connecting the Period from the Exode to the Temple. Under the revision of Sir HENRY ELLIS, K.H., Principal Librarian of the British Museum. Imperial 8vo. 31s. 6d. half-bound morocco.

"The arrangement adopted in this extended edition of Dr. Blair's valuable work is most admirable: each table comprising the space of half a century, and exhibiting, in parallel columns, contemporary kings and rulers, the chief events that marked the history of their time, and the most celebrated characters who flourished in their age. As an aid to the study of history, and as a general work of reference, the tables are of great utility, and we are satisfied that, as their merit becomes known, no one to whom they are accessible will ever take up a history without having this volume open before him. It is to our view an indispensable companion to every collection of history, however small."

BLOOMFIELD.—HISTORY OF THE PELOPONNESIAN WAR.

By THUCYDIDES. Newly translated into English, and accompanied with very copious Notes, Philological and Explanatory, Historical and Geographical. By the Rev. S. T. BLOOMFIELD, D.D. F.S.A. 3 vols. 8vo. with Maps and Plates, £2. 5s. boards.

BLOOMFIELD.—HISTORY OF THE PELOPONNESIAN WAR.

By THUCYDIDES. A New Recension of the Text, with a carefully amended Punctuation; and copious Notes, Critical, Philological, and Explanatory, almost entirely original, but partly selected and arranged from the best Expositors: accompanied with full Indexes, both of Greek Words and Phrases explained, and matters discussed in the Notes. The whole illustrated by Maps and Plans, mostly taken from actual surveys. By the Rev. S. T. BLOOMFIELD, D.D. F.S.A. 2 vols. 8vo. 38s. cloth.

BLOOMFIELD.—THE GREEK TESTAMENT:

With copious English Notes, Critical, Philological, and Explanatory. By the Rev. S. T. BLOOMFIELD, D.D. F.S.A. 5th Edition, improved. 2 vols. 8vo. with a Map of Palestine, £2. 2s. cloth.

BLOOMFIELD.—COLLEGE & SCHOOL GREEK TESTAMENT;

With English Notes. By the Rev. S. T. BLOOMFIELD, D.D. 3d Edition, greatly enlarged, and very considerably improved, 12mo. 10s. 6d. cloth.

BLOOMFIELD.—GREEK AND ENGLISH LEXICON TO THE

NEW TESTAMENT: especially adapted to the use of Colleges, and the Higher Classes in Public Schools; but also intended as a convenient Manual for Biblical Students in general. By Dr. BLOOMFIELD. Fcp. 8vo. 9s. cloth.

BOY'S OWN BOOK (THE):

A Complete Encyclopedia of all the Diversions, Athletic, Scientific, and Recreative, of Boyhood and Youth. 20th Edition, square 12mo. with many Engravings on Wood, 6s. boards.

BRANDE.—A DICTIONARY OF SCIENCE LITERATURE,

AND ART: comprising the History, Description, and Scientific Principles of every Branch of Human Knowledge; with the Derivation and Definition of all the Terms in General Use. Edited by W. T. BRANDE, F.R.S.L. & E.; assisted by JOSEPH CAUVIN, Esq. The various departments are by Gentlemen of eminence in each. 1 very thick vol. 8vo. illustrated with Wood Engravings, £3. cloth.

BRAY.—THE PHILOSOPHY OF NECESSITY;

Or, the Law of Consequences as applicable to Mental, Moral, and Social Science. By CHARLES BRAY. 2 vols. 8vo. 15s. cloth.

BREWSTER.—TREATISE ON OPTICS.

By SIR DAVID BREWSTER, LL.D. F.R.S., &c. New Edition. 1 vol. fcp. 8vo. Vignette Title, and 176 Woodcuts, 6s. cloth.

BRITTON.—THE ORIGINAL PICTURE OF LONDON:

With a Description of its Environs. Re-edited, and mostly re-written, by J. BRITTON, F.S.A. &c. 28th Edition, with upwards of 100 Views of Public Buildings, Plan of the Streets, and Two Maps, 18mo. 9s. neatly bound; with the Maps only, 6s. bound.

BULL.—HINTS TO MOTHERS,

For the Management of Health during the Period of Pregnancy and in the Lying-in Room; with an Exposure of Popular Errors in connection with those subjects. By THOMAS BULL, M.D. Physician Accoucheur to the Finsbury Midwifery Institution, &c. &c. 4th Edition, revised and considerably enlarged. Fcp. 8vo. 7s. cloth.

BULL.—THE MATERNAL MANAGEMENT OF CHILDREN,

in HEALTH and DISEASE. By T. BULL, M.D. Fcp. 8vo. 7s. cloth.

"Excellent guides, and deserve to be generally known."—JOHNSON'S MEDICO-CHIRURGICAL REVIEW.

BURDER.—ORIENTAL CUSTOMS,

Applied to the Illustration of the Sacred Scriptures. By SAMUEL BURDER, A.M. 3d Edit. with additions, fcp. 8vo. 8s. 6d. cloth.

Houses and Tents—Marriage—Children—Servants—Food and Drink—Dress and Clothing—Presents and Visiting—Amusements—Books and Letters—Hospitality—Travelling—Respect and Honour—Agriculture—Cattle and Beasts—Birds, Insects, and Reptiles—Fruit and Wine—Kings and Government—War—Punishments—Religion—Time and Seasons—Medicine—Funerals, &c.

BURNS.—THE PRINCIPLES OF CHRISTIAN PHILOSOPHY;

containing the Doctrines, Duties, Admonitions, and Consolations of the Christian Religion. By JOHN BURNS, M.D. F.R.S. 5th Edition, 12mo. 7s. boards.

Man is created for a Future State of Happiness; on the Means by which a Future State of Happiness is procured; of what is required of Man that he may obtain a Future State of Happiness; of the Nature of the Future State of Happiness; of the Preparation for the Future State of Happiness; of Personal Duties; of Relative Duties; of the Duties Men owe to God; of the Admonitions and Consolations afforded by the Christian Religion.

BURNS.—CHRISTIAN FRAGMENTS;

Or, Remarks on the Nature, Precepts, and Comforts of Religion. By JOHN BURNS, M.D. F.R.S. Professor of Surgery in the University of Glasgow. Author of "The Principles of Christian Philosophy." Fcp. 8vo. 6s. cloth.

"We recommend this volume with sincere pleasure to our readers, as an admirable manual of devotion, and a safe companion in seasons of distress."—*ATHENÆUM*.

BUTLER.—SKETCH OF ANCIENT & MODERN GEOGRAPHY.

By SAMUEL BUTLER, D.D. late Lord Bishop of Lichfield and Coventry; and formerly Head Master of Shrewsbury School. New Edition, revised by his Son, 8vo. 9s. boards.

The present edition has been carefully revised by the author's son, and such alterations introduced as continually progressive discoveries and the latest information rendered necessary. Recent Travels have been constantly consulted where any doubt or difficulty seemed to require it; and some additional matter has been added, both in the ancient and modern part.

BUTLER.—ATLAS OF MODERN GEOGRAPHY.

By the late Dr. BUTLER. New Edition; consisting of Twenty-three coloured Maps, from a New Set of Plates. 8vo. with Index, 12s. half-bound.

BUTLER.—ATLAS OF ANCIENT GEOGRAPHY;

Consisting of Twenty-three coloured Maps. With Index. By the late Dr. BUTLER. New Edition. 8vo. 12s. half-bound.

. The above two Atlases may be had, half-bound, in One Volume, 4to. price 24s.

CALLCOTT.—A SCRIPTURE HERBAL.

With upwards of 120 Wood Engravings. By LADY CALLCOTT. Square crown 8vo. pp. 568, £1. 5s. cloth.

"The Herbal is executed in a very meritorious and interesting manner. All the vegetable productions mentioned in the Scriptures are alphabetically enumerated and described, and the texts in which they occur cited; the properties of the various plants are stated under each, and, where critical opinions differ as to their identification, compared, with the authors' judgment on the conflicting testimony. Beautiful woodcuts illustrate all the specimens, whilst the authors' travels have enabled her to offer many original remarks of an interesting kind. Finally, the whole is seasoned with appropriate quotations and reflections to relieve the drier points of inquiry, and blend the pleasing with the instructive, in an elegant style, than which nothing could be better adapted to the nature of the volume: and when we have added that the book is altogether AN EXCELLENT BIBLE COMPANION, we can bestow no higher praise."—*LITERARY GAZETTE*.

CARLÉN (EMILIE).—THE ROSE OF TISTELÖN:

A Tale of the Swedish Coast. By EMILIE CARLÉN. Translated from the original Swedish. 2 vols. post 8vo. 21s. boards.

"Many passages descriptive of manners, character, or nature, might be quoted from this novel, possessing all the power, truth, and finish of a Flemish painting. Notwithstanding its late appearance before the English public, its Swedish scenery and manners have nearly as much novelty as *THE NEIGHBOURS*. The domestic economy and hard life of the poor fishermen in the remote and sea-beaten villages along the Swedish coast, the little shopkeepers or merchants, the wrecking smugglers, and custom-house officers, with the miscellaneous persons that fill up the interstices of these classes, are all painted to the life, as well as the 'interiors,' and the few forms of landscape around them."—*SPECTATOR*.

CATLOW.—POPULAR CONCHOLOGY;

Or, the Shell Cabinet arranged: being an Introduction to the Modern System of Conchology: with a sketch of the Natural History of the Animals, an account of the Formation of the Shells, and a complete Descriptive List of the Families and Genera. By AGNES CATLOW. Fcp. 8vo. with 312 Woodcuts, 10s. 6d. cloth.

"This admirable little work is designed to facilitate the study of natural history, daily becoming more attractive, not only from its intrinsic interest, but also from its multiplied relations with geology. It will furnish the young entomologist with an elementary manual, which, though scientific in its form, is, by the simplicity of its method, and the familiarity of its style, calculated effectually to assist him in the early steps of his progress in this fascinating pursuit."—*ST. JAMES'S CHRONICLE*.

"A pleasant, useful, and well-illustrated volume."—*JAMESON'S EDIN. PHILOS. JOURNAL*.

CHALENOR.—POETICAL REMAINS OF MARY CHALENOR.

Fcp. 8vo. 4s. cloth.

"The poems are sweetly natural, and, though on topics often sung, breathe a tenderness and melancholy which are at once soothing and consolatory."—*LITERARY GAZETTE*.

CHALENOR.—WALTER GRAY,

A Ballad, and other Poems. 2d Edition, including the Poetical Remains of Mary Chalenor. Fcp. 8vo. 6s. cloth.

"As the simple and spontaneous effusions of a mind apparently filled with feelings which render the fireside happy, and unobscured with affectation or verbiage, they may with benefit be received into the 'happy homes of England,' and offered as a gift to the youthful of both sexes."—*CHAMBERS'S EDINBURGH JOURNAL*.

CHINA.—THE LAST YEAR IN CHINA,

To the Peace of Nanking: as sketched in Letters to his Friends, by a Field Officer actively employed in that Country. With a few concluding Remarks on our Past and Future Policy in China. 2d edition, revised. Fcp. 8vo. with Map, 7s. cloth.

CHINESE NOVEL.—RAMBLES OF THE EMPEROR CHING

TH in Kéang Nan: a Chinese Tale. Translated by Tkin Shen; with a Preface by JAMES LEECH, D.D. 2 vols. post 8vo. 21s. cloth.

"These rambles of the Haroun Atrachid of the Celestial Empire give a very curious, and, at the present moment, a peculiarly interesting view of Chinese opinions, usages, and institutions."—*TAIT'S MAGAZINE*.

CHORLEY.—MUSIC AND MANNERS IN FRANCE AND

GERMANY: a Series of Travelling Sketches of Art and Society. By H. F. CHORLEY, Esq. Author of "Conti." 3 vols. post 8vo. 31s. 6d. boards.

CLAVERS.—FOREST LIFE.

By MARY CLAVERS, an Actual Settler; Author of "A New Home, Who 'll Follow?" 2 vols. fcp. 8vo. 12s. cloth.

COLTON.—LACON; OR, MANY THINGS IN FEW WORDS.

By the Rev. C. C. COLTON. New Edition, 8vo. 12s. cloth.

CONVERSATIONS ON BOTANY.

9th Edition, improved. Fcp. 8vo. 22 Plates, 7s. 6d. cloth; with the plates coloured, 12s. cloth.

The object of this work is to enable children and young persons to acquire a knowledge of the vegetable productions of their native country, by introducing to them, in a familiar manner, the principles of the Linnæan System of Botany. For this purpose, the arrangement of Linnæus is briefly explained, a native plant of each class, with a few exceptions, is examined, and illustrated by an engraving, a short account is added of some of the principal foreign species.

CONVERSATIONS ON MINERALOGY.

With Plates, engraved by Mr. and Mrs. Lowry, from Original Drawings. 3d Edition, enlarged. 2 vols. 12mo. 14s. cloth.

COOLEY.—THE HISTORY OF MARITIME AND INLAND

DISCOVERY. By W. D. COOLEY, Esq. 3 vols. fcp. 8vo. with Vignette Titles, 18s. cloth.

COPLAND.—A DICTIONARY OF PRACTICAL MEDICINE;

comprising General Pathology, the Nature and Treatment of Diseases, Morbid Structures, and the Disorders especially incidental to Climates, to Sex, and to the different Epochs of Life, with numerous approved Formulae of the Medicines recommended. By JAMES COPLAND, M.D., Consulting Physician to Queen Charlotte's Lying-in Hospital; Senior Physician to the Royal Infirmary for Children; Member of the Royal College of Physicians, London; of the Medical and Chirurgical Societies of London and Berlin, &c. Vols. 1 and 2, 8vo. £3, cloth; and Part 3, 4s. 6d. * * To be completed in one more volume.

CROCKER'S ELEMENTS OF LAND SURVEYING.

Fifth Edition, corrected throughout, and considerably improved and modernized, by T. G. BURN, Land Surveyor, Bristol. To which are added, TABLES OF SIX-FIGURE LOGARITHMS, &c., superintended by RICHARD FARLEY, of the Nautical Almanac Establishment. 1 vol. post 8vo. 12s. cloth.

* * The work throughout is entirely revised, and much new matter has been added, there are new chapters, containing very full and minute Directions relating to the modern Practice of Surveying, both with and without the aid of angular instruments. The method of Plotting Estates, and Casting or Computing their Areas, are described, &c. &c. The chapter on Levelling also is new.

CROWE.—THE HISTORY OF FRANCE,

From the Earliest Period to the Abdication of Napoleon. By E. E. CROWE, Esq. 3 vols. fcp. 8vo. with Vignette Titles, 18s. cloth.

DAIHMANN.—HISTORY OF THE ENGLISH REVOLUTION.

By F. C. DAHMANN, late Professor of History at the University of Göttingen. Translated from the German, by H. EVANS LLOYD. 8vo. 10s. 6d. cloth.

"Professor Daihmann's book is, in short, a rapid sketch of the whole of what we call the Modern History of England, from its start at the Coronation of Henry the Seventh, to its intermediate settlement at the Coronation of William the Third. We have no English summary of the history it relates, so brief, comprehensive, and impartial. Mr. Daihmann is a very earnest as well as intelligent writer, and the steady advance of the popular principle in England, through an almost uninterrupted march of two centuries, is startlingly reflected in his clear and transparent relation. Mr. Lloyd's translation is very well executed."—EXAMINER

DAVY (SIR HUMPHRY).—AGRICULTURAL CHEMISTRY:

With Notes by Dr. JOHN DAVY. 6th Edition, 8vo. with 10 Plates, 15s. cloth.

CONTENTS.—Introduction.—The General Powers of Matter which influence Vegetation.—The Organization of Plants.—Soils.—Nature and Constitution of the Atmosphere, and its influence on Vegetables.—Manures of Vegetable and Animal Origin.—Manures of Mineral Origin, or Fossil Manures.—Improvement of Lands by Burning.—Experiments on the Nutritive Qualities of different Grasses, &c.

DE CUSTINE.—RUSSIA.

By the MARQUIS DE CUSTINE. Translated from the French. 2d Edition, 3 vols. post 8vo. 31s. 6d. cloth.

"We are inclined to think—and it is a painful reflection—that Mons. De Custine's remarkable volumes contain a more accurate account of the state and constitution of Russia than any other work of recent date, without exception. The author has manfully penetrated through that superficial glitter and gorgeous array which have blinded the eyes of too many travellers to the imperfections and defects of this great empire, and has shown it as it really is. To do this in the case of Russia requires many and favourable opportunities of observation, considerable shrewdness, and a courage and determination not easily to be doubted, all which Mons. De Custine has proved himself to have possessed in an eminent degree, and the result is, a work which those who are desirous to know Russia as it really is, and not as it would fain impose itself on the world to be, would do well to consult. We promise our readers equal surprise and pleasure from the perusal of his very clever book."—GENTLEMAN'S MAGAZINE.

DE LA BECHIE.—REPORT ON THE GEOLOGY OF CORN-

WALL, DEVON, and WEST SOMERSET. By HENRY T. DE LA BECHIE, F.R.S. &c., Director of the Ordnance Geological Survey. Published by Order of the Lords Commissioners of H.M. Treasury. 8vo. with Maps, Woodcuts, and 12 large Plates, 14s. cloth.

DE MORGAN.—AN ESSAY ON PROBABILITIES,

And on their Application to Life Contingencies and Insurance Offices. By AUG. DE MORGAN, of Trinity College, Cambridge. 1 vol. fcp. 8vo. with Vignette Title, 6s. cloth.

DOCTOR (THE), &c.

5 vols. post 8vo. £2. 12s. 6d. cloth.

"Admirably as the mystery of the 'Doctor' has been preserved up to the present moment, there is no longer any reason for affecting secrecy on the subject. The author is Robert Southey: he acknowledged the fact shortly before his last illness to his most confidential friend, an M.P. of high character. In a private letter from Mrs. Southey, dated February 27, 1843, she not only states the fact, but adds that the greater part of a sixth volume had gone through the press, and that Southey looked forward to the pleasure of drawing her into it as a contributor, giving her full authority to affirm that her husband is the author."—ROBERT BELL, Esq. in *THE STONY TELLER*.

DODDRIDGE.—THE FAMILY EXPOSITOR;

Or, a Paraphrase and Version of the New Testament: with Critical Notes, and a Practical Improvement of each Section. By P. DODDRIDGE, D.D. To which is prefixed, a Life of the Author, by A. KIPPIE, D.D. F.R.S. and S.A. New Edition, 4 vols. 8vo. £1. 16s. cloth.

DONOVAN.—TREATISE ON CHEMISTRY.

By M. DONOVAN, M.R.I.A. Fourth Edition, 1 vol. fcp. 8vo. with Vignette Title, 6s. cloth.

DONOVAN.—A TREATISE ON DOMESTIC ECONOMY.

By M. DONOVAN, Esq. M.R.I.A. Professor of Chemistry to the Company of Apothecaries in Ireland. 2 vols. fcp. 8vo. with Vignette Titles, 12s. cloth.

DOVER.—LIFE OF FREDERICK II. KING OF PRUSSIA.

By LORD DOVER. 2d Edition, 2 vols. 8vo. with Portrait, 28s. boards.

DRUMMOND.—FIRST STEPS TO BOTANY,

Intended as popular Illustrations of the Science, leading to its study as a branch of general education. By J. L. DRUMMOND, M.D. 4th Edit. 12mo. with numerous Woodcuts, 9s. bds.

DUNHAM.—THE HISTORY OF THE GERMANIC EMPIRE.

By Dr. DUNHAM. 3 vols. fcp. 8vo. with Vignette Titles, 18s. cloth.

THE HISTORY OF EUROPE DURING THE MIDDLE AGES. By Dr. Dunham. 4 vols. fcp. 8vo. with Vignette Titles, £7. 4s. cloth.

THE HISTORY OF SPAIN AND PORTUGAL. By Dr. Dunham. 5 vols. fcp. 8vo. with Vignette Titles, £1. 10s. cloth.

THE HISTORY OF SWEDEN, DENMARK, AND NORWAY. By Dr. Dunham. 3 vols. fcp. 8vo. with Vignette Titles, 18s. cloth.

THE HISTORY OF POLAND. By Dr. Dunham. 1 vol. fcp. 8vo. with Vignette Title, 6s. cloth.

THE LIVES OF THE EARLY WRITERS OF GREAT BRITAIN. By Dr. Dunham, R. Bell, Esq. &c. 1 vol. fcp. 8vo. with Vignette Title, 6s. cloth.

THE LIVES OF BRITISH DRAMATISTS. By Dr. Dunham, R. Bell, Esq. &c. 2 vols. fcp. 8vo. with Vignette Titles, 12s. cloth.

EGERTON.—A TREATISE ON PHOTOGRAPHY;

Containing the latest Discoveries appertaining to the Daguerreotype. Compiled from Communications by MM. Daguerre and Arago, and other Eminent Men of Science. By N. P. LEBREURS, Optician to the Observatory, Paris, &c. Translated by J. EGERTON. Post 8vo. with Plate of Apparatus, 7s. 6d. cloth.

"A translation of M. Lebreurs' celebrated 'Treatise on Photography.' This work will be peculiarly acceptable to the scientific world, containing, as it does, the latest discoveries and improvements in the art of which it treats; together with a vast variety of practical instructions, valuable hints respecting the chance of plates, apparatus, &c., indeed, all the details and minutiae necessary to lead to successful results."—*EXAMINER*.

ELLIOTSON.—HUMAN PHYSIOLOGY:

With which is incorporated much of the elementary part of the "*Institutiones Physiologicae*" of J. F. Blumenbach, Professor in the University of Göttingen. By JOHN ELLIOTSON, M.D. Cantab. F.R.S. Fifth Edition, 8vo. with numerous Woodcuts, £2. 2s. cloth.

ENGLISHMAN'S HEBREW AND CHALDEE CONCORDANCE

OF THE OLD TESTAMENT; being an attempt at a Verbal Connection between the Original and the English Translations, with Indexes, a List of the Proper Names and their occurrences, &c. &c. 2 vols. royal 8vo. cloth, £3. 13s. 6d.; large paper, £4. 14s. 6d.

"The labour bestowed upon this important work has seldom, we should suppose, been equalled; and we have the fullest conviction, from the merely cursory examination we are able to give to such a stupendous task, that the result justifies all the labour, time, and money expended upon it. Indeed, the whole book bears the most palpable evidence of honest carefulness and unwearying diligence (the points of prime worth in a Concordance); and wherever we have dipped into its pages (about 1600), we have, in every case, had our opinion of its neatness, accuracy, and lucid order, confirmed and increased."—*LITERARY GAZETTE*.

FAREY.—A TREATISE ON THE STEAM ENGINE,

Historical, Practical, and Descriptive. By JOHN FAREY, Engineer. 4to. Illustrated by numerous Woodcuts, and 25 Copper-plates. £5. 5s. boards.

FERGUS.—HISTORY OF UNITED STATES OF AMERICA,

From the Discovery of America to the Election of General Jackson to the Presidency. By the Rev. H. FERGUS. 2 vols. fcp. 8vo. with Vignette Title, 12s. cloth.

FIELD.—POSTHUMOUS EXTRACTS FROM THE VETERINARY RECORDS OF THE LATE JOHN FIELD. Edited by his Brother, WILLIAM FIELD, Veterinary Surgeon, London. 8vo. 8s. boards.

"A collection of remarkable cases of disease in the horse, observed by the late Mr. Field, during his extensive practice, with a few papers on particular diseases, either read before the Veterinary Medical Society, or, seemingly, sketched with that end in view. To pass a decided judgment on the veterinary value of the volume is beyond our power; but the cases appear to be noted with great clearness in their symptoms, treatment, and post-mortem examination. We should conceive the work likely to be of considerable use to veterinary surgeons,—who, lucky people, do not as yet appear overburdened with books on their business,—and not without interest to the medical practitioner, who would study comparative surgery, as well as comparative anatomy."—SPECTATOR.

FORD.—THE NEW DEVOUT COMMUNICANT,

According to the Church of England; containing an Account of the Institution, Prayers, and Meditations, before and after the Administration, and a Companion at the Lord's Table. By the Rev. JAMES FORD, B.D. 7th Edition, 18mo. 2s. 6d. bound in cloth, with gilt edges; fcp. 8vo. 3s. 6d. bound.

FORD.—A CENTURY OF CHRISTIAN PRAYERS,

On FAITH, HOPE, and CHARITY; with a Morning and Evening Devotion. By the Rev. JAMES FORD, B.D. 3d Edition, 18mo. 4s. cloth.

FORSTER.—THE STATESMEN OF THE COMMONWEALTH

OF ENGLAND. With an Introductory Treatise on the Popular Progress in English History. By JOHN FORSTER, Esq. 5 vols. fcp. 8vo. with Original Portraits of Pym, Eliot, Hampden, Cromwell, and an Historical Scene after a Picture by Cattermole, £1. 10s. cloth. The Introductory Treatise, intended as an Introduction to the Study of the Great Civil War in the Seventeenth Century, separately, 2s. 6d. sewed. The above 5 vols. form Mr. Forster's portion of the Lives of Eminent British Statesmen, by Sir James Mackintosh, the Right Hon. T. P. Courtenay, and John Forster, Esq. 7 vols. fcp. 8vo. with Vignette Titles, £2. 2s. cloth.

FOSBROKE.—A TREATISE ON THE ARTS, MANNERS, MANUFACTURES, and INSTITUTIONS OF THE GREEKS and ROMANS. By the Rev.

T. D. FOSBROKE, &c. 2 vols. fcp. 8vo. with Vignette Titles, 12s. cloth.

FRANKUM.—DISCOURSE ON THE ENLARGED AND

PENDULOUS ABDOMEN, showing it to be a visceral affection attended with important consequences in the Human Economy; with cursory Observations on Diet, Exercise, and the general Management of Health: for the use of Dyspeptics. By R. FRANKUM, Esq. Surgeon. The Second Edition, augmented, with a Dissertation on Gout, suggesting new physiological views as to its Cause, Prevention, and the best Course of Treatment. Fcp. 8vo. pp. 126, 5s. cloth.

GLEIG.—LIVES OF MOST EMINENT BRITISH MILITARY

COMMANDERS. By the Rev. G. R. GLEIG. 3 vols. fcp. 8vo. with Vignette Titles, 18s. cloth.

GLENDINNING.—PRACTICAL HINTS ON THE CULTURE

OF THE PINE APPLE. By R. GLENDINNING, Gardener to the Right Hon. Lord Rolie, Bicton. 12mo. with Plan of a Pinery, 5s. cloth.

GOOD.—THE BOOK OF NATURE.

A Popular Illustration of the General Laws and Phenomena of Creation. By JOHN MASON GOOD, M.D. F.R.S., &c. Third Edition, corrected, 3 vols. fcp. 8vo. 24s. cloth.

GRAHAM.—ENGLISH; OR, THE ART OF COMPOSITION

explained in a Series of Instructions and Examples. By G. F. GRAHAM. Second Edition, revised and improved. Fcp. 8vo. 7s. cloth.

GRAHAM.—HELPS TO ENGLISH GRAMMAR;

Or, Easy Exercises for Young Children. By G. F. GRAHAM. Illustrated by Engravings on Wood. Fcp. 8vo. 3s. cloth.

"Well adapted for the instruction of young children, for whose use it is especially designed."—ATHENÆUM.

GRANT (MRS. OF LAGGAN).—MEMOIR AND CORRE-

SPONDENCE OF the late Mrs. Grant, of Laggan, Author of "Letters from the Mountains," "Memoirs of an American Lady," &c. &c. Comprising Sketches of the Society and Literary Characters of Edinburgh for nearly the last thirty years. Edited by her Son, J. P. GRANT, Esq. 3 vols. post 8vo. with Portrait, 31s. 6d. cloth.

"The three volumes consist of a brief sketch of Mrs. Grant's life (drawn up by herself to the year 1806, and continued by her sons), and of her letters written to various friends, between 1813, when she left Laggan for Woodend, and within a few months of her death, in 1836. The nature of this correspondence is domestic, though often interspersed with remarks on the books she was reading, or sketches of the persons she had met. There are also very many passages of a biographical character, but the great bulk of the book is private and personal—letters of compliment and condolence, the effusions of friendship or pity, accounts of her domestic affairs, or sketches of the persons, often great names in literature and life, both of London and Edinburgh, whom she had met in society, both readable and attractive."—SPECTATOR.

GRATTAN.—THE HISTORY OF THE NETHERLANDS,

From the Invasion by the Romans to the Belgian Revolution in 1830. By T. C. GRATTAN, Esq. 1 vol. fcp. 8vo. with Vignette Title, 6s. cloth.

GRAY.—FIGURES OF MOLLUSCOUS ANIMALS,

Selected from various Authors. Etched for the Use of Students. By MARIA EMMA GRAY. Vol. I. pp. 40, with 78 plates of Figures, 12s. cloth.

GRAY AND MITCHELL'S ORNITHOLOGY.—THE GENERA

OF BIRDS; comprising their Generic Characters, a Notice of the Habits of each Genus, and an extensive List of Species, referred to their several Genera. By GEORGE ROBERT GRAY, Acad. Imp. Georg. Florent. Soc. Corresp. Senior Assistant of the Zoological Department, British Museum; and Author of the "List of the Genes of Birds," &c. &c. Illustrated with Three Hundred and Fifty imperial quarto Plates, by DAVID WILLIAM MITCHELL.

In course of publication, in Monthly Parts, 10s. 6d. each; each Part consisting generally of Four imperial quarto coloured Plates and Three plain, and accompanying Letterpress; giving the Generic Characters, short Remarks on the Habits, and a List of Species of each Genus as complete as possible. The uncoloured Plates contain the Characters of all the Genera of the various Sub-families, consisting of numerous details of Heads, Wings, and Feet, as the case may require, for pointing out their distinguishing Characters.

*The work will not exceed Fifty Monthly Parts. No. 5 was published Sept. 2d.

GREENER.—THE GUN;

Or, a Treatise on the various Descriptions of Small Fire-Arms. By W. GREENER, Inventor of an improved method of Firing Cannon by Percussion, &c. 8vo. with Illustrations, 15s. boards.

GREENER.—THE SCIENCE OF GUNNERY,

As applied to the Use and Construction of Fire Arms. By WILLIAM GREENER, Author of "The Gun," &c. With numerous Plates, 15s. cloth.

GREENWOOD (COL.)—THE TREE-LIFTER;

Or, a New Method of Transplanting Trees. By Col. GEO. GREENWOOD. 8vo. with an Illustrative Plate, 7s. cloth.

GUEST.—THE MABINOIGION,

From the Llyfr Coch o Hergest, or Red Book of Hergest, and other ancient Welsh MSS.: with an English Translation and Notes. By Lady CHARLOTTE GUEST. Parts 1 to 5. Royal 8vo. 8s. each.

Part 1. The Lady of the Fountain.

Part 2. Peredur Ab Eyrwac; a Tale of Chivalry.

Part 3. The Arthurian Romance of Geraint, the Son of Erbin.

Part 4. The Romance of Kilhwch and Olwen.

Part 5. The Dream of Rhodriabwy, and the Tale of Pryll Prince of Dyved.

GWILT.—AN ENCYCLOPÆDIA OF ARCHITECTURE;

Historical, Theoretical, and Practical. By JOSEPH GWILT, Esq. F.S.A. Illustrated with upwards of 1000 Engravings on Wood, from Designs by J. S. GWILT. In 1 thick vol. 8vo. containing nearly 1340 closely-printed pages, £2. 12s. 6d. cloth.

"Guilt's Encyclopædia ranks high as a work for professional students, containing the mathematics of architecture, with copious details upon all the technicalities of the science. It is a work which no professed architect or builder should be without."—WESTMINSTER REVIEW.

HALL.—NEW GENERAL LARGE LIBRARY ATLAS OF

FIFTY-THREE MAPS, on Colomblor Paper; with the Divisions and Boundaries carefully coloured. Constructed entirely from New Drawings, and engraved by SIDNEY HALL. New Edition, thoroughly revised and corrected; including all the Alterations rendered necessary by the recent Official Surveys, the New Roads on the Continent, and a careful Comparison with the authenticated Discoveries published in the latest Voyages and Travels. Folded in half, Nine Guineas, half-bound in Russia; full size of the Maps, Ten Pounds, half-bd. Russia.

The following Maps have been re-engraved, from entirely new designs—Ireland, South Africa, Turkey in Asia, the following have been materially improved—Switzerland, North Italy, South Italy, Egypt, Central Germany, Southern Germany, Greece, Austria, Spain and Portugal, a new map of China, corrected from the recent government survey of the coast from Canton to Nankin (to which is appended, the Province of Canton, on an enlarged scale, in a separate compartment), has since been added.

HALSTED.—LIFE AND TIMES OF RICHARD THE THIRD,

as Duke of Gloucester and King of England: in which all the Charges against him are carefully investigated and compared with the Statements of the Contemporaneous Authorities. By CAROLINE A. HALSTED, Author of "The Life of Margaret Beaufort, Mother of King Henry VII." and "Obligations of Literature to the Mothers of England." 2 vols. 8vo. with a Portrait from an Original Picture in the possession of the Right Hon. Lord Stafford, never before engraved, and other illustrations, £1. 10s. cloth.

"We consider Miss Halsted's work as one of the most interesting and able pieces of history which has ever been presented to the world. The research which it manifests is most extensive, the arrangement clear and fund, the style always animated and picturesque. Many new lights are thrown on the career of Richard, many new facts elicited, and the injustice of four centuries vindicated by this intrepid and indefatigable champion of historical truth."—METROPOLITAN MAGAZINE.

HANNAM.—THE ECONOMY OF WASTE MANURES:

a Treatise on the Nature and Use of Neglected Fertilizers. By JOHN HANNAM. Written for the Yorkshire Agricultural Society, and published by permission of the Council. Fcp. 8vo. 3s. 6d. cloth.

"We consider this an invaluable treatise. It must prove of incalculable benefit to that class to whom it is chiefly addressed. By the general reader it will likewise be perused with no common interest. It is a lucid, practical demonstration from beginning to end. The writer is not only entirely master of his subject, but he has unfolded it in the most scientific, and, we would add, logical manner. He has displayed so marked a precision in his exposition, that the dullest capacity may at once comprehend his meaning and the drift of his argument."—ATLAS.

HAND-BOOK OF TASTE;

Or, How to Observe Works of Art, especially Cartoons, Pictures, and Statues. By FABIUS PICTOR. Second Edition. Fcp. 8vo. 3s. boards.

"We have never met with a compendious treatise on art, and the principles which should guide taste in judging of its productions, that contained more excellent matter than this small unpretending volume. It is expressly compiled for the instruction of the public, and with a view to that era in art which the decoration of the new Houses of Parliament, and the present display of the cartoons in Westminster Hall, may be expected to create. It exhibits the opinions of the best artists and critics of all ages. It is not intended to instruct the student in art, though he may profit much by its lessons, but to tell the observer how he may judge of the productions of the fine arts. It is not flattering to set out with saying that England, in the art of design, is not only immeasurably behind Italy, but falls short of what France aspires to, and Germany has accomplished, but this is qualified by the admission that England is, nevertheless, quite capable of efficient progress.

"The following rules, and those which precede them, should be well scanned over before visiting exhibitions, and afterwards stitched up with our catalogue."—*TAIT'S MAGAZINE*

HANSARD.—TROUT AND SALMON, FISHING IN WALES.

By G. A. HANSARD. 12mo. 6s. 6d. cloth.

HARRIS.—THE HIGHLANDS OF ETHIOPIA;

Being the Account of Eighteen Months' Residence of a British Embassy to the Christian Court of Shoa. By Major W. C. HARRIS, Author of "Wild Sports in Southern Africa," &c. 2d Edition, 3 vols. with Map and Illustrations. £2. 2s. cloth.

"Sir William Harris has produced a work of extraordinary interest and value; a narrative which will take a permanent place in the library, as the best authority ever yet given to the world on all the subjects to which it relates. It has, moreover, for present readers, the charm of perfect freshness and novelty. The writer's inquiries extend to the minutest particulars of the habits, manners, customs, political and social economy of the people, among whom he was a welcomed visitor. He makes research into their history, sketches the geography, natural history, and botany of the country, and, in brief, leaves no subject unexplored that could add to the completeness of the picture he has undertaken to paint, and most virally does his graphic touch summon before the mind's eye of his readers the scenes he has witnessed."—*FOREIGN AND COLONIAL REVIEW*.

HAWKER.—INSTRUCTIONS TO YOUNG SPORTSMEN.

In all that relates to Guns and Shooting. By Lieut.-Col. P. HAWKER. 9th Edit. corrected, enlarged, and improved, with Eighty-five Plates and Woodcuts by Adlard and Branston, from Drawings by C. Varley, Dickes, &c. 8vo. ± 1. 1s. cloth.

"We have so often spoken favourably of preceding editions of this popular work, that we need only notice the opportune publication of the NINTH, which has just made its appearance, and which brings every branch of sporting, in relation to the field and gun, down to the present time, giving interesting notes of whatever has been done in the way of change and improvement."—*LITERARY GAZETTE*.

HENSLOW.—THE PRINCIPLES OF DESCRIPTIVE AND PHYSIOLOGICAL BOTANY.

By J. S. HENSLOW, M.A. F.L.S. &c. 1 vol. fcp. 8vo. with Vignette Title, and nearly 70 Woodcuts, 6s. cloth.

HERSCHEL.—A TREATISE ON ASTRONOMY.

By Sir JOHN HERSCHEL. New Edition. 1 vol. fcp. 8vo. Vignette Title, 6s. cloth.

HERSCHEL.—A PRELIMINARY DISCOURSE ON THE

STUDY OF NATURAL PHILOSOPHY. By Sir JOHN HERSCHEL. New Edition, 1 vol. fcp. 8vo. with vignette title, 6s. cloth.

HINTS ON ETIQUETTE AND THE USAGES OF SOCIETY:

With a Glance at Bad Habits. By *Amyrys*. "Manners make the man." 23d Edition, revised (with additions) by a Lady of Rank. Fcp. 8vo. 2s. 6d. cloth, gilt edges.

General Observations; Introductions—Letters of Introduction—Marriage—Dinners—Smoking; Snuff—Fashion—Dress—Music—Dancing—Conversation—Advice to Tradespeople—Visiting; Visiting Cards—Cards—Tattling—Of General Society.

HOARE.—A DESCRIPTIVE ACCOUNT OF A NEW METHOD

• OF PLANTING AND MANAGING the ROOTS OF GRAPE VINES. By CLEMENT HOARE, Author of "A Treatise on the Cultivation of the Grape Vine on Open Walls." 12mo. 5s. cloth.

The facts, proved by experiments carried on by Mr. Hoare for a series of years, are so extraordinary, that there is every reason to believe they will effect a complete revolution in the planting of the Grape Vine.

HOARE.—A PRACTICAL TREATISE ON THE CULTIVATION

OF THE GRAPE VINE ON OPEN WALLS. By CLEMENT HOARE. 3d Edition, 8vo. 7s. 6d. cloth.

HOBBS.—ENGLISH WORKS OF THOMAS HOBBS,

Of Malmesbury; now first collected by Sir WILLIAM MOLESWORTH, Bart. Vol. 10, containing the Translation of Homer's Iliad and Odyssey. 8vo. 10s. cloth; to non-subscribers, 12s.

Nine preceding Volumes have been published of the English and Latin Works. Vols. 8 and 9, recently published, comprise the Translation of Thucydides.

HOLLAND.—PROGRESSIVE EDUCATION;

Or, Considerations on the Course of Life. Translated from the French of Madame Necker de Saussure. By Miss HOLLAND. 3 vols. fcp. 8vo. 19s. 6d. cloth.

. The Third Volume, forming an appropriate conclusion to the first two, separately, 7s. 6d.

HOLLAND.—A TREATISE ON THE MANUFACTURES IN METAL.

By J. HOLLAND, Esq. 3 vols. fcp. Vignette Titles, about 300 Woodcuts, 18s. cloth.

HOLLAND.—MEDICAL NOTES AND REFLECTIONS.

By HENRY HOLLAND, M.D. F.R.S. &c. Fellow of the Royal College of Physicians, Physician Extraordinary to the Queen, and Physician in Ordinary to His Royal Highness Prince Albert. 2d Edition, 1 vol. 8vo. pp. 654, 18s. cloth.

HOOKE. — THE BRITISH FLORA,

In Two Vols. Vol. 1; comprising Phanogamous or Flowering Plants, and the Ferns. By Sir WILLIAM JACKSON HOOKER, K.H. LL.D. F.R.A. and L.S. &c. &c. Fifth Edition, with Additions and Corrections; and 173 Figures illustrative of the Umbelliferous Plants, the Composite Plants, the Grasses, and the Ferns. 8vo. pp. 502, with 12 Plates, 14s. plain; with the plates coloured, 24s. cloth.

Vol. 2, in Two Parts, comprising the Cryptogamia and Fungi, completing the British Flora, and forming Vol. 5; Parts 1 and 2, of Smith's English Flora, 24s. boards.

HOOKE. — ICONES PLANTARUM ;

Or, Figures, with brief Descriptive Characters and Remarks, of New and Rare Plants, selected from the Author's Herbarium. By Sir W. J. HOOKE, K.H. LL.D. &c. 4 vols. 8vo. with 400 Plates, £5. 12s. cloth.

HOOKE AND TAYLOR. — MUSCOLOGIA BRITANNICA.

Containing the Mosses of Great Britain and Ireland, systematically arranged and described; with Plates, illustrative of the character of the Genera and Species. By Sir W. J. HOOKE and T. TAYLOR, M.D. F.L.S., &c. 2d Edition, 8vo. enlarged, 31s. 6d. plain; & 3s. coloured.

HORSLEY (BISHOP). — BIBLICAL CRITICISM

On the first Fourteen Historical Books of the Old Testament; and on the first Nine Prophetical Books. By SAMUEL HORSLEY, LL.D. F.R.S. F.S.A. Lord Bishop of St. Asaph. 2d Edition, containing Translations by the Author never before published, together with copious Indices. 2 vols. 8vo. £1. 10s. cloth.

HOWITT (MARY). — THE CHILD'S PICTURE AND VERSE

BOOK, commonly called "Otto Speckter's Fable Book." Translated by MARY HOWITT: With French and German on corresponding pages, and illustrated with 100 Engravings on Wood by G. F. Sargent. Square 12mo. 10s. 6d. boards.

"Otto Speckter's illustrations are well calculated to please children: some by their truth, others by their humour. The verses, too, are in a kindly spirit—some shew some chiding in those coral and bells measures which ought never to be out of the ear of such as write for the very young. Mrs. Howitt has, in naturalizing this book, done a good deal with a good grace."—*ATHENÆUM*.

HOWITT (MARY). — THE H ——— FAMILY: TRALINNAN ;

AXEL and ANNA; and other Tales. By FREDRIKA BREMER. Translated by MARY HOWITT. 2 vols. post 8vo. with Portrait of the Author, 21s. boards.

"One great charm of Fredrika Bremer is her quiet way of doing every thing. Whether she sinks into the mysticism of German metaphysics, or gives the gossip of the tea table—whether she attires the most boring sarcasm, or gives expression to the kindest feeling, it is all done without the least appearance of effort. This elegant repose pervades her story of the H Family, and makes us like it in some respects better than any other of her writings."—*JOHN BURN*.

THE NEIGHBOURS.

A Story of Every-day Life in Sweden. By FREDRIKA BREMER. Translated by MARY HOWITT. 3d Edition, revised and corrected. 2 vols. post 8vo. 18s. boards.

THE HOME.

Or, Family Cares and Family Joys. By FREDRIKA BREMER. Translated by MARY HOWITT. 2d Edition, revised and corrected, 8 vols. post 8vo. 21s. boards.

THE PRESIDENT'S DAUGHTERS.

Including NINA. By FREDRIKA BREMER. Translated by MARY HOWITT. 3 vols. post 8vo. 31s. 6d. boards.

A NEW SKETCH OF EVERY-DAY LIFE:—

A DIARY. Together with STRIFE and PEACE. By FREDRIKA BREMER. Translated by MARY HOWITT. 2 vols. post 8vo. 21s. boards.

HOWITT. — THE RURAL LIFE OF ENGLAND.

By WILLIAM HOWITT. 3d Edition, corrected and revised, medium 8vo. with Engravings on wood, by Bewick and Williams, uniform with "Visits to Remarkable Places," 21s. cloth.

Life of the Aristocracy.

Life of the Agricultural Population. Picturesque and Moral Features of the Country. Strong Attachment of the English to Country Life.

The Forests of England.

Habits, Amusements, and Condition of the People; in which are introduced Two New Chapters, descriptive of the Rural Watering Places, and Education of the Rural Population.

HOWITT. — GERMAN EXPERIENCES :

Addressed to the English, both Goers Abroad and Stayers at Home. By WILLIAM HOWITT. fcp. 8vo. 7s. 6d. cloth.

"The minute practical information given in this book respecting Germany, and the modes of living there, will be found of great use to the English resident, who, for the purpose of education or economy, sets up his tent in that country. It is a book full of facts—facts of direct utility to the travelling English."—*COURT JOURNAL*.

HOWITT.—VISITS TO REMARKABLE PLACES:

(Old Halls, Battle-Fields, and Scenes illustrative of Striking Passages in English History and Poetry. By WILLIAM HOWITT. New Edition, medium 8vo. with 40 Illustrations by S. Williams, 21s. cloth.

SECOND SERIES, chiefly in the Counties of DURHAM and NORTHUMBERLAND, with a Stroll along the BORDER. 1 vol. medium 8vo. with upwards of 40 highly-finished Woodcuts, from Drawings made on the spot for this work, by Messrs. Carmichael, Richardsons, and Weld Taylor, 21s. cloth.

HOWITT.—THE LIFE AND ADVENTURES OF JACK OF

THE MILL, commonly called "Lord Othmill;" created, for his eminent services, Baron Waldeck, and Knight of Kitticottie; a Fireside Story.. By WILLIAM HOWITT. 2 vols. fcp. 8vo. with 46 Illustrations on Wood by G. F. Sargent, 15s. cloth.

"This agreeable story will be a great favourite with large class of juvenile readers, and will sustain the unwearying interest even of those who have passed the season of youth. The style is rare, animated, and sparkling; the story never flags, and its moral bearing is most excellent."—*ECLECTIC REVIEW*.

HOWITT.—THE RURAL AND SOCIAL LIFE OF GERMANY:

With Characteristic Sketches of its Chief Cities and Scenery. Collected in a General Tour, and during a Residence in that Country in the Years 1840-42. By WILLIAM HOWITT, Author of "The Rural Life of England," "Visits to Remarkable Places," "The Boy's Country Book," &c. Medium 8vo. with above 50 Illustrations, 21s. cloth.

HOWITT.—WANDERINGS OF A JOURNEYMAN TAILOR.

through EUROPE and the EAST, during the years 1824 to 1840. By P. D. HOLTSHAUS, from Werdohl, in Westphalia. Translated from the Third German Edition, by WILLIAM HOWITT, Author of "The Rural and Social Life of Germany," &c. &c. Fcp. 8vo. with Portrait of the Tailor, 6s. cloth.

"He has traversed Germany, Poland, Hungary, and Wallachia several times, gazed with professional delight on the varied costumes in Constantinople and Alexandria, ascended the Nile, climbed the Pyramids; dodged the Bedouins, kneeled as a pilgrim in the Holy City, stood in adoration on Mount Zion, cut a walking-stick on Mount Tabor, washed in the lake of Genesareth, slept by the side of the Dead Sea, braved the robbers of 'blest Arcady,' narrowly escaped being married at Malta by dunces who are worse than Sam Weller's andrews, and been stoned for his impertinence in attempting to enter Solomon's Mosque at Jerusalem. His descriptions of all these various places are clear and vivid, the expression of his feelings simple and natural."—*CRITIC*.

HOWITT.—THE STUDENT-LIFE OF GERMANY.

From the Unpublished MSS. of Dr. Cornhus. By WILLIAM HOWITT. 8vo. with 24 Wood-Engravings, and Seven Steel Plates, 21s. cloth.

"German student-life has, of course, its brighter side and pleasanter traits. Its generous friendships, its buoyant spirits, its noble songs, its intense study, at the last may well compensate for many of its darker features. In this volume there is no want of material to form a very sufficient notion of German student-life."—*QUARTERLY REVIEW*.

HOWITT.—COLONISATION AND CHRISTIANITY:

A Popular History of the Treatment of the Natives, in all their Colonies, by the Europeans. By WILLIAM HOWITT. Post 8vo. 10s. 6d. cloth.

HOWITT.—THE BOY'S COUNTRY BOOK:

Being the real Life of a Country Boy, written by himself; exhibiting all the Amusements, Pleasures, and Pursuits of Children in the Country. Edited by WILLIAM HOWITT, Author of "The Rural Life of England," &c. 2d Edition, fcp. 8vo. with 40 Woodcuts, 8s. cloth.

"A capital work, and, we are inclined to think, Howitt's best in any line."—*QUARTERLY REVIEW*.

HUDSON.—PLAIN DIRECTIONS FOR MAKING WILLS

In Conformity with the Law, and particularly with reference to the Act 7 Will. 4 and 1 Vict. c. 26. To which is added, a clear Exposition of the Law relating to the distribution of Personal Estate in the case of Intestacy; with two Forms of Wills, and much useful information, &c. By J. C. HUDSON, of the Legacy Duty Office, London. 12th Edition, corrected, with notes of cases judicially decided since the above Act came into operation. Fcp. 8vo. 2s. 6d.

HUDSON.—THE EXECUTOR'S GUIDE.

By J. C. HUDSON. Third Edition, fcp. 8vo. 5s. cloth.

"* These two works may be had in 1 volume, 7s. cloth."

HUDSON.—THE PARENT'S HAND-BOOK:

Or, Guide to the Choice of Professions, Employments, and Situations; containing useful and practical Information on the subject of placing out Young Men, and of obtaining their Education with a view to particular occupations. By J. C. HUDSON, Esq. Author of "Plain Directions for Making Wills." Fcp. 8vo. 5s. cloth.

HUDSON.—RESEARCHES ON LIGHT:

An Examination of all the Phenomena connected with the Chemical and Molecular Changes produced by the Influence of the Solar Rays, embracing all the known Photographic Processes, and new Discoveries in the Art. By ROBERT HUNT, Secretary of the Royal Cornwall Polytechnic Society. 8vo. with Plate and Woodcuts, 10s. 6d. cloth.

"Mr Hunt's reputation is so well established, that we need only mention his pleasing volume to secure it a favourable reception from the philosophical public."—*JAMIESON'S NEW EDINBURGH PHILOSOPHICAL JOURNAL*.

HUMPHREYS.—THE ILLUMINATED BOOKS OF THE

MIDDLE AGES.—A History of Illuminated Books, from the 14th to the 17th Century. By HENRY NOEL HUMPHREYS. Illustrated by a Series of Specimens, consisting of an entire Page, of the exact Size of the Original, from the most celebrated and splendid MSS. in the Imperial and Royal Libraries of Vienna, Moscow, Paris, Naples, Copenhagen, and Madrid;—from the Vatican, Escorial, Ambrosian, and other great Libraries of the Continent;—and from the rich Public, Collegiate, and Private Libraries of Great Britain; superbly printed in Gold, Silver, and Colours.

In course of publication, in Parts, issued at intervals of about two months; each Part to contain Three Plates, of the exact size of the original subjects, and each Plate accompanied by a description, with some account of the MS. from which it is taken. The last Part to contain an Historical Sketch of the Progress of the Art of Illumination, with a Table for placing the Plates in Chronological Order,—as, in the Parts, they will, for the sake of variety and convenience, be issued without regard to their Chronological arrangement.

Each Part, containing Three Plates, with Descriptions, Imperial Quarto (15 in. by 11), splendidly printed, in gold, silver, and colours, in imitation of the originals, as accurate as can be produced, by mechanical means, 12s.

LARGE PAPER, on Half Imperial (21½ in. by 15), to prevent folding the large Plates, 21s.

Six Parts to form a Volume, Four Volumes completing the work.

PLATES CONTAINED IN THE FIRST PART.

1. Page from a large and beautiful MS. executed for Edward IV. containing Portraits of himself, and his brothers Gloucester and Clarence.
2. Page from a rich MS. of the Orations of Demosthenes, made for one of the Farnesi.
3. A remarkable Frontispiece, of great beauty, from a Venetian Diploma.

"We have seen some specimens of a proposed work by Mr. Humphreys, on Illuminated MSS. which have surprised us by the accuracy of their execution, and the effect produced by merely mechanical means."—*QUARTERLY REVIEW*

HUNTER.—THE RISE OF THE OLD DISSENT

Exemplified in the LIFE OF OLIVER HEYWOOD: with a Sketch of the subsequent History of the English Presbyterian Dissenters. By the Rev. JOSEPH HUNTER, F.S.A. 8vo. 7s. cloth.

JACKSON.—PICTORIAL FLORA;

Or, British Botany delineated, in 1500 Lithographic Drawings of all the Species of Flowering Plants indigenous to Great Britain; illustrating the descriptive works on English Botany of Hooker, Lindley, Smith, &c. By MISS JACKSON. 8vo 15s. cloth.

JAMES.—LIVES OF MOST EMINENT FOREIGN STATESMEN.

By G. P. R. JAMES, Esq., and E. E. CROWE, Esq. 5 vols. fcp. 8vo. Vignette Titles, 30s. cloth.

JAMES.—A HISTORY OF THE LIFE OF EDWARD THE

BLACK PRINCE, and of various Events connected therewith, which occurred during the Reign of Edward III. King of England. By G. P. R. JAMES, Esq. 2d Edition, 2 vols. fcp. 8vo. Map, 15s. cloth.

JEFFREY.—CONTRIBUTIONS TO THE EDINBURGH

REVIEW. By FRANCIS JEFFREY, now one of the Judges of the Court of Session in Scotland. 4 vols. 8vo. 48s. cloth.

JOHNSON.—THE FARMER'S ENCYCLOPÆDIA,

And Dictionary of Rural Affairs: embracing all the recent Discoveries in Agricultural Chemistry; adapted to the comprehension of unscientific readers. By CUTHBERT W. JOHNSON, Esq. F.R.S. Barrister-at-Law, Corresponding Member of the Agricultural Society of Königsberg, and of the Maryland Horticultural Society; Author of several of the Prize Essays of the Royal Agricultural Society of England, and other Agricultural Works; Editor of the "Farmer's Almanack," &c. 1 thick vol. 8vo. illustrated by Wood Engravings of the best and most improved Agricultural Implements, &c. 2. 10s. cloth.

"Cuthbert Johnson's 'Farmer's Encyclopædia' is one of the best books of its class." Dr. Landley, in *THE GARDENER'S CHRONICLE*.

KANE.—ELEMENTS OF CHEMISTRY;

Including the most Recent Discoveries and Applications of the Science to Medicine and Pharmacy, and to the Arts. By ROBERT KANE, M.D. M.R.I.A., Professor of Natural Philosophy to the Royal Dublin Society. 1 thick volume, 8vo. with 236 Woodcuts, 24s. cloth.

KANE.—THE INDUSTRIAL RESOURCES OF IRELAND.

By ROBERT KANE, M.D. Secretary to the Council of the Royal Irish Academy, Professor of Natural Philosophy to the Royal Dublin Society, and of Chemistry to the Apothecaries' Hall of Ireland. Post 8vo. 7s. cloth.

"We have been much struck by a work recently published, by Professor Kane, on the 'Industrial Resources of Ireland.' The volume contains a masterly view of the physical materials upon which Irish industry might work. The fuel, the water-power, the minerals, the composition and capabilities of the soil, the nature and locality of minerals, and the means of internal communication existing in the country, are successively taken up, analysed, and laid before the reader, in their scientific as well as in their practical bearings. Nothing can leave a stronger impression of the mismanagement from which Ireland has suffered than Dr. Kane's clear and business-like statement of the elements of wealth and power which have so long lain almost idle in her possession."—*MORNING CHRONICLE*.

KATER AND LARDNER.—A TREATISE ON MECHANICS.

By Captain KATER and Dr. LARDNER. New Edition. 1 vol. fcp. 8vo. Vignette Title, and 19 Plates, comprising 224 distinct figures, 6s. cloth.

KEIGHTLEY.—OUTLINES OF HISTORY,

From the Earliest Period. By THOMAS KEIGHTLEY, Esq. New Edition, corrected and considerably improved, fcp. 8vo. 6s. cloth; or 6s. 6d. bound.

KING. — A SELECTION FROM THE SPEECHES AND WRITINGS of the late LORD KING. With a short Introductory Memoir, by EARL FORTESCUE. Demy 8vo. Portrait, 12s. cloth.

"A judicious and interesting selection from the speeches and writings of a nobleman who, by ability, consistency, and honesty of purpose, displayed throughout the course of a long public life, deserved to live in the remembrance of his countrymen; interesting, also, as a memorial of one of the earliest champions of those principles which now receive general homage, and an useful contribution to the political history of the first thirty years of the present century. The introductory memoir is distinguished by good feeling and good taste, and is chargeable only with the uncommon fault of being too short."—*MORNING CHRONICLE*.

KIPPIS.—A COLLECTION OF HYMNS AND PSALMS,

For Public and Private Worship. Selected and prepared by A. KIPPIS, D.D., ABRAHAM REES, D.D., the Rev. THOMAS JERVIS, and the Rev. T. MORGAN. To which is added, a SUPPLEMENT. New Edition, corrected and improved, 18mo. 5s. bound.

KIRBY & SPENCE.—AN INTRODUCTION TO ENTOMOLOGY;

Or, Elements of the Natural History of Insects: comprising an account of noxious and useful Insects, of their Metamorphoses, Food, Stratagems, Habitations, Societies, Motions, Noises, Hybernation, Instinct, &c. By W. KIRBY, M.A. F.R.S. & L.S. Rector of Barham; and W. SPENCE, Esq. F.R.S. & L.S. 6th Edit. corrected and much enlarged, 2 vols. 8vo. 31s. 6d. cloth.

The first two volumes of the "Introduction to Entomology" are published as a separate work, distinct from the third and fourth volumes, and, though much enlarged, at a considerable reduction of price, in order that the numerous class of readers who confine their study of insects to that of their manners and economy, need not be burthened with the cost of the technical portion of the work, relating to their anatomy, physiology, &c.

KNAPP.—GRAMINA BRITANNICA;

Or, Representations of the British Grasses: with Remarks and occasional Descriptions. By I. L. KNAPP, Esq. F.L.S. & A.S. 2d Edition, 4to. with 118 Plates, beautifully coloured, pp 250, £3. 16s. boards.

"Most of the persons interested in the art of distinguishing grasses are country gentlemen and farmers, who know nothing of botany, and cannot use the technical descriptions or analytical figures of botanists. To that great class such a book is invaluable. It ought, in fact, to form part of the library of every one interested in rural affairs, for there are few plants so difficult to distinguish as grasses, not any more so, and none which it is more important to know correctly, because of their various uses and qualities. With Mr Knapp's book before him, no one can have the least difficulty in making himself master of the subject."—*GARDENERS' CHRONICLE*.

LAING, (S., JUN.)—NATIONAL DISTRESS:

Its Causes and Remedies. By SAMUEL LAING, Jun Esq. late Fellow of St. John's College, Cambridge. 8vo. 7s. 6d. cloth.

. The Essay to which the First Prize of £100, offered by *The Atlas* newspaper, was awarded.

LAING.—THE CHRONICLE OF THE KINGS OF NORWAY,

From the Earliest Period of the History of the Northern Sea Kings to the Middle of the Twelfth Century, commonly called *The Heimskringla*. Translated from the Icelandic of Snorro Sturleson, with Notes, and a Preliminary Discourse, by SAMUEL LAING, Author of "Notes of a Traveller," &c. 3 vols. 8vo. 36s. cloth.

"We have been rather profuse in our extracts from this curious and most characteristic old history. But it is long since we have met with a work so spirited, and so amusing, and at the same time affording such valuable information respecting a race to whom we are so largely indebted, as this venerable Chronicle of Snorro Sturleson."—*THE REVIEW*.

LAING.—JOURNAL OF A RESIDENCE IN NORWAY,

During the years 1834, 1835, and 1836; made with a view to inquire into the Rural and Political Economy of that Country, and the Condition of its Inhabitants. By SAMUEL LAING, Esq. 2d Edition, 8vo. 14s. cloth.

LAING.—NOTES OF A TRAVELLER,

On the Social and Political State of France, Prussia, Switzerland, Italy, and other parts of Europe, during the present century. By SAMUEL LAING, Esq. 2d Edition, 8vo. 16s. cloth.

LAING.—A TOUR IN SWEDEN,

In 1838; comprising observations on the Moral, Political, and Economical State of the Swedish Nation. By SAMUEL LAING, Esq. 8vo. 12s. cloth.

LARDNER'S CABINET CYCLOPÆDIA;

Comprising a Series of Original Works on History, Biography, Literature, the Sciences, Arts, and Manufactures. Conducted and edited by Dr. LARDNER.

The Series, complete, in One Hundred and Thirty-three Volumes, £39. 18s. (One volume only remains to be published.) The works, separate, 6s. per volume.

"In the completeness of its treatises, the Cabinet Cyclopædia is unrivalled; and now that the whole plan is carried out, it exhibits an extensive body of available knowledge such as this or no other country has ever yet presented in a popular and convenient form."—*BRITANNIA*.

LARDNER AND WALKER.—A TREATISE ON ELECTRICITY,

MAGNETISM, and METEOROLOGY. By D. LARDNER, LL.D. F.R.S., and C. V. WALKER, Secretary of the Electrical Society. 2 vols. fcp. 8vo. 12s.

LARDNER.—A TREATISE ON ARITHMETIC.

By D. LARDNER, LL.D. F.R.S. 1 vol. fcp. 8vo. with Vignette Title, 6s. cloth lettered.

LARDNER.—A TREATISE ON GEOMETRY,

And its Application to the Arts. By Dr. LARDNER. 1 vol. fcp. 8vo. Vignette Title, and upwards of 200 figures, 6s. cloth.

LARDNER.—A TREATISE ON HEAT.

By D. LARDNER, LL.D., &c. 1 vol. fcp. 8vo. with Woodcuts and Vignette Title, 6s. cloth.

LARDNER.—A TREATISE ON HYDROSTATICS AND PNEUMATICS.

By Dr. LARDNER. New Edition. 1 vol. fcp. 8vo. 6s. cloth.

LECTURES ON POLARISED LIGHT,

Delivered before the Pharmaceutical Society, and in the Medical School of the London Hospital. 8vo. illustrated by above 50 Woodcuts, 5s. 6d. cloth.

L. E. L.—THE POETICAL WORKS OF LETITIA ELIZABETH

LONDON. New Edition (1839), 4 vols. fcp. 8vo. with Illustrations by Howard, &c. 28s. cloth lettered; or handsomely bound in morocco, with gilt edges, £2. 4s.

The following may be had separately:—

THE IMPROVISATRICE..... 10s. 6d. | THE GOLDEN VIOLET 10s. 6d.
THE VENETIAN BRACELET .. 10s. 6d. | THE TROUBADOUR 10s. 6d.

LEE.—TAXIDERMY;

Or, the Art of Collecting, Preparing, and Mounting Objects of Natural History. For the use of Museums and Travellers. By Mrs. R. LEE (formerly Mrs. T. E. Bowdich), Author of "Memoirs of Cuvier," &c. 6th Edition, improved, with an account of a Visit to Walton Hall, and Mr. Waterton's method of Preserving Animals. Fcp. 8vo. with Wood Engravings, 7s. cloth.

LEE.—ELEMENTS OF NATURAL HISTORY,

For the use of Schools and Young Persons: comprising the Principles of Classification, interspersed with amusing and instructive original Accounts of the most remarkable Animals. By Mrs. R. LEE (formerly Mrs. T. E. Bowdich), Author of "Taxidermy," "Memoirs of Cuvier," &c. 12mo. with Fifty-five Woodcuts, 7s. 6d. bound.

LIFE OF A TRAVELLING PHYSICIAN.

From his first Introduction to Practice; including 20 Years' Wanderings throughout the greater part of Europe. 3 vols. post8vo. 3 coloured Plates, 31s. 6d. cloth.

"Really a very clever book, full of amusing and interesting matter, and giving unequivocal evidence of the author's talent for observation, both of men and manners, as well as a happy facility of graphically delineating what he sees."—BRITISH AND FOREIGN MEDICAL REVIEW.

LINDLEY.—INTRODUCTION TO BOTANY.

By Prof. J. LINDLEY, Ph.D. F.R.S. L.S. &c. 3d Edition (1839), with Corrections and considerable Additions, 1 large vol. 8vo. pp. 606, with Six Plates and numerous Woodcuts, 18s. cloth.

LINDLEY.—FLORA MEDICA;

A Botanical Account of all the most important Plants used in Medicine, in different Parts of the World. By JOHN LINDLEY, Ph.D., F.R.S., &c. 1 vol. 8vo. 18s. cloth lettered.

LINDLEY.—A SYNOPSIS OF THE BRITISH FLORA,

Arranged according to the Natural Orders. By Professor JOHN LINDLEY, Ph.D., F.R.S., &c. 3d Edit. with numerous additions, corrections, and improvements, 12mo. pp. 390, 10s. 6d. cl.

LINDLEY.—THE THEORY OF HORTICULTURE;

Or, an Attempt to explain the Principal Operations of Gardening upon Physiological Principles. By JOHN LINDLEY, Ph.D., F.R.S. 8vo. Illustrations on Wood. 12s. cloth.

"This book is written in the hope of providing the intelligent gardener, and the scientific amateur, correctly, with the rationale of the more important operations of Horticulture. and the author has endeavoured to present to his readers an intelligible explanation, founded upon well ascertained facts, which they can judge of by their own means of observation, of the general nature of vegetable actions, and of the causes which, while they control the powers of life in plants, are capable of being regulated by themselves. The possession of such knowledge will necessarily teach them how to improve their methods of cultivation, and lead them to the discovery of new and better modes."

LINDLEY.—AN OUTLINE OF THE FIRST PRINCIPLES OF

HORTICULTURE. By PROFESSOR LINDLEY. 18mo. 2s. sewed.

LINDLEY.—GUIDE TO ORCHARD AND KITCHEN GARDEN;

Or, an Account of the most valuable Fruits and Vegetables cultivated in Great Britain: with Calendars of the Work required in the Orchard and Kitchen Garden during every month in the year. By G. LINDLEY C.M.H.S. Edited by Prof LINDLEY. 1 large vol. 8vo. 16s. bds.

LLOYD.—A TREATISE ON LIGHT AND VISION.

By the Rev. H. LLOYD, M.A., Fellow of Trin. Coll. Dublin. 8vo. 15s. boards.

LORIMER.—LETTERS TO A YOUNG MASTER MARINER,

On some Subjects connected with his Calling. By CHARLES LORIMER. 3d edition, 12mo. with an Appendix, 5s. 6d. cloth.

LOUDON (MRS.)—THE LADY'S COUNTRY COMPANION;
Or, How to Enjoy a Country Life Rationally. By Mrs. Loudon, Author of "Gardening for Ladies," &c.

CONTENTS.—Introduction—The House—The Garden—Domestic Animals—Rural Walks—Miscellaneous Country Amusements—Country Duties. [In the press.]

LOUDON.—AN ENCYCLOPÆDIA OF TREES AND SHRUBS;
being the "Arboretum et Fruticetum Britannicum" abridged: containing the Hardy Trees and Shrubs of Great Britain, Native and Foreign, Scientifically and Popularly Described; with their Propagation, Culture, and Uses in the Arts; and with Engravings of nearly all the Species. Adapted for the use of Nurserymen, Gardeners, and Foresters. By J. C. Loudon, F.L.S. &c. 8vo. pp. 1234, 2000 Engravings on Wood, £2. 10s. bound in cloth.

The Original Work may be had in 8 vols. 8vo. with above 400 Octavo Plates of Trees, and upwards of 2500 Woodcuts, £10, cloth.

LOUDON.—AN ENCYCLOPÆDIA OF GARDENING;

Presenting, in one systematic view, the History and Present State of Gardening in all Countries, and its Theory and Practice in Great Britain: with the Management of the Kitchen Garden, the Flower Garden, Laying-out Grounds, &c. By J. C. Loudon, F.L.S. &c. A New Edition, enlarged and much improved, 1 large vol. 8vo. with nearly 1,000 Engravings on Wood, pp. 1312, 50s. cloth.

LOUDON.—AN ENCYCLOPÆDIA OF AGRICULTURE;

Comprising the Theory and Practice of the Valuation, Transfer, Laying-out, Improvement, and Management of Landed Property, and of the Cultivation and Economy of the Animal and Vegetable productions of Agriculture: including all the latest Improvements, a general History of Agriculture in all Countries, a Statistical View of its present State, with Suggestions for its future progress in the British Isles; and Supplement, bringing down the work to the year 1844. By J. C. Loudon, F.L.G.Z. and H.S. &c. 5th Edition, illustrated with upwards of 1100 Engravings on Wood, by Branstons, £2. 10s. cloth.

The SUPPLEMENT, bringing down Improvements in the art of Field-Culture from 1831 to 1844 inclusive, comprising all the previous Supplements, and illustrated with 65 Engravings on Wood, may be had *separately*, 5s. sewed.

"To know that this Supplement is by the author of the justly-popular Encyclopædias of Agriculture and Gardening, is a sufficient recommendation for its general excellence. Independently of Mr. Loudon's long practical experience, every rational authority on agriculture, and works on other sciences in connection with it, have been consulted, and the result is, one of the most valuable works on rural affairs either in our own or in any other language."—*BRITISH FARMER'S MAGAZINE*.

LOUDON.—AN ENCYCLOPÆDIA OF PLANTS;

Including all the Plants which are now found in, or have been introduced into, Great Britain; giving their Natural History, accompanied by such descriptions, engraved figures, and elementary details, as may enable a beginner, who is a mere English reader, to discover the name of every Plant which he may find in flower, and acquire all the information respecting it which is useful and interesting. The Specific Characters by an Eminent Botanist; the Drawings by J. D. C. Sowerby, F.L.S. A New Edition, with New Supplement, comprising every desirable particular respecting all the Plants originated in, or introduced into, Britain between the first publication of the work, in 1829, and January 1840: with a new General Index to the whole work. Edited by J. C. Loudon, prepared by W. H. Baxter, Jun. and revised by George Don, F.L.S.; and 800 new Figures of Plants on Wood, from Drawings by J. D. C. Sowerby, F.L.S. One very large vol. 8vo. with nearly 10,000 Wood Engravings, £3. 13s. 6d.

The last Supplement, *separately*, 8vo. pp. 190, 15s. cloth.

LOUDON.—AN ENCYCLOPÆDIA OF COTTAGE, FARM, AND

VILLA ARCHITECTURE AND FURNITURE. Containing Designs for Cottages, Villas, Farm Houses, Farmhouses, Country Inns, Public Houses, Parochial Schools, &c.; with the requisite Fittings-up, Fixtures, and Furniture, and appropriate Offices, Gardens, and Garden Scenery: each Design accompanied by Analytical and Critical Remarks illustrative of the Principles of Architectural Science and Taste on which it is composed, and General Estimates of the Expense. By J. C. Loudon, F.L.S. &c. New Edition (1842), corrected, with a Supplement, containing 160 additional pages of letter-press and nearly 300 new engravings, bringing down the work to 1842. 1 very thick vol. 8vo. with more than 3000 Engravings on Wood, £3. 3s. cloth.

The Supplement, *separately*, 8vo. 7s. 6d. sewed.

"The late Mr. Loudon has the merit of having conveyed more information upon architecture in a popular style, as adapted for general readers, than was ever attempted before, or than has been accomplished since. His Encyclopædia of Cottage and Village Architecture is indispensable to the library of all non-professional readers, who may at some time of their life propose to build a cottage or country house."—*WESTMINSTER REVIEW*.

LOUDON.—HORTUS BRITANNICUS:

A Catalogue of all the Plants indigenous to or introduced into Britain. The 3d Edition (1832), with a NEW SUPPLEMENT, prepared, under the direction of J. C. Loudon, by W. H. Baxter, and revised by GEORGE DON, F.L.S. 1 vol. 8vo. 31s. 6d. cloth.

The SUPPLEMENT (1835) *separately*, 8vo. 2s. 6d. sewed.

The LATER SUPPLEMENT (1836) *separately*, 8vo. 8s. sewed.

LOUDON.—HORTUS LIGNOSIS LONDINENSIS;

Or, a Catalogue of all the Ligneous Plants cultivated in the neighbourhood of London. To which are added their usual prices in Nurseries. By J. C. Loudon, F.L.S. &c. 8vo. 7s. 6d.

LOUDON.—THE SUBURBAN GARDENER AND VILLA

COMPANION: comprising the Choice of a Villa or Suburban Residence, or of a situation on which to form one; the Arrangement and Furnishing of the House; and the Laying-out, Planting, and general Management of the Garden and Grounds; the whole adapted for grounds from one perch to fifty acres and upwards in extent; intended for the instruction of those who know little of Gardening or Rural Affairs, and more particularly for the use of Ladies. By J. C. LOUDON, F.L.S. &c. 1 vol. 8vo. with above 300 Wood Engravings, 20s. cloth.

LOUDON.—ON THE LAYING-OUT, PLANTING, AND

MANAGEMENT OF CEMETERIES; and on the Improvement of Churchyards. By J. C. LOUDON, F.L.S. &c. 8vo. with 60 Engravings, 12s. cloth.

"In 1813, Mr. Loudon was at Warsaw after the battle of Bautzen; and was so strongly impressed by the contrast between the burials of the rich in the cemetery, the poor in trenches in the open ground without coffins, and cart-loads of dead soldiers from the hospitals thrown into great pits, as to have ever since directed his attention to burials and burial grounds. Having been lately employed to plan the Cambridge Cemetery, he was compelled to give his views a definite and practical shape. The result is the volume before us; which, like most other works of Mr. Loudon, exhausts the subject on which it treats, presenting the principles as well as the practice, in a full and popular form. To shareholders of cemeteries and others having a practical connexion with the improvement of interments, the book is almost necessary; nor will it be without interest to any one whose hobby ambles towards the mournful subject."—SPECTATOR.

LOW.—ON LANDED PROPERTY, AND THE MANAGEMENT

of **ESTATES;** comprehending the Relations between Landlord and Tenant, and the Principles and Forms of Leases; the Construction of Farm-buildings, Enclosures, Drains, Embankments, and other Works; and the Economy of Woods, Mines, &c. By DAVID LOW, F.R.S.E. &c. 8vo. *[In the press.]*

LOW. THE BREEDS OF THE DOMESTICATED ANIMALS

Of Great Britain Described. By DAVID LOW, Esq. F.R.S.E. Professor of Agriculture in the University of Edinburgh; Member of the Royal Academy of Agriculture of Sweden; Corresponding Member of the Conseil Royal d'Agriculture de France, of the Société Royale et Centrale, &c. &c. The Plates from Drawings by W. Nicholson, R.S.A. reduced from a Series of Oil Paintings, executed for the Agricultural Museum of the University of Edinburgh, by W. Shiels, R.S.A. 2 vols. atlas quarto, with 56 plates of animals, beautifully coloured after Nature, £16. 16s. half-bound in morocco.—Or in four separate portions, as follow:

The OX, in 1 vol. atlas quarto, with 22 plates, £6. 16s. 6d. half-bound in morocco.

The SHEEP, in 1 vol. atlas quarto, with 21 plates, £6. 16s. 6d. half-bound in morocco.

The HORSE, in 1 vol. atlas quarto, with 8 plates, £3. half-bound in morocco.

The HOG, in 1 vol. atlas quarto, with 5 plates, £2. 2s. half-bound in morocco.

LOW.—AN INQUIRY INTO THE NATURE OF THE SIMPLE

BODIES OF CHEMISTRY. By DAVID LOW, Esq. F.R.S.E., Prof. of Agriculture in the University of Edinburgh. 8vo. 6s. cloth.

LOW.—ELEMENTS OF PRACTICAL AGRICULTURE;

Comprehending the Cultivation of Plants, the Husbandry of the Domestic Animals, and the Economy of the Farm. By D. Low, Esq. F.R.S.E., Prof. of Agriculture in University of Edinburgh. 8vo. 4th Edit. with Alterations and Additions, and above 200 Woodcuts, 21s. cloth.

MACAULAY.—CRITICAL AND HISTORICAL ESSAYS CON-

TRIBUTED TO THE EDINBURGH REVIEW. By the Right Hon. THOMAS BABINGTON MACAULAY. 3d Edition, 3 vols. 8vo. 36s. cloth.

MACAULAY.—LAYS OF ANCIENT ROME.

By T. B. MACAULAY, Esq. 5th Edition, crown 8vo. 10s. 6d. cloth.

MACKENZIE.—THE PHYSIOLOGY OF VISION.

By W. MACKENZIE, M.D., Lecturer on the Eye in the University of Glasgow. 8vo. with Woodcuts, 10s. 6d. boards.

MACKINTOSH (SIR JAMES).—SIR JAMES MACKINTOSH'S

MISCELLANEOUS WORKS; including his Contributions to "The Edinburgh Review." Collected and edited by his Son. 3 vols. 8vo. *[In the press.]*

MACKINTOSH, &c.—THE HISTORY OF ENGLAND.

By SIR JAMES MACKINTOSH; W. WALLACE, Esq.; and ROBERT BELL, Esq. 10 vols. fcp. 8vo. with Vignette Titles, £3. cloth.

MACLEOD.—ON RHEUMATISM,

and on the Affections of Internal Organs, more especially the Heart and Brain, to which it gives rise. By R. MACLEOD, M.D. Physician to St. George's Hospital. 8vo. pp. 172, 7s. cloth.

M'CULLOCH.—A DICTIONARY, GEOGRAPHICAL, STATIS-

TICAL, AND HISTORICAL, of the various Countries, Places, and Principal Natural Objects in the WORLD. By J. R. M'CULLOCH, Esq. 2 thick vols. 8vo. Illustrated with Six Large important Maps. £4. cloth.

"The extent of information this Dictionary affords on the subjects referred to in its title is truly surprising. It cannot fail to prove a valuable resource to the student, whose inquiries will be guided by its light, and satisfied by its clear and frequently elaborated communications. Every public room in which commerce, politics, or literature, forms the subject of discussion, ought to be furnished with these volumes."—GLEANER.

M'CULLOCH.—A DICTIONARY, PRACTICAL, THEORETICAL, AND HISTORICAL, OF COMMERCE AND COMMERCIAL NAVIGATION. Illustrated with Maps and Plans. By J. R. M'CULLOCH, Esq. Member of the Institute of France. An entirely New Edition, corrected throughout, enlarged, and improved. One thick vol. 8vo. 50s. cloth; or 55s. strongly half-bound in Russia, with flexible backs.

"Without exaggeration one of the most wonderful compilations of the age. The power of continuous labour, the wide range of inquiry, and the power of artistical finish, which have been brought into play by this work, are probably unrivalled in the history of literature. Compared with all previous attempts to compile a commercial dictionary, Mr. M'Culloch's appears as the realisation of an idea which former projectors had conceived too vaguely to be able to carry into execution. It is superior to them all, quite as much for the spirit of judicious selection brought by the author to his task, as for any other quality. The great merit of the work is, that, while omitting nothing of essential importance, it contains nothing that is useless or merely cumbrous. . . . The success of the earlier editions of Mr. M'Culloch's Dictionary is, after all, the best proof of its merit: the facts attending it, prove that the mercantile, political, and literary public were in want of such a work, and that they were satisfied with the manner in which Mr. M'Culloch had performed his task. No reader can eruse from the perusal of any one of the larger articles without feeling that no previous writer has concentrated so much valuable information within so small a compass, or conveyed his information in so agreeable a style. . . . And the remark is equally applicable to all the numerous articles of which this crammed volume is composed. . . . It is, indeed, invaluable as a book of reference to the merchant, the insurance-agent, the statesman, and the journalist, and its articles, from the care and talent with which they are executed, are as well calculated to supply the wants of the patient inquirer as of the hurried man of business. Mr. M'Culloch occupies a high place amongst the authors of the day as a hard-headed original thinker in political economy, a still higher, as one of the most zealous and successful labourers in rendering that science popular; but, of all his publications, his Commercial Dictionary is the one least likely to encounter the rivalry of a work of superior or even equal value."—*Abridged from THE SPECTATOR of March 16, 1844.*

M'CULLOCH.—THE PRINCIPLES OF POLITICAL ECONOMY: with some Enquiries respecting their Application, and a Sketch of the Rise and Progress of the Science. By J. R. M'CULLOCH, Esq. New Edition, enlarged and corrected, 8vo. 15s.

MALTE-BRUN.—A SYSTEM OF UNIVERSAL GEOGRAPHY, Founded on the Works of MALTE-BRUN and BALBI, embracing an Historical Sketch of the Progress of Geographical Discovery, the Principles of Mathematical and Physical Geography, and a complete Description, from the most recent sources, of the Political and Social Condition of all the Countries in the World: with numerous Statistical Tables, and an Alphabetical Index of 12,000 Names. One thick vol. 8vo. closely and beautifully printed, 29s. cloth.

MARCEY.—CONVERSATIONS ON CHEMISTRY;

In which the Elements of that Science are familiarly Explained and Illustrated by Experiments. 14th Edition, enlarged and corrected, 2 vols. fcp. 8vo. 14s. cloth.

MARCEY.—CONVERSATIONS ON NATURAL PHILOSOPHY;

In which the Elements of that Science are familiarly explained, and adapted to the comprehension of Young Persons. 10th Edition, enlarged and corrected by the Author, fcp. 8vo. with 23 Plates, 10s. 6d. cloth.

(Of the General Properties of Bodies; the Attraction of Gravity; the Laws of Motion; Compound Motion; the Mechanical Powers; Astronomy; Causes of the Earth's Motion; the Planets; the Earth; the Moon; Hydrostatics; the Mechanical Properties of Fluids; of Springs, Fountains, &c.; Pneumatics; the Mechanical Properties of Air; on Wind and Sound; Optics; the Visual Angle and the Reflection of Mirrors; on Refraction and Colours; on the Structure of the Eye, and Optical Instruments.

MARCEY.—CONVERSATIONS ON POLITICAL ECONOMY;

In which the Elements of that Science are familiarly explained. 7th Edition (1839), revised and enlarged, fcp. 8vo. 7s. 6d. cloth.

Introduction; on Property; the Division of Labour; on Capital; on Wages and Population; on the Condition of the Poor; on Value and Price; on Income; Income from Landed Property; Income from the Cultivation of Land; Income from Capital lent; on Money; on Commerce; on Foreign Trade; on Expenditure and Consumption.

MARCEY.—CONVERSATIONS ON VEGETABLE PHYSIOLOGY; comprehending the Elements of Botany, with their application to Agriculture. 3d Edition, fcp. 8vo. with 4 Plates, 9s. cloth.

Introduction; on Roots; on Stems; on Leaves; on Sap; on Cambium and the peculiar Juices of Plants; on the Action of Light and Heat on Plants; on the Naturalization of Plants; on the Action of the Atmosphere on Plants; on the Action of Water on Plants; on the Artificial Mode of Watering Plants; on the Action of the Soil on Plants; on the Propagation of Plants by Subdivision; on Grafting; on the Multiplication of Plants by Seed; the Flower; on Compound Flowers; on Fruit; on the Seed; on the Classification of Plants; on Artificial Systems; on the Natural System; Botanical Geography; the Influence of Culture on Vegetation; on the Degeneration and Diseases of Plants; on the Cultivation of Trees; on the Cultivation of Plants which produce Fermented Liquors; on the Cultivation of Grasses, Tuberos Roots, and Grain; on Oleaginous Plants and Culinary Vegetables.

MARCEY.—CONVERSATIONS FOR CHILDREN;

On Land and Water. 2d Edition, revised and corrected, fcp. 8vo. with coloured Maps, showing the comparative altitude of Mountains, 5s. 6d. cloth.

"This is so far superior to the usual class of modern books, in which it is thought necessary to give instruction a garnish of amusement, that we cannot omit to recommend it here."—*QUARTERLY REVIEW.*

MAR CET.—CONVERSATIONS ON LANGUAGE,

For Children. By Mrs. MARCET, Author of "Mary's Grammar," "Conversations on Chemistry," &c. 18mo. 4s. 6d. cloth.

"In these Conversations Mrs. Marcet travels over a great deal of ground, with her wonted skill in adapting knowledge to the capacity of the young. The nature of articulate sounds, and the organs of speech, the history of mankind to indicate the formation of different languages, the manner in which English has been indebted to Latin, the probable or possible origin of language, and the use of cognomens and names, are all familiarly displayed in this instructive little volume."—SPECTATOR.

MAR CET.—MARY'S GRAMMAR;

Interspersed with Stories, and intended for the Use of Children. 7th Edition, revised and enlarged. 18mo. 3s. 6d. half-bound.

"A sound and simple work for the earliest ages."—QUARTERLY REVIEW.

MAR CET.—THE GAME OF GRAMMAR,

With a Book of Conversations shewing the Rules of the Game, and affording Examples of the manner of playing at it. In a varnished box, or done up as a post 8vo. volume in cloth, 8s.

MAR CET.—LESSONS ON ANIMALS, VEGETABLES, AND MINERALS.

By Mrs. MARCET, Author of "Conversations on Chemistry," &c. 12mo. 2s.

"One of Mrs. Marcet's carefully-written books of instruction, in which natural history is made pleasant and intelligible for the young."—ATHENÆUM.

MAR CET.—CONVERSATIONS ON THE HISTORY OF ENGLAND, for the Use of Children.

By Mrs. MARCET, Author of "Conversations on Chemistry," &c. 2d Edition, with Additions, continuing the History to the Reign of George the Third, 18mo 5s. cloth.

The Second Part, continuing the History to the Reign of George III. separately, 1s. 6d. cloth.

"Juvenile literature will freely own how much it is indebted to Mrs. Marcet, not only for the present, but all her preceding works. She unparts interest to dry and dull details, and, while she teaches, begets a desire to her pupils for further knowledge, so pleasantly imparted. These 'Conversations' admirably suited to the capacities of children, may be skimmed advantageously by children of a larger growth."—LITERARY GAZETTE.

MARRIAGE GIFT.

By a MOTHER. A Legacy to her Children. Post 8vo. 5s. cloth, gilt edges.

MARRYAT.—THE SETTLERS IN CANADA.

Written for Young People. By Capt. MARRYAT, C.B. Author of "Peter Simple," "Masterman Ready," &c. 2 vols. fcp. 8vo. 12s. boards.

MARRYAT.—MASTERMAN READY;

Or, the Wreck of the Pacific. Written for Young People. By CAPTAIN MARRYAT. 3 vols. fcp. 8vo. with numerous Engravings on Wood, 22s. 6d. cloth.

s The volumes *separately*, 7s. 6d. each, cloth.

"The best of Robinson Crusoe's numerous descendants, and one of the most captivating of modern children's books. The only danger is, lest parents should dispute with their children the possession of it."—QUARTERLY REVIEW.

MARX AND WILLIS.—ON THE DECREASE OF DISEASE

effected by the Progress of Civilization. By C. F. H. MARX, M.D. Professor of Medicine in the University of Göttingen, &c.; and R. WILLIS, M.D. Member of the Royal College of Physicians, &c. Fcp. 8vo. 4s. cloth.

"This little treatise, although evidently designed for professional perusal, is perfectly intelligible to the educated reader, and right glad shall we be to see it extensively circulated out of the profession, it is a work which does such credit to the hearts and the heads of its authors."—LANCET.

MAUNDER.—THE TREASURY OF HISTORY;

Comprising a General Introductory Outline of Universal History, Ancient and Modern, and a Series of separate Histories of every principal Nation that exists; their Rise, Progress, and Present Condition, the Moral and Social Character of their respective inhabitants, their Religion, Manners, and Customs, &c. By SAMUEL MAUNDER. 1 thick vol. fcp. 8vo. 10s. cloth; bound in roan, 12s.

"An encyclopedia of history in miniature—some hundreds of volumes compressed into one. The author first gives a general sketch of ancient and modern history—a sort of explanatory chart by which we perceive the relations of one state and empire to another, and mark how their boundaries advance or recede, fluctuate or become defined, and then furnishes a neat and concise digest of the history of each kingdom or division of the world. The book is a universal storehouse of historical facts, classified, chronologically arranged, linked by succinct narrative, and brought down to the present times. To the historical student, and to all general readers, the work is invaluable for constant reference, if only for its copious and minutely-accurate dates, and it must form an indispensable complement to all libraries."—HURDIS.

MAUNDER.—THE TREASURY OF KNOWLEDGE,

AND LIBRARY OF REFERENCE: containing a new and enlarged Dictionary of the English Language, preceded by a Compendious Grammar, Verbal Distinctions, &c.; a new Universal Gazetteer; a Compendious Classical Dictionary; a Chronological Analysis of General History; a Dictionary of Law Terms, &c. &c. By SAMUEL MAUNDER. 14th Edition, 1 vol. fcp. 8vo. pp. 810, with two engraved Frontispieces, ss. 6d. cloth; bound in roan, 10s. 6d.

MAUNDER.—THE SCIENTIFIC & LITERARY TREASURY;

A new and popular Encyclopedia of Science and the Belles-Lettres; including all Branches of Science, and every Subject connected with Literature and Art. The whole written in a familiar style, adapted to the comprehension of all persons desirous of acquiring information on the subjects comprised in the work, and also adapted for a Manual of convenient Reference to the more instructed. By SAMUEL MAUNDER. 3d Edition, 1 thick vol. fcp. 8vo. with engraved Frontispiece, 10s. cloth; bound in roan, 12s.

MAUNDER.—THE BIOGRAPHICAL TREASURY;

Consisting of Memoirs, Sketches, and brief Notices of above 12,000 Eminent Persons of all Age and Nations, from the Earliest Period of History; forming a new and complete Dictionary of Universal Biography. 4th Edition, with a "Supplement," from the Accession of Queen Victoria to the Present Time. By SAMUEL MAUNDER. 1 vol. fcp. 8vo. with engraved Frontispiece, 8s. 6d. cloth; bound in roan, 10s. 6d.

MAUNDER.—THE UNIVERSAL CLASS-BOOK:

A new Series of Reading Lessons (original and selected) for Every Day in the Year; each Lesson recording some important Event in General History, Biography, &c. which happened on the day of the month under which it is placed, or detailing, in familiar language, interesting facts in Science; also a variety of Descriptive and Narrative Pieces, interspersed with Poetical gleanings: Questions for Examination being appended to each day's Lesson, and the whole carefully adapted to Practical Tuition. By SAMUEL MAUNDER, Author of "The Treasury of Knowledge." 2d Edition, revised, 12mo. 5s. bound.

MODERN SYRIANS;

Or, Native Society in Damascus, Aleppo, and the Mountains of the Druses. From Notes made during a Residence in those parts in 1841, 42, and 43. By an Oriental Student. Post 8vo. 10s. 6d.

"A lively picture of the domestic manners, the moral and political condition, and the general characteristics of the present inhabitants of Syria, together with a description of her scenery, resources, and topography. It is the work of an intelligent and enterprising tourist, and his account of his studies is very interesting and animated."

LONDON: SERVICE GAZETTE.

MONTGOMERY'S (JAMES) POETICAL WORKS.

New and only Complete Edition. With some additional Poems, and Autobiographical Prefaces. Collected and Edited by Mr. MONTGOMERY. 4 vols. fcp. 8vo. with Portrait, and Seven other beautifully-engraved Plates, 20s. cloth; or bound in morocco, gilt edges, 36s.

MOORE'S POETICAL WORKS;

Containing the Author's recent Introduction and Notes. Complete in one volume, uniform with Lord Byron's Poems. With a New Portrait, by George Richmond, engraved in the line manner, and a View of Sloperton Cottage, the Residence of the Poet, by Thomas Crowwick, A.R.A. Medium 8vo. 21s. cloth; or 42s. bound in morocco, in the best manner, by Hayday.

* Also, an Edition in 10 vols. fcp. 8vo. with Portrait, and 19 Plates. 21s. 10s. cloth morocco, 44. 10s.

MOORE'S LALLA ROOKH.

Twentieth Edition, 1 vol. medium 8vo. beautifully illustrated with 13 Engravings finished in the highest style of Art. 21s. handsomely bound in cloth and ornamented; morocco, 35s; or, with India Proof Plates, 42s. cloth.

MOORE'S LALLA ROOKH.

Twenty-first Edition, 1 vol. fcp. 8vo. with Four Engravings, from Paintings by Westall, 10s. 6d. cloth; or, handsomely bound in morocco, with gilt edges, 14s.

MOORE'S IRISH MELODIES.

New Edition, imp. 8vo. illustrated with above 50 Designs by MacIise, etched on steel, 22s. 2s.; Proofs on India Paper, 44. 4s.; before Letters (of Illustrations only), 26. 6s. [In the Press.

The Poetry and Designs will both be engraved, and each page surrounded with an Ornamental Border.

MOORE'S IRISH MELODIES.

Fifteenth Edition, with Engraved Title and Vignette, 10s. cloth lettered; or 13s. 6d. handsomely bound in morocco, with gilt edges.

MOORE.—THE HISTORY OF IRELAND.

By THOMAS MOORE, Esq. Vols. 1 to 3, with Vignette Titles, 18s. cloth.

"Mr. Moore fortunately brings to his labours not only extensive learning in the rarely-trodden paths of Irish history, but strict impartiality, rendered still more clear and uncompromising by an ennobling love of liberty. Every page of his work contains evidence of research; and innumerable passages might be cited in proof of the independent and truth-seeking spirit of the author."—*ATHENÆUM*.

MORAL OF FLOWERS.

3d Edition, 1 vol. royal 8vo. with 24 beautifully-coloured Engravings, 21. 10s. half-bound.

MORTON.—A VETERINARY TOXICOLOGICAL CHART,

Containing those Agents known to cause Death in the Horse; with the Symptoms, Antidotes, Action on the Tissues, and Tests. By W. J. T. MORTON. 12mo. 6s. in case; on rollers, 8s. 6d.

MORTON.—A MANUAL OF PHARMACY,

For the Student in Veterinary Medicine; containing the Substances employed at the Royal Veterinary College, with an attempt at their classification, and the Pharmacopœia of that Institution. By W. J. T. MORTON. 3d Edition, 12mo. 10s. cloth.

MOSELEY.—THE MECHANICAL PRINCIPLES OF ENGINEERING AND ARCHITECTURE. By the Rev. H. MOSELEY, M.A. F.R.S., Professor of Natural Philosophy and Astronomy in King's College, London; and Author of "Illustrations of Mechanics," &c. 1 vol. 8vo. with Woodcuts and Diagrams, 24s. cloth.

"The work of Mr. Moseley is an elaborate, profound, accurate, and elegant abstract, and purely mathematical discussion on the theoretical principles of mechanics; and will serve to increase the author's high reputation as a mathematician."—*ATHENÆUM*.

MOSELEY.—ILLUSTRATIONS OF PRACTICAL MECHANICS.

By the Rev. H. MOSELEY, M.A., Professor of Natural Philosophy and Astronomy in King's College, London; being the First Volume of the Illustrations of Science by the Professors of King's College. 1 vol. fcp. 8vo. with numerous Woodcuts, 8s. cloth.

MÜLLER.—INTRODUCTION TO A SCIENTIFIC SYSTEM

OF MYTHOLOGY. By C. O. MÜLLER, Author of "The History and Antiquities of the Doric Race," &c. Translated from the German by John Leitch. 8vo. uniform with "Müller's Dogians," 12s. cloth.

"Clearing away the obscurity and confusion in which mythology were enveloped by the glosses of the later and more official ages, Müller has reduced it to its primary elements, and disentangling the beautiful legends of antiquity from the crowd of fancies by which they were adorned, presented them to the world in the graceful form in which they originally sprang from the mind of popular superstition. In this he has rendered an important service, not only to those who wish to obtain a thorough understanding of the character and literature of the ancient Greeks, but to enquire into several philosophical and the history of natural religion. At the same time, the acuteness and sobriety of his judgment make him a safe guide to the practical student. His work has now been admirably translated by Mr. Leitch, whose version, combining freedom, fidelity, and elegance, is all that can be wished."—*MORNING CHRONICLE*.

MURRAY.—ENCYCLOPEDIA OF GEOGRAPHY;

Comprising a complete Description of the Earth: exhibiting its Relation to the Heavenly Bodies, its Physical Structure, the Natural History of each Country, and the Industry, Commerce, Political Institutions, and Civil and Social State of all Nations. By HUGH MURRAY, F.R.S.E.: assisted in Astronomy, &c. by Professor Wallace; Geology, &c. by Professor Jameson; Botany, &c. by Sir W. J. Hooker; Zoology, &c. by W. Swainson, Esq. New Edition, with Supplement, bringing down the Statistical Information contained in the work to Dec. 1843, with 82 Maps, drawn by Sidney Hall, and upwards of 1000 other Engravings on Wood, from Drawings by Swainson, T. Landseer, Sowerby, Strutt, &c. representing the most remarkable Objects of Nature and Art in every Region of the Globe. 1 vol. 8vo. containing upwards of 1500 pages, £3. cloth.

* * * The SUPPLEMENT, containing the most important Recent Information, may be had separately, price 1s.

NICOLAS.—THE CHRONOLOGY OF HISTORY.

Containing Tables, Calculations, and Statements indispensable for ascertaining the Dates of Historical Events, and of Public and Private Documents, from the Earliest Period to the Present Time. By Sir HARRIS NICOLAS, K.C.M.G. Second edition, corrected throughout. 1 vol. fcp. 8vo. with Vignette Title, 6s. cloth.

"We strongly recommend to historical students the clear and accurate 'Chronology of History,' by Sir Harris Nicolas, which contains all the information that can be practically required."—*QUARTERLY REVIEW*.

OWEN.—LECTURES ON THE COMPARATIVE ANATOMY AND PHYSIOLOGY OF THE INVERTEBRATE ANIMALS,

delivered at the Royal College of Surgeons in 1843. By RICHARD OWEN, F.R.S. Hunterian Professor to the College. From Notes taken by William White Cooper, M.R.C.S. and revised by Professor Owen. With Glossary and Index. 8vo. with nearly 140 Illustrations on Wood, 14s. cloth.

"By all who know the importance of Professor Owen's labours in the vast field of comparative anatomy, this work will be hailed with delight. It treats only of the anatomy of Invertebrata. Although delivered to medical men, the lectures contain a vast amount of matter interesting to all who wish to know something of the wonderful laws which govern the structure and functions of animated beings. We can also recommend them as being admirable examples of the application of the principles of inductive science to the study of organized matter."

Dr. Lindley, in *THE GARDENERS' CHRONICLE*.

* * * A Second and concluding Volume, being the Lectures (*On Vertebrata*) delivered by Prof. Owen during the present session, is in the Press.

PARKES.—DOMESTIC DUTIES;

Or, Instructions to Young Married Ladies on the Management of their Households, and the Regulation of their Conduct in the various Relations and Duties of Married Life. By Mrs. W. PARKES. 5th Edition, fcp. 8vo. 9s. cloth.

Social Relations—Household Concerns—the Regulation of Time—Moral and Religious Duties.

PARNELL.—A TREATISE ON ROADS;

Wherein the Principles on which Roads should be made are explained and illustrated by the Plans, Specifications, and Contracts made use of by Thomas Telford, Esq. on the Holyhead Road. By the Right Hon. Sir HENRY PARNELL, Bart., Hon. Memb. Inst. Civ. Eng. London. Second Edition, greatly enlarged, with 9 large plates, £1. 1s. cloth.

PEARSON.—PRAYERS FOR FAMILIES:

Consisting of a Form, short but comprehensive, for the Morning and Evening of every day in the week. Selected by the late E. PEARSON, D.D. Master of Sidney Sussex College, Cambridge. To which is prefixed, a Biographical Memoir of the Editor. New Edit. 18mo. 2s. 6d. cloth.

PEARSON.—AN INTRODUCTION TO PRACTICAL ASTRO-

NOMY. By the Rev. W. PEARSON, LL.D. F.R.S., &c., Rector of South Killworth, Leicestershire, and Treasurer to the Astronomical Society of London. 2 vols. 4to. with Plates, £7. 7s. boards.

Vol. 1 contains Tables, recently computed, for facilitating the Reduction of Celestial observations; and a popular explanation of their Construction and Use.

Vol. 2 contains Descriptions of the various Instruments that have been usefully employed in determining the Places of the Heavenly Bodies, with an Account of the Methods of Adjusting and Using them.

PERCIVALL.—HIPPOPATHOLOGY;

A Systematic Treatise on the Disorders and Lameness of the Horse; with their modern and most approved Methods of Cure; embracing the doctrines of the English and French Veterinary Schools. By W. PERCIVALL, M.R.C.S. Veterinary Surgeon in the 1st Life Guards. Vol. 1, 8vo. pp. 340, 10s. 6d. boards; Vol. 2, 8vo. pp. 436, 14s. boards.

PERCIVALL.—THE ANATOMY OF THE HORSE;

Embracing the Structure of the Foot. By W. PERCIVALL, M.R.C.S. 8vo. pp. 478, 1s. cloth.

PEREIRA.—A TREATISE ON FOOD AND DIET: . . .

With Observations on the Dietetical Regimen suited for Disordered States of the Digestive Organs; and an Account of the Dietaries of some of the principal Metropolitan and other Establishments for Paupers, Lunatics, Criminals, Children, the Sick, &c. By JON. PEREIRA, M.D. F.R.S. & L.S. Author of "Elements of Materia Medica." 8vo. 16s. cloth.

"Invaluable to the professional, and interesting even to the general reader. It is written in that clear, and easy style which characterises Dr. Pereira's writings, and which possesses such charms for those who like scientific books when they are not too dry." We may, in fine, pronounce it well worthy of the author of the best work on Materia Medica and Therapeutics of the age in which he lives.—*CHURCHMAN*.

PHILLIPS.—AN ELEMENTARY INTRODUCTION TO MINE-

RALOGY; comprising a Notice of the Characters and Elements of Minerals; with Accounts of the Places and Circumstances in which they are found. By WILLIAM PHILLIPS, F.L.S. M.G.S., &c. 4th Edition, considerably augmented by R. ALLAN, F.R.S.E. 8vo. numerous Cuts, 12s. cloth.

PHILLIPS.—FIGURES AND DESCRIPTIONS OF THE

PALÆOZOIC FOSSILS OF CORNWALL, DEVON, and WEST SOMERSET; observed in the course of the Ordnance Geological Survey of that District. By JOHN PHILLIPS, F.R.S. F.G.S. &c. Published by Order of the Lords Commissioners of H.M. Treasury. 8vo. with 60 Plates, comprising very numerous figures, 9s. cloth.

PHILLIPS.—A GUIDE TO GEOLOGY.

By JOHN PHILLIPS, F.R.S.G.S., &c. 1 vol. fcp. 8vo. with Plates, 6s. cloth.

PHILLIPS.—A TREATISE ON GEOLOGY.

By JOHN PHILLIPS, F.R.S.G.S., &c. 2 vols. fcp. 8vo. with Vignette Titles and Woodcuts, 12s. cloth.

PORTER.—A TREATISE ON THE MANUFACTURE OF SILK.

By G. R. PORTER, Esq. F.R.S. Author of "The Progress of the Nation," &c. 1 vol. 8vo. with Vignette Title, and 39 Engravings on Wood, 6s. cloth.

PORTER.—A TREATISE ON THE MANUFACTURES OF

PORCELAIN AND GLASS. By G. R. PORTER, Esq. F.R.S. 1 vol. fcp. 8vo. with Vignette Title and 50 Woodcuts, 6s. cloth.

PORTLOCK.—REPORT ON THE GEOLOGY OF THE COUNTY

of LONDONDERRY, and of Parts of Tyrone and Fermanagh, examined and described under the Authority of the Master-General and Board of Ordnance. By J. E. PORTLOCK, F.R.S. &c. 8vo. with 48 Plates, 24s. cloth.

POSTANS.—PERSONAL OBSERVATIONS ON SINDH,

The Manners and Customs of its Inhabitants, and its Productive Capabilities: with a Narrative of the Recent Events. By Capt. POSTANS, Bombay Army, late Assistant to the Political Agent, Sindh. 8vo. with new Map, coloured Frontispiece, and other Illustrations, 18s. cloth.

"For the interesting details of the manners and customs of the Sindhians of all classes, and the various particulars which make up the description of the country, we refer the reader to Capt. Postans' valuable work, which cannot fail to afford him equal information and amusement."—*ASIATIC JOURNAL*.

POWELL.—THE HISTORY OF NATURAL PHILOSOPHY,

From the Earliest Periods to the Present Time. By **BADEN POWELL, M.A.**, Savilian Professor of Mathematics in the University of Oxford. 1 vol. fcp. 8vo. Wignette Title, 6s. cloth.

PROCEEDINGS OF THE ZOOLOGICAL SOCIETY OF LONDON.

8vo. The last part published is Part 10 for 1842, 6s. cloth.

PYCROFT (REV. J.)—A COURSE OF ENGLISH READING,

adapted to every Taste and Capacity: with Anecdotes of Men of Letters. By the Rev. **JAMES PYCROFT, B.A.** Trinity College, Oxford; Author of "Latin Grammar Practice," and "Greek Grammar Practice," fcp. 8vo. 6s. 6d. cloth.

"A book of unquestionable utility and sound advice, designed chiefly to recommend and indicate the study of convenient epistoles before attempting the deliberate perusal of the larger works in history, philosophy, religion, biography, and other branches of knowledge, and then only so much as inclination may suggest."—**ATHENÆUM.**

REECE.—THE MEDICAL GUIDE,

For the use of the Clergy, Heads of Families, Seminaries, and Junior Practitioners in Medicine; comprising a complete Modern Dispensary, and a Practical Treatise on the Distinguishing Symptoms, Causes, Prevention, Cure and Palliation, of the Diseases incident to the Human Frame. By **R. REECE, M.D.** late Fellow of the Royal College of Surgeons of London, &c. 16th Edition, 8vo. pp. 600, 12s. boards.

REID (DR.)—ILLUSTRATIONS OF THE PRINCIPLES AND

PRACTICE of WARMING and VENTILATING, with Preliminary Remarks on Health and Length of Life. By **D. R. REID, M.D. F.R.S.E.** 8vo. With Diagrams, and 320 Engravings on wood. 16s.

The object of this work is to facilitate the more general introduction of Systematic Ventilation in Public Buildings and Private Dwelling-houses, and in Mines, Ships, and Manufacturing-factories.

"A very clever, ingenious, and learned treatise, of practical utility and concern to all classes of people. Almost every point of view in which the subjects of warming and ventilation can be taken is presented to the reader in this masterly work. They are pursued in public and private buildings, in churches and chapels, in ships, manufactories, and mines. The details are very curious, and greatly assisted in effect by the profuse employment of diagrams and woodcuts. Every thing is done, in short, to make the information acceptable to non-professional readers, as well as available for the uses of the architect and physician."—**EXAMINER.**

REPTON.—THE LANDSCAPE GARDENING & LANDSCAPE

ARCHITECTURE of the late **HUMPHRY REPTON, Esq.**; being his entire works on these subjects. New Edition, with an historical and scientific Introduction, a systematic Analysis, a Biographical Notice, Notes, and a copious alphabetical Index. By **J. C. LOUPON, F.L.S. &c.** Originally published in 1 folio and 3 quarto volumes, and now comprised in 1 vol. 8vo. Illustrated by upwards of 250 Engravings, and Portrait, 30s. cloth; with coloured plates, £3. 6s. cloth.

RIDDLE.—A COMPLETE ENGLISH-LATIN AND LATIN-

ENGLISH DICTIONARY, compiled from the best sources, chiefly German. By the Rev. **J. E. RIDDLE, M.A.** 3d Edition, corrected and enlarged. 8vo. 31s. 6d. cloth.

. Separately—The English-Latin part, 10s. 6d. cloth; the English-Latin part, 21s. cloth.

RIDDLE.—A DIAMOND LATIN ENGLISH DICTIONARY.

For the waistcoat-pocket. A Guide to the Meaning, Quality, and right Accentuation of Latin Classical Words. By the Rev. **J. E. RIDDLE, M.A.** Royal 32mo. 4s. bound.

"A most useful little lexicon to the general reader who may wish for an accommodating interpreter of such Latin words or sentences as may be encountered in every day's casual literary exercises. It is at once copious and succinct."—**MORNING HERALD.**

RIDDLE.—LETTERS FROM AN ABSENT GODFATHER;

Or, a Compendium of Religious Instruction for Young Persons. By the Rev. **J. E. RIDDLE, M.A.** fcp. 8vo. 6s. cloth.

RIDDLE.—ECCLESIASTICAL CHRONOLOGY;

Or, Annals of the Christian Church, from its Foundation to the present Time. Containing a View of General Church History, and the Course of Secular Events; the Limits of the Church and its Relations to the State; Controversies; Sects and Parties; Rites, Institutions, and Discipline; Ecclesiastical Writers. The whole arranged according to the order of Dates, and divided into Seven Periods. To which are added, Lists of Councils and Popes, Patriarchs, and Archbishops of Canterbury. By the Rev. **J. E. RIDDLE, M.A.**, Author of "The Complete Latin Dictionary." 8vo. 15s. cloth.

RIVERS.—THE ROSE AMATEUR'S GUIDE;

Containing ample Descriptions of all the fine leading varieties of Roses, regularly classed in their respective Families; their History and mode of Culture. By **T. RIVERS, Jun.** 3d Edition, corrected and improved, fcp. 8vo. 6s. cloth.

"Mr. Rivers is the best authority on the subject of the cultivation of the rose; his book is unexceptionable and comprehensive, and supplies, indeed, all the information regarding the various varieties, that can be desired." **GENTLEMAN'S MAGAZINE.**

ROBERTS.—A COMPREHENSIVE VIEW OF THE CULTURE
of the VINE under GLASS. By JAMES ROBERTS, Gardener to M. Wilson, Esq., Eshton Hall, Yorkshire. 12mo. 5s. 6d. cloth.

ROBERTS.—AN ETYMOLOGICAL AND EXPLANATORY
DICTIONARY of the Terms and Language of GEOLOGY; designed for the early Student, and those who have not made great progress in the Science. By G. ROBERTS. Fcp. 6s. cloth.

ROBINSON.—GREEK AND ENGLISH LEXICON TO THE
NEW TESTAMENT. By E. ROBINSON, D.D. Author of "Biblical Researches." Edited, with careful revision, corrections, &c. by the Rev. Dr. BLOOMFIELD. 1 vol. 8vo. 18s. cloth.

ROGERS.—THE VEGETABLE CULTIVATOR;

Containing a plain and accurate Description of all the different Species of Culinary Vegetables, with the most approved Method of Cultivating them by Natural and Artificial Means, and the best Modes of Cooking them; alphabetically arranged. Together with a Description of the Physical Herbs in General Use. Also, some Recollections of the Life of PHILIP MILLER, F.A.S., Gardener to the Worshipful Company of Apothecaries at Chelsea. By JOHN ROGERS, Author of "The Fruit Cultivator." 2d Edition, fcp. 8vo. 7s. cloth.

"Rogers's 'Vegetable Cultivator' is an useful book."—Prof. LINDLEY, in THE GARDENERS' CHRONICLE.

ROME.—THE HISTORY OF ROME.

2 vols. fcp. 8vo. with Vignette Titles, 12s. cloth.

RONALDS.—THE FLY-FISHER'S ENTOMOLOGY,

Illustrated by Coloured Representations of the Natural and Artificial Insect; and accompanied by a few Observations and Instructions relative to Trout and Grayling Fishing. By ALFRED RONALDS. 2d Edition, with 20 Copperplates, coloured, 8vo. 14s. cloth.

ROSCOE.—LIVES OF EMINENT BRITISH LAWYERS.

By HENRY ROSCOE, Esq. 1 vol. fcp. 8vo. with Vignette Title, 6s. cloth.

SANDBY (REV. G.)—MESMERISM AND ITS OPPONENTS:

With a Narrative of Cases. By the Rev GEORGE SANDBY, Jun. Vicar of Flinton, and Rector of All Saints with St. Nicholas, South Elmham, Suffolk; Domestic Chaplain to the Right Hon. the Earl of Abergavenny. Fcp. 8vo. 6s. cloth.

"A book written by a clergyman well known to be a man of high character, great talent, and clear intellect, coolly turning supposed illusions into facts, proving their reality by a cloud of witnesses in addition to his own experience, and accounting on philosophical principles for seeming miracles, led in which had been set down as evidence either of the grossest ignorance or the wildest insanity! We look upon the appearance of Mr. Sandby's volume as an important event in the progress of philosophy, for it is impossible to respect the author of either folly or charlatanism. His cases are sobriety stated, his reasonings logical, and his deductions inevitable."—INDIAN NEWS.

SANDFORD.—WOMAN IN HER SOCIAL AND DOMESTIC

CHARACTER. By Mrs. JOHN SANDFORD. 6th Edition, fcp. 8vo. 6s. cloth.

Causes of Female Influence; Value of Letters to Woman; Importance of Religion to Woman; Christianity the Source of Female Excellence; Scripture illustrative of Female Character; Female Influence on Religion; Female Defects; Female Romance; Female Education; Female Duties.

SANDFORD.—FEMALE IMPROVEMENT.

By Mrs. JOHN SANDFORD. 2d Edition, fcp. 8vo. 7s. 6d. cloth.

- The Formation of Female Character; Religion a paramount Object; the Importance of Religious Knowledge; Christianity, Doctrinal and Practical; the Employment of Time; Study, its Mode and its Recommendation; Accomplishment; Temper; Taste; Benevolence; Marriage; the Young Wife; the Young Mother.

SANDHURST COLLEGE MATHEMATICAL COURSE

ELEMENTS of ARITHMETIC and ALGEBRA. By W. SCOTT, Esq. A.M. and F.R.S. Second Mathematical Professor at the Royal Military College, Sandhurst. Being the Second Volume of the Sandhurst Course of Mathematics. 8vo. 16s. bound.

"This excellent treatise is admirably adapted for the purpose which it is intended to answer, and certain to prove as permanently beneficial to the interests and credit of the Institution as it is honourable to Prof. Scott's talents. It is, we perceive, the first of a series which is to constitute a general course of mathematics, and which, when completed, will be an invaluable addition to the text-books already in use at Sandhurst."—UNITED SERVICE GAZETTE.

PRACTICAL ASTRONOMY AND GEODESY. By JOHN NARRIEEN, F.R.S and R.A.S. Professor of Mathematics in the Royal Military College, Sandhurst. Being the 3rd Volume of the Sandhurst Mathematical Course. 8vo. [Just ready.]

ELEMENTS of GEOMETRY; consisting of the first Four and Sixth Books of Euclid, chiefly from the Text of Dr. Robert Simson: with the principal Theorems in Proportions, and a Course of Practical Geometry on the Ground; also, Four Tracts relating to Circles, Planes, and Solids, with one on Spherical Geometry. By Mr. NARRIEEN, Professor of Mathematics in the Royal Military College, Sandhurst. Being the First Volume of the Sandhurst Course of Mathematics. 8vo. with many diagrams, 10s. 6d. bound.

SAVAGE.—A DICTIONARY OF PRINTING.

By WILLIAM SAVAGE, Author of "Practical Hints on Decorative Printing," and a Treatise "On the Preparation of Printing Ink, both Black and Coloured." In 1 vol. 8vo. with numerous Diagrams, £1. 6s. cloth.

SCORESBY.—MAGNETICAL INVESTIGATIONS.

By the Rev. WILLIAM SCORESBY, D.D. F.R.S.L. and E. &c. &c. Comprising Investigations concerning the Laws or Principles affecting the Power of Magnetic Steel Plates or Bars, in combination as well as singly, under various conditions as to Mass, Hardness, Quality, Form, &c. as also concerning the comparative Powers of Cast Iron. Part 2, 8vo. 10s. 6d. cloth.

Part 1, with Plates, 5s.

SCOTT.—THE HISTORY OF SCOTLAND.

By Sir WALTER SCOTT, Bart. New edition. 2 vols. fcp. 8vo. with Vignette Titles, 12s. cloth.

SEAWARD.—SIR EDWARD SEAWARD'S NARRATIVE OF

HIS SHIPWRECK, and consequent Discovery of certain Islands in the Caribbean Sea: with a detail of many extraordinary and highly interesting Events in his Life, from 1733 to 1749, as written in his own Diary. Edited by Miss JANE PORTER. 3d Edition, with a New Nautical and Geographical Introduction, containing Extracts from a Paper by Mr. C. F. Collett, of the Royal Navy, identifying the islands described by Sir E. Seaward. 2 vols. post 8vo. 21s. cloth.

SELECT WORKS OF THE BRITISH POETS,

From Chaucer to Withers. With Biographical Sketches, by R. SOUTHBY, LL.D. 1 vol. 8vo. 39s. cloth; with gilt edges, 31s. 6d.

SELECT WORKS OF THE BRITISH POETS,

From Ben Jonson to Beattie. With Biographical and Critical Prefaces, by DR. Aikin. 1 vol. 8vo. 18s. cloth; with gilt edges, 20s.

*. The peculiar nature of these two works is, that the Poems are printed entire, without mutilation or abridgment, care being taken that such poems only are included as are fit for the perusal of youth, or for reading aloud.

SHAKSPEARE, BY BOWDLER.

THE FAMILY SHAKSPEARE; in which nothing is added to the Original Text; but those words and expressions are omitted which cannot with propriety be read aloud. By T. BOWDLER, Esq. F.R.S. Seventh Edition (1839), 1 large vol. 8vo. with 36 Illustrations after Smirke, &c. 30s. cloth; or 31s. 6d. gilt edges.

*. A LIBRARY EDITION, without Illustrations, 8 vols. 8vo. £4. 14s. 6d. boards.

SHELLEY, &c.—LIVES OF THE MOST EMINENT LITERARY

MEN OF ITALY, SPAIN, and PORTUGAL. By Mrs. SHELLEY, Sir D. BREWSTER, J. MONTGOMERY, &c. 3 vols. fcp. 8vo. with Vignette Titles, 18s. cloth.

SHELLEY.—LIVES OF MOST EMINENT FRENCH WRITERS.

By Mrs. SHELLEY, and others. 2 vols. fcp. 8vo. with Vignette Titles, 12s. cloth.

SHORT WHIST:

Its Rise, Progress, and Laws; with Observations to make any one a Whist Player; containing also the Laws of Piquet, Cassino, Ecarté, Cribbage, Backgammon. By Major A * * * *. 7th Edition. To which are added, Precepts for Tyros. By Mrs. B * * * *. Fcp. 8vo. 3s. cloth, gilt edges.

SISMONDI.—HISTORY OF THE ITALIAN REPUBLICS;

Or, of the Origin, Progress, and Fall of Freedom in Italy, from A.D. 476 to 1805. By J. C. L. DE SISMONDI. 2 vols. fcp. 8vo. with Vignette Titles, 12s. cloth.

SISMONDI.—THE HISTORY OF THE FALL OF THE ROMAN

EMPIRE. Comprising a View of the Invasion and Settlement of the Barbarians. By J. C. L. DE SISMONDI. 2 vols. fcp. 8vo. with Vignette Titles, 12s. cloth.

SMITH.—THE ENGLISH FLORA.

By Sir JAMES EDWARD SMITH, M.D. F.R.S., late President of the Linnean Society, &c. 3 vols. 8vo. £3. 12s. boards.

Contents:—Vols. I. to IV. The Flowering Plants and the Ferns, £2. 8s.

Vol. V. Part 1, 12s.—CRYPTOGAMIA; comprising the Mosses, Hepaticæ, Lichens, Characeæ, and Algae. By Sir W. J. HOOKER.

Vol. V. Part 2, 12s.—The Fungi—completing the work, by Sir J. W. HOOKER, and the Rev. M. J. BERKELEY, F.L.S. &c.

SMITH.—COMPENDIUM OF THE ENGLISH FLORA.

By Sir J. E. SMITH. 2d Edition, with Additions and Corrections. By Sir W. J. HOOKER. 12mo. 7s. 6d. cloth.

THE SAME IN LATIN. 5th Edition, 12mo. 7s. 6d.

SMITH.—AN INTRODUCTION TO THE STUDY OF BOTANY.

By Sir J. E. SMITH, late President of the Linnean Society. 7th Edition (1833), corrected; in which the object of Smith's "Grammar of Botany" is combined with that of the "Introduction." By Sir WILLIAM JACKSON HOOKER, K.H., LL.D., &c. 1 vol. 8vo. pp. 522, 36 Steel Plates, 16s. cloth; with the Plates coloured, £2. 12s. 6d. cloth.

SMITH.—THE WORKS OF THE REV. SYDNEY SMITH.

2d Edition, 3 vols. 8vo. with Portrait, pp. 1412, 36s. cloth.

This collection consists of the author's contributions to the Edinburgh Review, Peter Plymley's Letters on the Catholics, and other miscellaneous works.

By the same Author, 2d Edition.

LETTERS on AMERICAN DEBTS. First printed in "The Morning Chronicle." 8vo. 6d.

SMITH.—LETTERS ON THE SUBJECT OF THE CATHOLICS,

to my Brother Abraham who lives in the Country. By PETER PLYMLEY. 21st Edition, post 8vo. pp. 200, 7s. cloth.

SMITH.—THE MEMOIRS OF THE MARQUIS DE POMBAL.

By JOHN SMITH, Private Secretary to the Marquis De Saldana. 2 vols. post 8vo. with Portrait and Autographs, 21s. cloth.

These Memoirs of this illustrious Portuguese Statesman, designated by his countrymen the "GREAT MARQUIS," contain details of the terrible earthquake in 1755—the energy of Pombal on that awful occasion—the establishment of the United Wine Company—the Duke of Aveiro's conspiracy—rupture with the Court of Rome—strange intrigues of the Jesuit Malagrida—suppression of the Jesuit order throughout Europe effected by Pombal's energy and address—family compact and war with France and Spain—extensive reforms and flourishing condition of Portugal—death of the King—Pombal's resignation, examination, sentence, illness, and death. The whole interspersed with extracts from the despatches of Mr. Hay, Lord Kinnoul, Mr. Walpole, &c. never before published.

SMITH.—AN INQUIRY INTO THE NATURE AND CAUSES

OF THE WEALTH OF NATIONS. By ADAM SMITH, LL.D. With a Life of the Author, an Introductory Discourse, Notes, and Supplemental Dissertations. By J. R. McCULLOCH, New Edition, corrected throughout, and greatly enlarged, 8vo. with Portrait, £1. 1s. cloth.

SOUTHEY'S (ROBERT) COMPLETE POETICAL WORKS;

Containing all the Author's last Introductions and Notes. Complete in one volume, medium 8vo. with Portrait and Vignette, uniform with Byron's Poems and Thomas Moore's Poetical Works, 21s.; or 42s. bound in morocco, in the best manner, by Hayday.

Also, an Edition in 10 vols. fcp. 8vo. with Portrait and 19 Plates, £2. 10s.

The following may be had, separately, in cloth:—

JOAN OF ARC.....	1 vol. 5s.	THALABA.....	1 vol. 5s.
MADOC.....	1 vol. 5s.	BALLADS, &c.....	2 vols. 10s.
CURSE of KEHAMA.....	1 vol. 5s.	RODERICK.....	1 vol. 5s.

SOUTHEY, &c.—LIVES OF THE BRITISH ADMIRALS;

With an Introductory View of the Naval History of England. By R. SOUTHEY, Esq. and R. BELL, Esq. 5 vols. fcp. 8vo. with Vignette Titles, £1. 10s. cloth.

SPACKMAN.—STATISTICAL TABLES

Of the Agriculture, Shipping, Colonies, Manufactures, Commerce, and Population of the United Kingdom of Great Britain and its Dependencies, brought down to the year 1843. Compiled from Official Returns. By W. F. SPACKMAN, Esq. Fcp. 8vo. pp. 162, 5s. cloth.

SPALDING.—THE PHILOSOPHY OF CHRISTIAN MORALS.

By SAMUEL SPALDING, M.A. of the London University. 8vo. 10s. 6d. cloth.

The author of this work was a young man of great promise, who graduated at the London University in 1840, and died early in the present year, at the Cape of Good Hope, to which place he had repaired to recruit his strength, shattered by intense application to study. The work which he has left behind bears traces of a thinking mind, which must have done much in the field of science. Mr. Spalding's treatise is modelled to a great extent on the writings of that great ethical writer, Bishop Butler, and the whole work is throughout thoughtfully and eloquently written.

ATHEXAVM.

SPIRIT OF THE WOODS.

By the Author of "The Moral of Flowers." 2d Edition, 1 vol. royal 8vo. with 23 beautifully-coloured Engravings of the Forest Trees of Great Britain, £1. 1fs. 6d. cloth.

SPOONER.—A TREATISE ON THE STRUCTURE, FUNCTION,

AND DISEASES OF THE FOOT AND LEG OF THE HORSE; comprehending the Comparative Anatomy of these parts in other Animals, embracing the subject of Shoeing, and the proper Treatment of the Foot; with the Rationale and Effects of various Important Operations, and the best methods of performing them. By W. C. SPOONER, M.R.V.C. 12mo. pp. 398, 7s. 6d. cloth.

STEBBING.—THE HISTORY OF THE CHRISTIAN CHURCH,

from its Foundation to A.D. 1492. By the Rev. H. STEBBING, M.A. &c. 2 vols. fcp. 8vo. with Vignette Title, 12s. cloth.

STEBBING.—THE HISTORY OF THE REFORMATION.

By the Rev. H. STEBBING. 2 vols. fcp. 8vo. with Vignette Titles, 12s. cloth.

STEAM ENGINE, BY THE ARTIZAN CLUB.

A Treatise on the Steam Engine. By the ARTIZAN CLUB. Nos. 1 to 4, 4to. 1s. each, sewed. To be completed in 24 Monthly Parts, each illustrated by a Steel Plate and several Woodcuts.

This work will give a complete account of the Steam Engine as applied to Mines, Mills, Railways, and Steam Navigation; will contain Practical Rules and Examples of the best Machinery; and will be representative of the present state of Steam Science in England.

"The treatise is marked by the same cleverness and vivacity which belongs to 'the Club,' it is well illustrated with woodcuts, and seems likely, as far as we can judge, to answer the important purpose of diffusing sound information among the artisans of this country, in an agreeable and interesting manner."—RAILWAY CHRONICLE.

STEEL'S SHIPMASTER'S ASSISTANT,

And OWNER'S MANUAL; containing Information necessary for persons connected with Mercantile Affairs; consisting of the Regulation Acts of the Customs for the United Kingdom, and British Possessions abroad; Navigation Laws; Registry Acts; Duties of Customs of the United Kingdom, the British Plantations in America, Canada, and Isle of Man, in the East Indies, Cape of Good Hope, New South Wales, and Van Diemen's Land; Smuggling Acts; Pilotage throughout England and Scotland; Insurances; Commercial Treaties; Dock Charges on Shipping, &c. New Edition, corrected by J. STRICKMAN, Secretary to the East India and China Association. With Tables of Monies, Weights, Measures, and Exchanges. By Dr. KELLY. With a Supplement. 1 vol. 8vo. £1. 1s. cloth.

STEPHENS.—A MANUAL OF BRITISH COLEOPTERA;

or, BEETLES; containing a Description of all the Species of Beetles hitherto ascertained to inhabit Great Britain and Ireland, &c. With a Complete Index of the Genera. By J. F. STEPHENS, F.L.S. Author of "Illustrations of Entomology." 1 vol. post 8vo. 14s. cloth.

SWITZERLAND.—THE HISTORY OF SWITZERLAND.

1 vol. fcp. 8vo. with Vignette Title, 6s. cloth.

TATE.—THE CONTINUOUS HISTORY OF THE LIFE AND

WRITINGS OF ST. PAUL, on the basis of the Acts; with Intercalary Matter of Sacred Narrative, supplied from the Epistles, and elucidated in occasional Dissertations: with the *Homæ Pauline* of Dr. Paley, in a more correct edition, subjoined. By JAMES TATE, M.A. Canon Residentiary of St. Paul's. 8vo. with Map, 13s. cloth.

TATE.—HORATIUS RESTITUTUS;

Or, the Books of Horace arranged in Chronological Order, according to the Scheme of Dr. Bentley, from the Text of Gesner, corrected and improved. With a Preliminary Dissertation, very much enlarged, on the Chronology of the Works, on the Localities, and on the Life and Character of that Poet. By JAMES TATE, M.A. Second Edition. To which is now added, an original Treatise on the Metres of Horace. 8vo. 12s. cloth.

TAYLER (REV. CHARLES B.)—MARGARET;

Or, the Pearl. By the Rev. CHARLES B. TAYLER, M.A. Rector of St. Peter's, Chester, Author of "May You Like It," "Records of a Good Man's Life," &c. Fcp. 8vo. 6s. cloth.

"The design of this very pleasing and attractive story is to show the errors of Tractarianism, and the happy effects that flow from a strict discharge of our duties, religious and moral. The book is written in a style extremely graceful, and is altogether free from that narrow-minded spirit which has but too frequently appeared of late in works of the same description."—*ATLAS*.

TAYLER (REV. C. B.)—TRACTARIANISM NOT OF GOD!

Plain Sermons for the Times. By the Rev. C. B. TAYLER, M.A. Rector of St. Peter's, and Evening Lecturer of St. Mary's, Chester. [In the press.]

"And he reasoned with them out of the Scriptures."—*ACTS xvi. 2.*

TAYLER (REV. C. B.)—DORA MELDER;

A Story of Alsace. By META SANDER. A Translation. Edited by the Rev. C. B. TAYLER, Author of "Records of a Good Man's Life," &c. Fcp. 8vo. pp. 286, 2 Illustrations. 7s. cloth.

"In a literary point of view, this tale is admirably told, whilst its air of reality gives it a true claim

BRITISH MAGAZINE

TAYLOR.—THE STATESMAN.

By HENRY TAYLOR, Esq., Author of "Philip Van Artevelde" 12mo. 6s. 6d. boards.

THACKER.—THE COURSER'S ANNUAL REMEMBRANCER,

and STUD-BOOK; being an Alphabetical Return of the Running at all the Public Coursing Clubs in England, Ireland, and Scotland, for the Season 1841-42; with the Pedigrees (as far as received) of the Dogs that won, and the Dogs that ran up second for each Prize; also, a Return of all single Matches run at those Meetings; with a Preliminary Essay on the Decision of Short Courses. Frank Stone,
C. Stenhouse,
F. Taylor,

H. J. Townsend,
T. Webster, A.R.A.

Engraved by Thompson and other eminent Engravers.

Square crown 8vo. One Guinea; bound in morocco, in the best manner, by Hayday, 36s.

"Few works of the class have a fairer prospect of popularity than this new edition of THOMSON, illustrated by the members of the Etching Club. Most of the designs are in accordance with the spirit of the author,—some of them beautiful. The landscape vignettes contributed by Mr. CRESWICK entitle him to a first place as a book-illustrator, exhibiting a versatility of talent for which his want of admiring artists could hardly have been ventured to give him credit. Mr. F. TAYLER is not far behind, as his designs at pp. 11, 12, and 26, will most satisfactorily prove, and he comes one step nearer historical art than Mr. CRESWICK, in right of his clever management of rustic figures. Messrs. COPE, HORSLEY, REDGRAVE, and BELL, with all their true English feeling, and the grace of their conceptions, are a degree more ambitious. Mr. BELL's preparatory outline of 'Spring' gives indications of grace, poetry, and fancy, worthy of being earned in the highest perfection. This book is beautifully brought out; the vignettes are from copper blocks, produced by the electrolytic process. This gives a peculiarity of effect to the impressions more easy to perceive than to describe. Other of our classical poems are to follow, illustrated in a similar fashion. Mr. BOLTON CORNEY'S labours are not the less to be recommended because they are unobtrusive; the work is extremely well edited, and therefore entitled to a place on the library shelf as well as on the drawing-room table."—*ATLAS*.

Uniform with "Thomson's Seasons."

GOLDSMITH'S POETICAL WORKS, illustrated with Engravings on Wood, from Designs by MEMBERS of the ETCHING CLUB.—*In the press.*

THOMSON.—THE DOMESTIC MANAGEMENT OF THE SICK

ROOM, necessary, in Aid of Medical Treatment, for the Cure of Diseases. By ANTHONY TODD THOMSON, M.D. F.L.S. &c. Post 8vo. 10s. 6d. cloth.

THOMSON.—AN ELEMENTARY TREATISE ON ALGEBRA,
Theoretical and Practical. By JAMES THOMSON, LL.D. Professor of Mathematics in the University of Glasgow. 12mo. 5s. cloth.

"For clearness, simplicity, and completeness, it would be difficult to imagine a superior performance to Dr Thomson's. Any intelligent individual might teach himself from it, and in the hands of an able master it must prove invaluable. We recommend it to mathematical readers, teachers, and students, as incomparably the best elementary treatise and the most comprehensive text-book of the science."—*ATLAS*.

TOMLINS.—A POPULAR LAW DICTIONARY;

Familiarly explaining the Terms and Nature of English Law; adapted to the comprehension of persons not educated for the legal profession, and affording information peculiarly useful to Magistrates, Merchants, Parochial Officers, and others. By THOMAS EDLYNE TOMLINS, Attorney and Solicitor. In 1 thick vol. post 8vo. 18s. cloth.

* The whole work has been revised by a Barrister.

TOOKE.—A HISTORY OF PRICES;

With reference to the Causes of their principal Variations, from 1792 to the Present Time. Preceded by a Sketch of the History of the Corn Trade in the last Two Centuries. By THOMAS TOOKE, Esq. F.R.S. 2 vols. 8vo. £1. 10s. cloth.

(A Continuation of the Above.)

AN ACCOUNT OF PRICES and of the State of the CIRCULATION in 1838 and 1839; with Remarks on the Corn Laws, and on proposed Alterations in our Banking System. 8vo. 12s. cloth.

TRANSACTIONS OF THE ENTOMOLOGICAL SOCIETY.

8vo. The last part published is Part 4 of Vol. 3, 8vo. with Plates, 6s. 6d.

TRANSACTIONS OF THE ZOOLOGICAL SOCIETY OF

LONDON. 4to. The last part published is Part 3, Vol. 3, with Plates, 19s. 6d. coloured, and 12s. plain.

TRANSACTIONS OF THE INSTITUTION OF CIVIL

Engineers, 4to. Vol. II. with Twenty-three finely engraved Plates, 28s. cloth.

Vol. III. with Nineteen finely engraved Plates, £2. 12s. 6d. cloth.

TRANSACTIONS OF THE ROYAL INSTITUTE OF BRITISH

ARCHITECTS OF LONDON: consisting of a series of Papers on "Antiquities," and "Construction." By R. Willis, M.A. F.R.S. &c.; Ambrose Poynter; Herr Hallmann, of Hannover; Dr. Faraday; Mr. Bracebridge; Herr Beuth, of Berlin; Joseph Gwilt, F.S.A. F.A.S.; Mr. C. H. Smith; Mr. C. Fowler, Hon. Sec.; Mr. W. A. Nicholson, of Lincoln; and Mr. J. P. Papworth. Vol. I. Part 2, 4to. with numerous lithographic and woodcut illustrations, 24s. cloth.

* Part 1, Vol. I. uniform with the above, 16s. cloth.

TRANSACTIONS OF THE LINNEAN SOCIETY OF LONDON.

The last part published is Part 2, Vol. XIX. 4to. with Plates, 21s.

TROLLOPE.—THE LAURRINGTONS;

Or, Superior People. By Mrs. TROLLOPE, Author of "Widow Barnaby," &c. 3 vols. post 8vo. 31s. 6d. boards.

"Mrs. Trollope gains upon public opinion, as a novel writer, by every successive production of her prolific pen. 'The Laurringtons,' her last new novel, is vastly superior to 'Widow Barnaby,' on which we conclude, from its being associated with her name in the title-page, she founds her pretensions to public regard. The plot is simple, the characters comparatively few and their positions, sayings, and doings, perfectly in keeping. We predict that the work will be a favourite with the novel-reading portion of the public."—*Globe*.

TURNER.—THE HISTORY OF ENGLAND,

From the Earliest Period to the Death of Elizabeth. By SHARON TURNER, Esq. F.A.S. R.A.S.L. 12gols. 8vo. £8. 3s. cloth.

Or four separate portions, as follow:—

THE HISTORY of the ANGLO-SAXONS; comprising the History of England from the Earliest Period to the Norman Conquest. 6th Edition, 3 vols. 8vo. £2. 5s. boards.

THE HISTORY of ENGLAND during the MIDDLE AGES; comprising the Reigns from William the Conqueror to the Accession of Henry VIII., and also the History of the Literature, Religion, Poetry, and Progress of the Reformation and of the Language during that period. 3d Edition, 5 vols. 8vo. £3. boards.

THE HISTORY of the REIGN of HENRY VIII.; comprising the Political History of the commencement of the English Reformation: being the First Part of the Modern History of England. 3d Edition, 2 vols. 8vo. 26s. bds.

THE HISTORY of the REIGNS of EDWARD VI., MARY, and ELIZABETH; being the Second Part of the Modern History of England. 3d Edition, 2 vols. 8vo. 32s. boards.

TURNER.—THE SACRED HISTORY OF THE WORLD,

Philosophically considered. By SHARON TURNER, F.S.A. R.A.S.L. New Edit. 3 vols. 8vo. 42s.

Vol. 1 considers the Creation and System of the Earth, and of its Vegetable and Animal Races and Material Laws, and Formation of Mankind.

Vol. 2, the Divine Economy in its Special Relation to Mankind, and in the Deluge, and the History of Human Affairs;

Vol. 3, the Provisions for the Perpetuation and Support of the Human Race, the Divine System of our Social Combinations, and the Supernatural History of the World.

TURNER.—A TREATISE ON THE FOOT OF THE HORSE,

And a New System of Shoeing, by one-sided nailing; and on the Nature, Origin, and Symptoms of the Navicular Joint Lameness, with Preventive and Curative Treatment. By JAMES TURNER, M.R.V.C. Royal 8vo pp. 118; 7s. 6d. boards.

TURTON'S (DR.) MANUAL OF THE LAND AND FRESH-

WATER SHELLS OF THE BRITISH ISLANDS. A New Edition, thoroughly revised and with considerable Additions. By JOHN EDWARD GRAY, Keeper of the Zoological Collection in the British Museum. 1 vol. post 8vo. with Woodcuts, and 12 Coloured Plates 15s. cloth.

URE.—DICTIONARY OF ARTS, MANUFACTURES, & MINES;

Containing a clear Exposition of their Principles and Practice. By ANDREW URE, M.D. F.R.S. M.G.S. M.A.S. Lond.; M. Acad. N.L. Philad.; S. Ph. Soc. N. Germ. Milanov.; Milii. &c. &c. Third Edition, corrected, 8vo. illustrated with 1240 Engravings on Wood, 50s. cloth.

"To the manufacturing districts of England, to practical engineers, chemists, and inventors in all the branches of science, and, indeed, to all classes concerned in industrial pursuits, this work is one of the most valuable epitomes of information that has probably ever been published. Dr. Ure is perhaps better qualified than almost any other writer to render a work of this varied and useful description every thing that it ought to be. It forms an indispensable work of reference to men of science and manufacturers, for practical purposes, and to every reader who is incidentally interested in any of the numerous subjects of which it treats."—*ATHENÆUM*.

In the press, by the same Author,

RECENT IMPROVEMENTS IN ARTS, MANUFACTURES, AND MINES; being a Supplement to his Dictionary.

WALKER (GEO.)—CHESS STUDIES;

Comprising One Thousand Games of Chess, as really played by the first Chess Players; comprising a complete Encyclopedia of Reference, and presenting the greatest Collection extant of fine specimens of strategy in every stage of the Game. Selected and arranged by GEORGE WALKER, Author of "Chess made Easy," "A New Treatise on Chess," and other Works on the subject. 8vo. 10s. 6d. sewed.

"A very complete account of the game in modern times, which, as it has become more a rage than ever, and nations look on its contests with almost national passions, every chess player will find deserving of his best attention. No trial of skill, certainly, excites such earnest desire to conquer, and those who are ambitious of victory must study Walker."—*LITERARY GAZETTE*.

WARDLAW.—DISCOURSES ON THE PRINCIPAL POINTS

OF THE SOCINIAN CONTROVERSY—the Unity of God, and the Trinity of Persons in the Godhead; the Supreme Divinity of Jesus Christ; the Doctrine of the Atonement; the Christian Character, &c. By RALPH WARDLAW, D.D. 5th Edition, 8vo. 15s. cloth.

By the same Author,

SERMONS. 8vo. 12s. boards.

WATERTON.—ESSAYS ON NATURAL HISTORY,

Chiefly Ornithology. By CHARLES WATERTON, Esq., Author of "Wanderings in North America." With an Autobiography of the Author, and a View of Walton Hall. Fifth Edition, fcp. 8vo. 8s. cloth.

SECOND SERIES. With Continuation of Mr. WATERTON'S Autobiography. Fcp. 8vo. with Vignette by T. Creswick, A.R.A. 6s. 6d. cloth.

"It gives us hearty pleasure to meet with Mr. Waterton again. To miserable mortals 'close in populous cities pent,' his books are as a vigorous autumn air. He is a charming writer. Candid, cordial, good-hearted, and full of the most masculine sympathies. His AUTOBIOGRAPHY will rank with the most piquant and comprehensive pieces of that kind of writing in the language. His ESSAYS, with little of the learned pretences, have a store of cheerful wisdom in them which yields untiring instruction and pleasure."—*EXAMINER*.

WATHEN.—ARTS, ANTIQUITIES, AND CHRONOLOGY OF

ANCIENT EGYPT, from Personal Observations. By G. H. WATHEN, Architect. With Illustrations from Original Sketches by the Author. Royal 8vo. with Plates and Woodcuts, 16s. cloth.

"To commend or recommend Mr. Wathen's volume, after what we have extracted from it, would be superfluous. The antiquary, the scholar, the philosopher, the artist, in short, every educated man who reads, either for instruction or entertainment, must be interested in its rich and varied contents."—*ECLECTIC REVIEW*.

WESTWOOD.—INTRODUCTION TO THE MODERN CLASSI-

FICATION OF INSECTS; comprising an Account of the Habits and Transformations of the different Families; a Synopsis of all the British, and a Notice of the more remarkable Foreign Genera. By J. O. WESTWOOD, Sec. Ent. Soc. London, F.L.S., &c. 2 vols. illustrated with above 150 Woodcuts, comprising about 2500 distinct Figures, 22. 7s. cloth.

WEBSTER.—AN ENCYCLOPÆDIA OF DOMESTIC ECONOMY;

Comprising such subjects as are most immediately connected with Housekeeping: as, The Construction of Domestic Edifices, with the modes of Warming, Ventilating, and Lighting them—A description of the various articles of Furniture, with the nature of their Materials—Duties of Servants—A general account of the Animal and Vegetable Substances used as Food, and the methods of preserving and preparing them by Cooking—Making Bread—The Chemical Nature and the Preparation of all kinds of Fermented Liquors used as Beverage—Materials employed in Dress and the Toilette—Business of the Laundry—Description of the various Wheel Carriages—Preservation of Health—Domestic Medicine, &c. &c. &c. By THOMAS WEBSTER, F.G.S. &c.; assisted by the late Mrs. Parkes, Author of "Domestic Duties." 1 thick vol. 8vo. illustrated with nearly 1000 Woodcuts, 50s. cloth.

"The title-page sufficiently indicates the wide range of topics included in this most useful encyclopædia, and all are treated with a fulness which leaves nothing to be desired. It has been the object of the editor to combine science with practice, a knowledge of principles with the ordinary details and daily recurring duties of domestic life. In some departments of the work, Mr. Webster has been assisted by ladies whose qualifications are beyond dispute, and the result of their united labours is the production of a volume which exhausts the subject, and defies all competition. The work is richly illustrated with woodcuts, adding greatly to its value. We strongly recommend every lady, and all others who are concerned in the management of domestic affairs, to make themselves familiar with Mr. Webster's volume, which must speedily be regarded as an indispensable book of reference to every housekeeper."

ELLECTIC REVIEW.

WHITE'S COMPENDIUM OF THE VETERINARY ART;

Containing Plain and Concise Observations on the Construction and Management of the Stable; a brief and popular Outline of the Structure and Economy of the Horse; the Nature, Symptoms, and Treatment of the Diseases and Accidents to which the Horse is liable; the best method of performing various important Operations; with Advice to the Purchasers of Horses; and a copious Materia Medica and Pharmacopœia. 17th Edition, entirely reconstructed, with considerable Additions and Alterations, bringing the work up to the present state of Veterinary Science. By W. C. SPOONER, Veterinary Surgeon, &c. &c. 8vo. pp. 588, with Coloured Plate, 16s. cloth. London, 1842.

WHITE'S COMPENDIUM OF CATTLE MEDICINE;

Or, Practical Observations on the Disorders of Cattle and other Domestic Animals, except the Horse. 6th Edition, re-arranged, with copious Additions and Notes, by W. C. SPOONER, Vet. Surgeon, Author of a "Treatise on the Influenza," and a "Treatise on the Foot and Leg of the Horse," &c. 8vo. 9s. cloth.

WHITLEY.—THE APPLICATION OF GEOLOGY TO AGRICULTURE,

and to the Improvement and Valuation of Land: with the Nature and Properties of Soils, and the Principles of Cultivation. By NICHOLAS WHITLEY, Land-Surveyor. 8vo. 7s. 6d. cloth.

WILDE.—NARRATIVE OF A VOYAGE TO MADEIRA,

TENERIFFE, and along the SHORES OF THE MEDITERRANEAN. By W. R. WILDE, Surgeon, &c. &c. 2d Edition, corrected and enlarged, 8vo. with Illustrations, 18s. cloth.

WILKINSON.—THE ENGINES OF WAR, &c.

Being a History of Ancient and Modern Projectile Instruments and Engines of Warfare and Sporting; including the Manufacture of Fire-Arms, the History and Manufacture of Gunpowder, of Swords, and of the cause of the Damascus Figure in Sword Blades, with some Observations of Bronze; to which are added, Remarks on some Peculiarities of Iron, and on the Extraordinary Effect produced by the Action of Sea-water on Cast-Iron; with Details of various Miscellaneous Experiments. By H. WILKINSON, M.R.A.S. 1 vol. 8vo. 9s. cloth.

WILLOUGHBY (LADY).—A DIARY,

Purporting to be by the LADY WILLOUGHBY, of the Reign of Charles I.; embracing some Passages of her Domestic History from 1635 to 1648.

To give additional interest to the work, it has been printed and bound in the style of the period to which it refers. Small 4to. 18s. boards; or in morocco, by Hayday, £2. 2s.

"So rarely have we met in our literary walks with so sweet a character as the Lady Willoughby, that we know not whether the feeling of regret or pleasure has prevailed as we have closed the volume of her beautiful fragment. She looks out upon us from her opened casement with such freedom and beauty, that we are compelled to regard her with admiration and delight. There is no aim at strictness in what she has written, no indication of a woman's vanity: her whole manner is that of subdued grace and feminine loveliness. That the exquisite passages purporting to be extracts from her diary have flowed from a woman's pen, alone we cannot for a moment doubt. A woman only could have so justly and tenderly portrayed the character of an affectionate daughter, a gentle and loving wife, and a faithful and devoted mother. All the her ladyship, whether a real or an imaginary personage, has done, with a gracefulness and truth worthy of female nature in its best and loftiest mood. If her work is indeed only an imitation of a tale gone by, then the genius of Chatterton is far surpassed by that of the successful author. In taking leave of her unique and interesting book, we express our cordial hope that it will find its way to the toilette of every titled and untitled lady in Great Britain."—*BRITANNICAL MAGAZINE.*

WOOD.—A PRACTICAL TREATISE ON RAILROADS, AND

INTERIOR COMMUNICATION IN GENERAL; containing numerous Experiments on the Powers of the Improved Locomotive-Engines, and Tables of the comparative Cost of Conveyance on Canals, Railways, and Turnpike Roads. By NICHOLAS WOOD, Colliery Viewer, Memb. Inst. Civ. Eng. &c. Third edition, very greatly enlarged, with 13 large Plates, and several new Woodcuts. £1. 11s. 6d. cloth.

YOUNG LADIES' BOOK (THE):

A Manual of Elegant Recreations, Exercises, and Pursuits. 4th Edition, with numerous beautifully executed Engravings on Wood. £1. 1s. elegantly bound in crimson silk, lined with imitation of Mechlin lace.
